On the empirical reading, some proposal is reasonable from some particular person's point of view only if that person has beliefs and desires which, according to h/er own scheme of reasoning, support that proposal to the degree, which, by h/er standards, is required. There are multiple concessions to the individual's actual perspective embodied in this idea. First of all, we deal with the individual's actual beliefs and desires, not those that s/he would have if s/he were better informed, more committed to believing what is supported by evidence, less selfish, etc. We take the individual, *qua* believer and desirer, as we find h/er. Secondly, we ‘respect’ the individual's actual ways of reasoning, however ‘defective’ they might be from the point of view of formal theories of decision-making and inference. Thirdly, we accept as given the particular level of evidential and inferential adequacy that the individual h/erself sets; we don't require h/er to meet standards that we think are better from the point of view of formal rationality.

On the normative reading, all this is reversed, at least at the limit. Some proposal is reasonable for a particular individual, on this reading, if it conforms to the beliefs and desires that individual *would* have *if*___; if it is supported to the degree that s/he *would* demand *if*___; if it was developed in accordance with the inferential procedures she *would* use *if*___. In each case, ‘if’ s/he were ideally rational, at least up to the point at which, given fallibility and finitude, it makes sense to imagine h/er being.

A normative reading of the demands of public justification seems to recommend itself. Certainly, we don't have to embrace Marxist notions of *ideology* to realize that a purely empirical approach to legitimation is likely to fail in two opposed ways. (i) There are (pre-theoretically) illegitimate regimes that would be judged legitimate, on the empirical standard, on account of the population's believing and desiring what they shouldn't, and wouldn't if their thinking hadn't been corrupted--precisely by their membership of this community. (ii) There are (pre-theoretically) legitimate regimes that would be judged illegitimate, on the empirical standard, again on account of their population's believing and desiring what they shouldn't. Surely, a ‘normative’ approach must be preferred in view of these possibilities.

On the other hand, a ‘normative’ approach seems to be vulnerable on two counts. *First*, it presupposes an accessibly univocal reading of what it is reasonable to believe and desire and to infer from one's beliefs and desires with respect to public political arrangements. If there is ‘reasonable’ disagreement *about the demands of reason itself*, then potentially--and if so reasonably--groups within a community may have

different understandings of what is publicly justified within that community, and hence different notions of what institutions might be legitimate for that community. And, of course, it *is* arguable, at least, that reason does not pronounce univocally in disciplining our empirical beliefs, desires, and inferences, at least in the realm of human social arrangements. This, if you like, is the lesson of much philosophy of science and epistemology inspired by the work of Thomas Kuhn, who noted very clearly the possibilities (i) that different people might apply the standards of reason in different ways, and (ii) that their doing so was an important factor in the longer-term development of scientific understanding.

Secondly, a normative approach seems to abandon an important guiding principle of justificationist accounts of legitimacy--to wit, their responsiveness to broadly ‘voluntaristic’ considerations. As Thomas Nagel has pointed out, a regime which is publicly justified, although inevitably employing coercion to enforce its primary rules of association, has, on account of its being reasonable from every point of view, some of the advantages of a purely voluntary association. A ‘normative’ approach also seems to sever the historically important link between liberalism and anti-paternalistic thinking. If social arrangements are legitimately enforced against the actual ‘reasons’ of the populace, then this is, within a ‘normative’ framework, on account of the superiority of the theorist's understanding of the reasons for those people to embrace this regime. Obviously, this is a form of ‘patronage’.

Consensus/Convergence

A second basic ambiguity also can be detected in the phrase ‘reasonable from every point of view’. On the one hand, this might be read as invoking the notion of a *consensus* of grounding reasons. If **A** and **B** are members of a community for which a regime **S** is publicly justified, then, on this reading, there must be some reason **r**, which **A** has and **B** has too, which is their common (consensual) reason in relation to the regime **S**. On the other hand, this phrase might be read as invoking the notion of a *convergence* on a conclusion from a variety of distinct (sets of) premises. If **S** is reasonable from **A**'s point of view on account of **r**(**A**), then it may well be that it is reasonable from **B**'s point of view on account of an **r**(**B**) which is distinct from **r**(**A**).

Rawls's position on this matter is somewhat obscure. On the one hand, his preferred phrase, ‘overlapping consensus’, might suggest the first, consensual reading. On the other hand, other statements of his seem to suggest that, for instance, the Kantian's legitimating reasons for some regime might differ quite markedly from the utilitarian's or the Christian's, thus suggesting that the convergence interpretation is more faithful to his intentions. Nevertheless, the consensual reading might be the right one. In his book *Political Liberalism*, Rawls appears to suggest that the overlapping consensus which he has in mind is one of ‘reasonable’ doctrines. Roughly, these are doctrines which acknowledge or are at least compatible with the acknowledgement of (i) the ‘burdens of judgment’ (roughly, the reasonableness of disagreement over high-level issues in ethico-political and scientific investigations), and (ii) an obligation not to ‘free ride’ on working and mutually beneficial social arrangements. In fact, it is arguable that it is these constituents of ‘reasonableness’ that do the work in the Rawlsian derivation of principles of justice, and, hence, that what makes a regime embodying those principles legitimate is its conformity with an individual's commitment to being ‘reasonable’. In this case, the mode of justification *is* consensual, as

initial appearances would suggest.

Maximizing/Universalizing

A third basic ambiguity trades on different modalities of reason. Brian Barry and David Gauthier, for instance, both distinguish *maximizing* and *universalizing* conceptions of reason. Considering matters from the point of view of the maximizing conception, a regime might be legitimate, for an individual, for the reason that it (maximally) advances that individual's interests. Considering matters from the point of view of the universalizing conception, a regime might be legitimate, for an individual, for the reason that it fairly advances the interests of all as seen from that individual's point of view. Obviously, these two perspectives are distinct, at least superficially. On the one hand, the maximizing conception of public justification suggests a *negotiation* between parties in search of a stable equilibrium of opposed forces--each has been assigned, by a regime, as much as s/he can be assigned consistently with the need to assign enough to every party to secure h/er compliance. On the other hand, the universalizing conception suggests a *discourse* between the parties in search of an ideal that each can endorse as a public ideal for the community of which they are members. In the first case, we have individuals thinking as private agents about their individual welfare; in the second, we have individuals thinking as public deliberators about the common good. The first conception produces the public out of the private, much in the manner of Bernard Mandeville and Adam Smith, whereas the second conception presupposes (as in the case of Rawls's ‘reasonableness’) some prior public-spiritedness on the part of individuals. Jon Elster notes this distinction and labels it that between the market and the forum.

These three ambiguities provide the basis for a typology of styles of public justification, and, certainly, different approaches to public justification can be observed. Rawls and Gauthier are both proponents of public justification, but their approaches could hardly be more different. The typology developed here helps foreground the ways in which they are different--and to provide pigeon-holes for the accommodation of numerous other perspectives.

Of course, there is a problem implicit in this variety of different approaches to public justification. Suppose that we wonder whether a regime **S** is legitimate. We want to know whether we should give our willing commitment to its demands or, instead, hold ourselves in readiness to oppose these demands when circumstances permit this. Suppose we accept that public justification--reasonableness from every perspective--is the basis for legitimacy. Suppose someone suggests that **S** is legitimate because there is an actual empirical convergence of maximizing reasons in favor of **S**. Do we know now whether to conform or resist? Not necessarily. Someone else might come along with the information that there is no hypothetical (i.e. normatively informed) consensus of universalizing reasons in favor of **S**. The question of legitimacy is--so far, anyway--*indeterminate* because the notion on which it depends is ambiguous.

Prospects for Public Justification

The notion of legitimacy is a *practical* notion in the sense that it is meant to inform our decision to

acquiesce in or (try to) resist the demands of the political regime of which we are citizens. It is an important desideratum for such a notion that it facilitate the formation of determinate judgments--e.g. that the regime **S** *determinately* is (or isn't) a legitimate regime. As indicated, the notion of public justification may not satisfy this desideratum. Crudely, it is ambiguous, at least *prima facie* what is in accordance with reason in relation to social arrangements.

Some mechanisms developed by Rawls and put by him to other uses may be relevant in resolving this ambiguity. In *A Theory of Justice*, Rawls considers a related problem--posed by the fact that there is, in our society and societies like it, no *public conception of justice*. Of course, there is a shared *concept* of justice, but this is too vague and abstract to serve as a practical guide. And while there are *conceptions* of justice which are sufficiently specific to have concrete practical implications, there is no agreement about which of these is the ‘right’ one for the group as a whole. So far the analogy is obvious with the issue of public justification. There is widespread agreement on the concept, but a plurality of interpretations of that concept. What does Rawls suggest in this case? To determine which conception of **X** is best fitted to play the role of public conception of **X**, we ask which conception best embodies the *ideal* of **X**, where that is given by *functional analysis* of the concept and its role in collective life. (This method is most obvious at section 23 of *A Theory of Justice*, where Rawls sets out the "formal conditions that it seems reasonable to impose on the conceptions of justice".) A similar approach might be satisfactory in the case of public justification.

A functional analysis in relation to public justification reveals many different desiderata for any adequate public conception of that concept. In particular, it is reasonable, given the role of the idea of public justification, to expect that any public justification will capture the ‘double-sidedness’ of that concept. On the one hand, public justification does seek some distance from people's actual ‘reasons’, in search of genuine justification rather than specious rationalization. On the other hand, publicly justificatory arguments are meant to have an impact on the individuals which they target, and, in particular, to give them motives as well as reasons for conformity (or otherwise) to the demands they are subject to. (Stephen Macedo makes these points especially forcefully.) Unfortunately, there is *prima facie* incompatibility between these dual demands. To the extent that a given course of reasoning satisfies the demands for ‘normative distance’, to that extent is it likely to fail to meet the demands for motivational impact. In fact, there is a catalogue of such incompatibilities. (See D'Agostino, *Free Public Reason*, chapter 6.)

Of course, *prima facie* means ‘at first glance’. Perhaps there is some *canonical* way of balancing these competing demands and hence some public conception of what's required for public justification to be achieved. For reasons which Kuhn has suggested in another context, and which have already been alluded to, and which perhaps reflect elements of Lyotard's preferred ‘heterology’, it is hard to see how a ‘canonical trade-off’ amongst the various desiderata can in fact be identified. (See D'Agostino, *Free Public Reason*, chapter 7.) This means that the *prospects* are poor for public justification--and hence for discursive redemption of legitimacy claims--in societies like ours. Perhaps the Foucauldians and post-modernists are right in claiming that notions of legitimacy are inherently and inescapably themselves instruments of power, rather than ‘rational’ alternatives to force. Certainly, if there is no public conception of public justification, any regime is ‘legitimate’ only *given* a conception of legitimacy that is

itself controversial, and hence can be imposed only by force--not by the inducements of ‘reason’.

Contemporary Approaches to the Social Contract

The idea of the social contract goes back, in a recognizably modern form, to Thomas Hobbes, but is most notably embodied, in our times, in the work of John Rawls. The basic idea is a simple one. What makes some particular system of collectively enforced social arrangements *legitimate* is that it is the object of an agreement for the people who are subject to it. (As in the case of *public justification*, the key phrase, 'the object of an agreement', is multiply ambiguous.) In the case of a literal contract--say for an exchange of goods--each of the parties has reason to honor the terms of the contract either in the (bare) fact of having agreed to its terms (under certain circumstances) or in the fact of its terms being agreeable ones. Similarly, in the case of a social contract in the manner of Hobbes or Rawls, each of the parties has reason to honor h/er responsibilities under the terms of the contract--e.g. to pay taxes, conform to laws, participate in decision-making, etc.--either on account of h/er agreement to do so, or, perhaps, on account of its being reasonable that s/he do so. (These are what Michael Lessnoff calls the *voluntaristic* and *rationalistic* readings of the contract.) In its modern guises, contractarianism is not intended as an account of the historical origins of current social arrangements, but, instead, as an answer to, or framework for answering, questions about legitimacy and political obligation. Important issues associated with contractarianism include the binding force of hypothetical agreements, the reduction (or not) of ethico-political to instrumental reasoning, and the compatibility of contractarianism with fairness and liberty.

Hypothetical Contracts?

Contemporary contractarianism is, characteristically, *doubly* hypothetical. Certainly, no prominent

theorist thinks that questions of legitimacy and obligation are settled by an actual survey of attitudes towards existing social arrangements, and are not settled until such a survey has been carried out. The question, then, is NOT "Are these arrangements the object of an actual agreement amongst ‘stakeholders’?" (If this were the question, the answer would typically be "No".) The question, rather, is "*Would* these arrangements be the object of an agreement if ‘stakeholders’ were surveyed?" Although both of the questions are, in some sense, susceptible to an empirical ‘reading’, only the latter is in play in present-day theorizing. The contract nowadays is always hypothetical in at least this first sense.

There is a reading of the (first-order) hypothetical question "Would the arrangements be the object of agreement if___" which, as indicated, is still resolutely empirical in some sense. This is the reading where what's required of the theorist is that s/he try to determine what an actual survey of actual ‘stakeholders’ would reveal about their actual attitudes towards their system of social arrangements. (We don't really perform the survey, but we do perform it ‘in imagination’.) But there is another reading that is more widely accepted in the contemporary context. On this reading, the question, really, is no longer a hypothetical question about actual reactions; it is, rather, a hypothetical question about *hypothetical* reactions--it is, as I have said, *doubly* hypothetical. *Framing* the question is the first hypothetical element: "Would it be the object of agreement if they were surveyed?" *Framed by* this question is the second hypothetical element, one which involves the so-called ‘stakeholders’, who are no longer treated ‘empirically’, i.e. taken as given, but are, instead, themselves considered from a hypothetical point of view--as they would be if (typically) they were better informed or more impartial, etc. The question for most contemporary contractarians, then, is, roughly, this. "If we surveyed the ‘idealized surrogates’ of the actual ‘stakeholders’ in this polity, would current social arrangements be the object of an agreement for them?" A "Yes" answer confers legitimacy and imposes obligations; a "No" answer signals illegitimacy and relieves us of or shows the purely ‘historical’ status of obligations that we might now submit to.

Of course, questions arise--and have been raised most notably by Ronald Dworkin--about how a (doubly) hypothetical agreement can bind any actual person. The point of second-stage hypotheticalizing is, *inter alia*, that, as I actually am, I would *not* agree to be bound by some system of social arrangements **S**. Suppose that it could be shown, however, that my ‘surrogate’ (a better informed, more impartial version of me) would agree to be bound by **S**. What has that to do with me? Where this second-stage hypotheticalization is employed, it seems to be proposed that *I* can be bound by agreements that *others*, different from me, would have made. It is like saying that I ought to be bound to respect **S** on account of *your* having agreed to be bound by **S**. While it might (though it needn't) be reasonable to suppose that I can be bound by agreements that I would myself have entered into if given the opportunity, it is just crazy to think that I can be bound by agreements that, demonstrably, I wouldn't have made *even if* I had been asked.

Rawls's solution to this problem reflects the complexity of his *original position argumentation* and the idea of *reflective equilibrium* which it depends on. In effect, Rawls identifies *two contracts*, one framing the other. The ‘first’ contract is one that, as we actually are, each of us makes with the ‘surrogate’ who is to represent us in second-stage contractual reasoning. As I am, I agree that the question is NOT "Do I agree as I actually am to **S**?" but, instead, "Would I agree if I were ___ to **S**?", or, in other words, "Will I

be bound by agreements that will be made in respect of **S** by my ‘idealized surrogate’ (or better self)?" Once I have answered "Yes" (of course hypothetically; there is no actual survey) to the first, framing question, I will be bound to the demands of **S** so long as my idealized surrogate--the subject of the second, framed (and still hypothetical) contractual question--says "Yes" to the system **S** of social arrangements. (This is what Rawls means when he characterizes the parties to the original position as ‘trustees’ for the interests of ‘you and me’.) Crudely, the reasoning runs as follows. I agree to be represented by **X** for certain purposes; **X** agrees that the system **S** is a legitimate one; hence I am bound by this system, for my ‘trustee’ has agreed to it on my behalf--this is one of the purposes for which s/he was to represent me. As Rawls says (*A Theory of Justice*, p.587): "Finally, we may remind ourselves that the hypothetical nature of the original position invites the question: why should we take any interest in it, moral or otherwise. Recall the answer: the conditions embodied in the description of this situation are ones that we do in fact accept."

Reductionism?

Contemporary contractarians tend to be *constructivists* in the sense that they recognize no independent and determinate external standard of legitimacy that the contractual device is intended to approximate, but, rather, make the truth-maker for "**S** is legitimate" that **S** was the object of an agreement (for ‘stakeholders’ or their surrogates). Crudely, being agreed to makes a regime legitimate; it is not that being agreed to is evidence for legitimacy otherwise conceived.

Within this constructivist framework, there are two main schools of contractarian thinking, which reflect differences which were already apparent between Hobbes's approach and John Locke's.

On the one hand, we have those contractarians, such as David Gauthier and James Buchanan, who think that legitimacy of regimes is determined by their prudential acceptability from the diverse points of view that are represented in relevant communities. On this account, the *basis* for an individual's agreement, and hence for h/er judgment that the regime is a legitimate one is that enforcement of the regime's demands contributes to the realization of h/er aspirations. On this account, to say "**S** is legitimate" is to say, more or less, that **S** is good for its various members. This is a *prudential* account of legitimacy and, if we think that prudence is a more ‘basic’ idea than the ideas of ‘morality’, then this approach is *reductionistic* in the sense that it derives ethico-political notions like ‘legitimacy’ and ‘obligation’ from non-ethico-political notions such as acceptance-grounded-on-prudence. Insofar as there is some problem in understanding how genuinely ethico-political reasons can also function as *motives* (alleged to be a problem on cognitivist interpretations), such a reductionistic strategy may be appealing; there is alleged to be little trouble understanding how purely prudential reasons can serve as motives--though, of course, this is a common assumption, rather than a demonstrated conclusion.

On the other hand, some contractarians, most notably Rawls, already build ethico-political assumptions into their particular approach to hypotheticalization. The kinds of ‘surrogates’ which ‘you and I’ commission to act as our agents in reasoning about legitimacy are, on Rawls's account, already so situated that their deliberations will be framed by ethico-political considerations. (See the article

"Original Position". The agents' deliberations are carried out in purely prudential terms, but they are subject to the ‘veil of ignorance’, which itself embodies important ethico-political notions.) Indeed, it can fairly be said that *any* approach to contractarian thinking that substitutes ‘impartial’ surrogates for concrete individuals is anti-reductionist in this way. (As Rawls himself points out, some broadly utilitarian approaches to legitimacy can be conceptualized as involving a hypothetical contract. The assumptions that John Harsanyi, for instance, makes in developing his version of the social contract make his approach an anti-reductionistic one.)

Challenges

Bruce Ackerman has mounted a profound challenge to contractarian thinking. It works, crudely, on the idea that the premises of a course of contractarian reasoning can be manipulated so as to yield (more or less) any conclusion that the theorist has some antecedent interest in producing. The argument goes as follows. Each version of contractarianism must specify three features: (i) the chooser **c**, (ii) the situation of choice **C**, and (iii) the alternatives **A** from which a choice is made. If **c** chooses **S** from **A** in **C**, then this establishes the legitimacy of **S** only *relative to* the specification of chooser, situation, and choice-set, and hence could be overturned, absent further constraints on the situation, by alternative specifications. Most obviously, if the choice-set is arbitrarily confined to **S** and various alternatives that are chosen by the theorist for their utterly unacceptable character, then any selection of **S** from **A** is meaningless as a legitimator. (The trick could be worked as easily, though not as transparently perhaps, by restricting the characterization of **c** or of **C**.) Perhaps the solution to this problem is simply to lift all restrictions on **C**, **A**, and **c**, hence banishing all arbitrary elements. If *all* the alternatives are canvassed and if the chooser isn't biased for or against any of them, then, surely, the fact that h/er choice was **S** does indeed confer legitimacy. However, as Ackerman points out, this won't work either, for, with no limits on **A**, and with no biasing--and hence distinguishing--characteristics built into **c**, there can be no choice at all.

Ackerman only considers two possibilities: (i) that contractarian thinking is unrestricted--but, if so, utterly empty; (ii) that contractarian thinking is ‘rigged’--but, if so, utterly devoid of normative force. However, there may be a non-arbitrary, non-empty form of such reasoning. This, anyway, is what Rawls thinks. He certainly doesn't permit ‘unrestricted’ reasoning about legitimacy; his deliberators in the original position are (surrogate) maximizers of social primary goods, reasoning in accordance with certain ethico-politically significant constraints--a veil of ignorance embodying a concept of justice. On the other hand, although the course of reasoning does make concrete assumptions about choosers, choice-situations, and choice-sets, the assumptions it makes, or so Rawls claims, are ones that we share. So while they might be arbitrary *sub specie aeternitatis*, they are not arbitrary from the point of view of the concrete individuals on whose behalf they are made. As these individuals see it, these particular assumptions are ‘privileged’ at least in the sense that they represent current community attitudes about justice. A demonstration of legitimacy is *relative to* these assumptions, but, since they are the best the community can do, there is nothing untoward about this. (This raises, but does not solve, the problem of ‘ideology’--i.e. that the community's very notion of justice is already corrupted. Notice that, within a constructivist framework, this judgment can itself be made only from the point of view of another community's concept of justice--a concept that might itself also be ‘corrupted’.)

Robert Nozick also mounts a powerful challenge to contractarian thinking, at least of the kinds that Rawls represents. His argument proceeds in three stages. (1) Nozick distinguishes ‘end-state principles’ of social life from ‘historical principles’. An end-state principle says, in effect, that a situation **S** is legitimate only if it approximates a particular canonical state of affairs **S***. An historical principle, on the other hand, says that any state is legitimate, whatever it might be substantively, so long as it has been reached from previous states by processes which are themselves legitimate. (2) Nozick notes that end-state judgments of legitimacy are very volatile in changing circumstances, and, hence, that ensuring continued legitimacy could, on this account, involve such arbitrarily large restrictions of liberty as to be unacceptable. (3) Nozick then notes that contractarian thinking, at least of the Rawlsian kind, delivers up end-state principles of legitimacy, and hence must be rejected--on account of point (2).

Nozick's argument is most vulnerable on point (2). It is true that Rawls's particular argument does yield an end-state principle in the form of the ‘difference principle’. And it certainly seems likely that continued legitimacy, by this standard, might require large impositions on individuals' liberties. But these considerations only establish that liberty and fairness may need to be traded off against one another in uncongenial ways, as Isaiah Berline had, of course, long ago pointed out; they do not establish a decisive objection to the contractarian approach.

Original Position

The idea of the original position is perhaps the most lasting contribution of John Rawls to our theorizing about social justice. The original position is a hypothetical situation in which rational calculators, acting as agents or trustees for the interests of concrete individuals, are pictured as choosing those principles of social relations under which their principals would do best. Their choices are subject to certain constraints, however, and it is these constraints which embody the specifically moral elements of original position argumentation. Crudely, the rational calculators do not know facts about their principals which would be morally irrelevant to the choice of principles of justice. This restriction on their reasoning is embodied, picturesquely, in Rawls's so-called *veil of ignorance*, which occludes information, for instance, about principals' age, sex, religious beliefs, etc. Once this information about principals is unavailable to their agents, the plurality of interested parties disappears, and the problem of choice is rendered determinate. According to Rawls, agents so situated would choose two principles of justice, lexically ordered, affirming the equality of basic rights and an approach to social inequalities governed by the ‘difference principle’, according to which inequalities are unjust unless removing them would worsen the situations of the worst-off members of society. Original position argumentation is an example of contemporary contractarianism, involves a pure-proceduralist approach to the determination of moral principles, and is framed by reflective equilibration with widely agreed principles of public morality.

Reflective Equilibrium

There are *epistemological* and *political* interpretations of the original position.

On the epistemological reading, the original position is a methodological device for ridding the ethico-political ‘observer’ of hindrances to h/er clear and distinct perception of ethico-political facts. Just as it may be necessary to employ prosthetic sensory devices to make observations of distant or minute objects

or to use techniques of controlled experimentation to eliminate the influence of ‘noise’ and theoretically irrelevant confounding variables, so too, on this reading, might it be necessary, in order clearly to observe the ethico-political facts, to use some such device as the original position. Indeed, the original position might be well adapted to such a task. Eliminating knowledge of personal characteristics eliminates the possibility of bias in favor of those characteristics and thus enforces the kind of *impartiality* or disinterestedness that is held to be integral to a moral perspective. (In this regard, as Rawls himself recognizes, the original position device resembles that of ideal spectator theorists.)

This epistemological reading is nevertheless not the interpretation of the original position favored by Rawls himself. Although he has not repudiated the kind of ethico-political ‘realism’ that is presupposed by this reading, he believes that, since ‘realism’ in this sense is a reasonably disputed doctrine, a *practical* approach to the task of ethico-political justification must ‘prescind’ from the realism/non-realism debate within ethico-political meta-theory. Since there is reasonable disagreement about realism, we cannot presuppose it in the context of *public* political disputation. (On account of the ‘burdens of judgment’, we cannot expect to resolve the debate about realism to the (reasonable) satisfaction of every reasonable person; this doctrine therefore cannot provide a basis for *political* theorizing.)

On the political reading, the original position is a ‘device of representation’. Specifically, it represents, in the veil of ignorance, widely accepted principles for the choice of principles of justice. More concretely, the veil of ignorance embodies the *concept* of justice--i.e. the idea that distributions should not be based on morally irrelevant features. The information occluded by the veil of ignorance is, precisely, the community's understanding of what features are morally *ir*relevant to the choice of principles of justice. Although members of a given community may disagree about many matters relevant to issues of justice, they share--or are alleged or assumed to share--an understanding of justice that, while insufficiently concrete or detailed to provide on its own a workable *conception* of justice, *is* adequate to the task of framing the choice of such a conception. Working within the framework defined by the veil of ignorance and derived from this widely shared concept of justice, rational calculators choose principles of justice on the basis of their fiduciary duty to the concrete individuals whom they represent. Their choice is not of an ‘objectively correct’ conception of justice; it is, rather, of that conception which best expresses a shared understanding of justice in the community whose members they represent.

Rawls's idea of reflective equilibrium expresses this political understanding of justification. How are we to justify the claim that some particular conception of justice is the appropriate one? We are to do so, according to Rawls, by finding that conception which can be brought into reflective equilibrium with the *considered judgments of justice* which are current in a particular community. Of course, the process of reflective equilibration is dialectical. The main moments of the process are these.

- We articulate the concept of justice which is widely accepted within a given community.
- We so devise the veil of ignorance that it embodies this concept.
- We consider what implications about concrete and specific matters of justice rational calculators standing in a trustee relation would reach subject to the particular restrictions on their calculations represented by *this* veil of ignorance.
- We compare these implications with individuals' considered judgments of justice about these more

concrete and specific issues.
- Where there is divergence between implications and judgments, we consider whether individuals might be willing to alter their judgments to bring them into line with principles which, after all, already express their own more abstract views about the concept of justice.
- If there is residual divergence, we modify the veil of ignorance to minimize this divergence.

These operations are repeated until eliminable divergence is at a minimum; this is the state of reflective equilibrium. Individuals' concrete and specific judgments about justice are in equilibrium with those of other individuals, and all individuals in the community share both an abstract concept of justice (embodied in the veil) and a workable *public conception* of justice.

Early discussants assumed that the method of reflective equilibration was to be understood epistemologically. Even in *A Theory of Justice*, there was much textual support for the alternative political reading, but, whatever the situation in the early 1970s, it soon became clear that Rawls's preferred reading was indeed the political one. There are two stories about the development of Rawls's thinking. On the one hand, some commentators believe that Rawls had adopted an epistemological, specifically Kantian, approach to ethico-political justification in his earlier work, at least up to *A Theory of Justice*, which he then abandoned under the pressure of communitarian, specifically Hegelian, criticism at the hands, in particular, of Michael Sandel. On the other hand, some commentators believe that Rawls's position, at least since *A Theory of Justice*, has remained resolutely political, and that any genuine development of his thought has been prompted by considerations internal to his own perspective. (Rawls seems, in *Political Liberalism*, to endorse this latter reading of the history.)

For the mature Rawls (and perhaps too for the Rawls of *A Theory of Justice*), all ethico-political justification, in public contexts, is unavoidably politically rather than epistemologically based. It is based, in other words, on a convergence--or as Rawls calls it, an *overlapping consensus* of the main substantive ethico-political doctrines current in a community. Absent such a basis for convergence, there is no possibility of discovering, via reflective equilibration, principles of justice which can effectively regulate interactions between and distributions to the members of the community. And since such disagreement would make improbable any uncoerced acceptance of some epistemologically sanctioned set of principles, no voluntaristic basis for social justice could be found in this community--even if an ‘objective’ basis could be.

Pure Proceduralism

The method of original position argumentation is an example of pure proceduralism in ethico-political theorizing. This aspect of Rawls's work seems not to have been adequately conceptualized, but it is crucial for understanding larger issues.

Imagine that there is for a particular community a public conception of the good. In this case, it might be possible to develop rules for the distribution of goods and services on a broadly *teleological* basis. That is right (whether action or distribution or institution) whose implementation maximizes the realization of

the good. Of course, the availability of a public conception of the good is not, perhaps, a sufficient condition for the viability of such a teleological approach. Even given such a conception, a teleological approach may still be insufficiently sensitive to distributional issues. And, indeed, this is *one* reason why Rawls rejects a teleological approach to ethico-political justification. But Rawls also argues on other grounds against a teleological approach. In particular, he thinks that no such approach is viable (i) because the availability of a public conception of the good *is* a necessary condition for the viability of such an approach, and (ii) because there is no such public conception of the good in our society and in societies like it.

If we cannot develop ethico-political principles of right and justice on a teleological basis, then how can we do so? According to Rawls, we can do so via original position argumentation, framed with considerations of reflective equilibrium. That is right and just which would be acknowledged as such from the point of view of the original position. And what makes being acknowledged from this point of view the ‘right-maker’ for principles of justice? Because this point of view is the appropriate one for determining principles of justice, on account of its reflecting the community's existing concept of justice--on account of its reflecting their overlapping consensus of views about justice.

Notice that there is no teleological reasoning at work here. The right-maker for principles of justice is not defined in terms of the consequences for the realization of the good of conformity with those principles. The right-maker is (hypothetical) acceptance from a particular point of view. The right-maker for principles, in other words, is their being the ‘output’ of a particular procedure, in particular the procedure of original position argumentation. The reasoners in the original position are not trying, through their deliberations, to ensure an outcome that meets some already existing standard of justice for institutions. Why not? Because there is no such standard until it is constructed by their deliberation. And there is no such standard because there is pre-existing consensus within the community on *neither* a conception of the good--which, were it to exist, might permit a perfectly or imperfectly procedural approach to determining the principles of right, *nor* a full-blown conception of justice--which, were it to exist, would render any further reasoning otiose.

Veil of Ignorance

Far and away the most striking feature of Rawls's original position idea is the veil of ignorance. As Rawls points out, the idea of an *initial situation* of choice for ethico-political principles is common to other approaches, and represents a hypotheticalization of familiar reasoning within the *social contract* tradition. What is particularly interesting about Rawls's approach is that he proposes to restrict the basis for reasoning rather than expanding it, which is, for instance, the approach taken within the *ideal spectator* framework.

Crudely, ideal-spectator theorists make two theoretical ‘moves’ which Rawls more or less reverses. Recognizing that ethico-political thinking ought to be conducted from an impartial perspective, ideal-spectator theorists capture this notion of impartiality by amalgamating ethically-relevant information about *all* relevant parties--e.g. all the members of some community, and by assuming that the spectator in

whom this information is lodged makes h/er determination of principles on an equitable basis--e.g. in assigning equal weights to information about the preferences of individuals. There are various reasons for wondering whether this procedure is really a coherent one. Most notably, assumptions about the spectator's ability to store and synthesize information and calculate on its basis are wildly unrealistic. (See Cherniak 1986.) Furthermore, the spectator's calculations not only permit, they force h/er to reckon inter-personal gains and losses in the same way that a purely prudential self-interested reasoner would reckon *intra*-personal gains and losses. This is problematic for two reasons, one of which Rawls himself emphasizes. First of all, and this is Rawls's primary objection, such a procedure forces the spectator to sacrifice one individual's interests to those of others, *theoretically without limit*, whenever doing so would result in the maximization of the total the spectator is calculating. Secondly, the idea is suspect, to say the least, that there is some basis for the commensuration of individuals' diverse ways of valuing that would permit the determination of some socially valid aggregate for each of the various states of affairs which are being evaluated.

Crudely, Rawls hopes to avoid these difficulties by reversing the ‘moves’ of the spectator theorist. Instead of augmenting the information available to choosers, Rawls deliberately impoverishes it. Instead of requiring choosers to be impartial, he requires them to be purely self-interested--though, of course, in an extended sense; his choosers act to advance the interests of their principals. And by requiring unanimity among the various trustees or agents, Rawls ensures that individuals' interests are not sacrificed to that of ‘the collective’; each individual can veto, through h/er agent/trustee, any social settlement that isn't adequately respectful of h/er individuality. The veil of ignorance is of importance in this context. It ensures impartiality, despite the self-interestedness of the choosers, by preventing them, through lack of knowledge, from choosing in accordance with partial perspectives that might be favored by their principals. My agent **A** cannot hold out for some social settlement that favors people with those characteristics; s/he doesn't know what they are. S/he will therefore have to protect *my* interests, as s/he must as their trustee, only by holding out for a social settlement in which *no one's* interests are given short shrift. H/er impartiality is a product of h/er self-interestedness plus h/er ignorance. And the latter, crucial to this procedure, is a product of the veil of ignorance.

This account of matters also enables us to clear up a confusion that was often voiced in the first few years after the publication of *A Theory of Justice*. It was said that Rawls had sought--as others such as David Gauthier do seek--to reduce ethico-political principles of right to principles of prudence. This on account of the purely self-interested deliberations of choosers in the original position. What this suggestion ignores is that, though the choosers *reason* in a purely prudential way, their reasoning is *constrained* by their ignorance, and their ignorance is *expressive* of the moral demand for impartiality.

John Locke

John Locke (b. 1632, d. 1704) was a British philosopher, Oxford academic and medical researcher, whose association with Anthony Ashley Cooper (later the First Earl of Shaftesbury) led him to become successively a government official charged with collecting information about trade and colonies, economic writer, opposition political activist, and finally a revolutionary whose cause ultimately triumphed in the Glorious Revolution of 1688. Much of Locke's work is characterized by opposition to authoritarianism. This opposition is both on the level of the individual person and on the level of institutions such as government and church. For the individual, Locke wants each of us to use reason to search after truth rather than simply accept the opinion of authorities or be subject to superstition. He wants us to proportion assent to propositions to the evidence for them. On the level of institutions it becomes important to distinguish the legitimate from the illegitimate functions of institutions and to make the corresponding distinction for the uses of force by these institutions. The positive side of Locke's anti-authoritarianism is that he believes that using reason to try to grasp the truth, and determining the legitimate functions of institutions will optimize human flourishing for the individual and society both in respect to its material and spiritual welfare. This in turn, amounts to following natural law and the fulfillment of the divine purpose for humanity. Locke's monumental *An Essay Concerning Human Understanding* concerns itself with determining the limits of human understanding in respect to God, the self, natural kinds and artifacts, as well as a variety of different kinds of ideas. It thus tells us in some detail what one can legitimately claim to know and what one cannot. Locke also wrote a variety of important political, religious and educational works including the *Two Treatises of Civil Government*, the *Letters Concerning Toleration*, *The Reasonableness of Christianity* and *Some Thoughts Concerning Education*.

1. Historical Background and Locke's Life

John Locke (1632-1704) was one of the greatest philosophers in Europe at the end of the seventeenth century. Locke grew up and lived through one of the most extraordinary centuries of English political and intellectual history. It was a century in which conflicts between Crown and Parliament and the overlapping conflicts between Protestants, Anglicans and Catholics swirled into civil war in the 1640s. With the defeat and death of Charles I, there began a great experiment in governmental institutions including the abolishment of the monarchy, the House of Lords and the Anglican church, and the establishment of Oliver Cromwell's Protectorate in the 1650s. The collapse of the Protectorate after the death of Cromwell was followed by the Restoration of Charles II -- the return of the monarchy, the House of Lords and the Anglican Church. This period lasted from 1660 to 1688. It was marked by continued conflicts between King and Parliament and debates over religious toleration for Protestant dissenters and Catholics. This period ends with the Glorious Revolution of 1688 in which James II was driven from England and replaced by William of Orange and his wife Mary. The final period during which Locke lived involved the consolidation of power by William and Mary, and the beginning of William's efforts to oppose the domination of Europe by the France of Louis XIV, which later culminated in the military victories of the John Churchill -- the Duke of Marlborough.

1.1 Locke's Life up to His Meeting with Lord Ashley in 1666

Locke was born in Wrington to Puritan parents of modest means. His father was a country lawyer who served in a cavalry company on the Puritan side in the early stages of the English civil war. His father's commander, Alexander Popham, became the local MP, and it was his patronage which allowed the young John Locke to gain an excellent education. In 1647 Locke went to Westminster School in London. The importance of Westminster school in the intellectual life of the seventeenth century can scarcely be exaggerated. Locke was a King's Scholar. The King's Scholars were a small group of special boys who had the privilege of living in the school and who received a stipend for two or three years before standing

for election for either Christ Church, Oxford or Trinity College Cambridge. While the "major elections" were probably political, the "minor elections or "challenges" were among the most genuinely competitive admissions processes in English schools of the period. Locke did not succeed in the challenge until 1650.

From Westminster school he went to Christ Church, Oxford, in the autumn of 1652 at the age of twenty. As Westminster school was the most important English school, so Christ Church was the most important Oxford college. Education at Oxford was medieval. Reform came, but not in Locke's time there. The three and a half years devoted to getting a B.A. was mainly given to logic and metaphysics and the classical languages. Conversations with tutors, even between undergraduates in the Hall were in Latin. Locke, like Hobbes before him, found the Aristotelian philosophy he was taught at Oxford of little use. There was, however, more at Oxford than Aristotle. The new experimental philosophy had arrived. John Wilkins, Cromwell's brother in law, had become Warden of Wadham College. The group around Wilkins was the nucleus of what was to become the English Royal Society. The Society grew out of informal meetings and discussion groups and moved to London after the Restoration and became a formal institution in the 1660s with charters from Charles II. The Society saw its aims in contrast with the Scholastic/Aristotelian traditions that dominated the universities. The program was to study nature rather than books.[1] Many of Wilkins associates were people interested in pursuing medicine by observation rather than the reading of classic texts. Bacon's interest in careful experimentation and the systematic collection of facts from which generalizations could be made was characteristic of this group. One of Locke's friends from Westminster school, Richard Lower, introduced Locke to medicine and the experimental philosophy being pursued by the virtuosi at Wadham.

Locke received his B.A. in February 1656. His career at Oxford, however, continued beyond his undergraduate days. In June of 1658 Locke qualified as a Master of Arts and was elected a Senior Student of Christ Church College. The rank was equivalent to a Fellow at any of the other colleges, but was not permanent. Locke had yet to determine what his career was to be. Locke was elected Lecturer in Greek at Christ Church in December of 1660 and he was elected Lecturer in Rhetoric in 1663. At this point, Locke needed to make a decision. The statutes of Christ Church laid it down that fifty five of the senior studentships should be reserved for men in orders or reading for orders. Only five could be held by others, two in medicine, two in law and one in moral philosophy. Thus, there was good reason for Locke to become a clergyman. Locke decided to become a doctor.

John Wilkins had left Oxford with the Restoration of Charles II. The new leader of the Oxford scientific group was Robert Boyle. He was also Locke's scientific mentor. Boyle (with the help of his astonishing assistant Robert Hooke) built an air pump which led to the formulation of Boyle's law and devised a barometer as a weather indicator. Boyle was, however, most influential as a theorist. He was a mechanical philosopher who treated the world as reducible to matter in motion. Locke read Boyle before he read Descartes. When he did read Descartes, he saw the great French philosopher as providing a viable alternative to the sterile Aristotelianism he had been taught at Oxford. In writing *An Essay Concerning Human Understanding* Locke adopted Descartes' ‘way of ideas’; though it is transformed so as to become an organic part of Locke's philosophy. Still, while admiring Descartes, Locke's involvement with the Oxford scientists gave him a perspective which made him critical of the rationalist elements in Descartes' philosophy.

In the Epistle to the Reader at the beginning of the *Essay* Locke remarks:

> The commonwealth of learning is not at this time without master-builders, whose mighty designs, in advancing the sciences, will leave lasting monuments to the admiration of posterity: but every one must not hope to be a Boyle or a Sydenham; and in an age that produces such masters as the great Huygenius and the incomparable Mr. Newton, with some others of that strain, it is ambition enough to be employed as an under-labourer in clearing the ground a little, and removing some of the rubbish that lies in the way to knowledge ... (pp. 9-10. All quotations are from the Nidditch edition of *An Essay Concerning Human Understanding*.)

Locke knew all of these men and their work. Locke, Boyle and Newton were all founding or early members of the English Royal Society. It is from Boyle that Locke learned about atomism (or the corpuscular hypothesis) and it is from Boyle's book *The Origin of Forms and Qualities* that Locke took the language of primary and secondary qualities. Sydenham was one of the most famous English physicians of the 17th century and Locke did medical research with him. Locke read Newton's *Principia Mathematica Philsophiae Naturalis* while in exile in Holland, and consulted Huygens as to the soundness of its mathematics. Locke and Newton became friends after Locke's return from Holland in 1688. It may be that in referring to himself as an ‘under-labourer’, Locke is not only displaying a certain literary modesty, he is contrasting the positive discoveries of these men, with his own attempt to show the inadequacies of the Aristotelian and Scholastic and to some degree the Cartesian philosophies. There are, however, many aspects of Locke's project to which this image of an under-labourer does not do justice. (See Jolley 1999, pp. 15-17) While the corpuscular philosophy and Newton's discoveries clearly influenced Locke, it is the Baconian program of producing natural histories that Locke makes reference to when he talks about the *Essay* in the Introduction. He writes:

> It shall suffice to my present Purpose, to consider the discerning Faculties of a Man, as they are employ'd about the Objects, which they have to do with: and I shall imagine that I have not wholly misimploy'd my self in the Thoughts I shall have on this Occasion, if in this Historical, Plain Method, I can give any Account of the Ways, whereby our Understanding comes to attain those Notions of Things, and can set down any Measure of the Certainty of our Knowledge... (I. 1. 2., pp. 43-4 -- the three numbers, are book, chapter and section numbers respectively, followed by the page number in the Nidditch edition.)

The ‘Historical, Plain Method’ is apparently to give a genetic account of how we come by our ideas. Presumably this will reveal the degree of certainty of the knowledge based on such ideas. Locke's own active involvement with the scientific movement was largely through his informal studies of medicine. Dr. David Thomas was his friend and collaborator. Locke and Thomas had a laboratory in Oxford which was very likely, in effect, a pharmacy. In 1666 Locke had a fateful meeting with Lord Ashley as a result of his friendship with Thomas. Ashley, one of the richest men in England, came to Oxford. He proposed to drink some medicinal waters there. He had asked Dr. Thomas to provide them. Thomas had to be out

of town and asked Locke to see that the water was delivered. Locke met Ashley and they liked one another. As a result of this encounter, Ashley invited Locke to come to London as his personal physician. In 1667 Locke did move to London becoming not only Lord Ashley's personal physician, but secretary, researcher, political operative and friend. Living with him Locke found himself at the very heart of English politics in the 1670s and 1680s.

1.2 Locke and Lord Shaftesbury 1666 to 1688

Locke's chief work while living at Lord Ashley's residence, Exeter House, in 1668 was his work as secretary of the Board of Trade and Plantations and Secretary to the Lords Proprietors of the Carolinas. Lord Ashley was one of the advocates of the view that England would prosper through trade and that colonies could play an important role in promoting trade. Ashley persuaded Charles II to create a Board of Trade and Plantations to collect information about trade and colonies, and Locke became its secretary. In his capacity as the secretary of the Board of Trade Locke was the collection point for information from around the globe about trade and colonies for the English government. Among Ashley's commercial projects was an effort to found colonies in the Carolinas. In his capacity as the secretary to the Lords Proprietors, Locke was involved in the writing of the fundamental constitution of the Carolinas. There is some controversy about the extent of Locke's role in writing the constitution.[2] In addition to issues about trade and colonies, Locke was involved through Shaftesbury in other controversies about public policy. There was a monetary crisis in England involving the value of money, and the clipping of coins. Locke wrote papers for Lord Ashley on economic matters, including the coinage crisis.

While living in London at Exeter House, Locke continued to be involved in philosophical discussions. He tells us that:

> Were it fit to trouble thee with the history of this Essay, I should tell thee, that five or six friends meeting at my chamber, and discoursing on a subject very remote from this, found themselves quickly at a stand, by the difficulties that rose on every side. After we had awhile puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts that we took a wrong course; and that before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and see what objects our understandings were, or were not, fitted to deal with. This I proposed to the company, who all readily assented; and thereupon it was agreed that this should be our first inquiry. Some hasty and undigested thoughts, on a subject I had never before considered, which I set down against our next meeting, gave the first entrance into this Discourse; which having been thus begun by chance, was continued by intreaty; written by incoherent parcels; and after long intervals of neglect, resumed again, as my humour or occasions permitted; and at last, in a retirement where an attendance on my health gave me leisure, it was brought into that order thou now seest it. (Epistle to the Reader, p. 7)

James Tyrrell, one of Locke's friends was at that meeting. He recalls the discussion being about the principles of morality and revealed religion. (Cranston, 1957, pp. 140-1) Thus the Oxford scholar and

medical researcher came to begin the work which was to occupy him off and on over the next twenty years.

In 1674 after Shaftesbury had left the government, Locke went back to Oxford, where he acquired the degree Bachelor of medicine, and a license to practice medicine, and then went to France. (Cranston, 1957. p. 160) In France Locke went from Calais to Paris, Lyons and on to Montpellier, where he spent the next fifteen months. Much of Locke's time was spent learning about Protestantism in France. The Edict of Nantes was in force, and so there was a degree of religious toleration in France. Louis XIV was to revoke the edict in 1685 and French Protestants were then killed or forced into exile.

While Locke was in France, Shaftesbury's fortunes fluctuated. In 1676 Shaftesbury was imprisoned in the tower. His imprisonment lasted for a year. In 1678, after the mysterious murder of a London judge, informers (most notably Titus Oates) started coming forward to reveal a supposed Catholic conspiracy to assassinate the King and put his brother on the throne. This whipped up public anti-Catholic frenzy and gave Shaftesbury a wide base of public support for excluding James, Duke of York from the throne. Though Shaftesbury had not fabricated the conspiracy story, nor did he prompt Oates to come forward, he did exploit the situation to the advantage of his party. In the public chaos surrounding the sensational revelations, Shaftesbury organized an extensive party network, exercised great control over elections, and built up a large parliamentary majority. His strategy was to secure the passage of an Exclusion bill that would prevent Charles II's Catholic brother from becoming King. Although the Exclusion bill passed in the Commons it was rejected in the House of Lords because of the King's strong opposition to it. As the panic over the Popish plot receded, Shaftesbury was left without a following or a cause. Shaftesbury was seized on July 21, 1681 and again put in the tower. He was tried on trumped-up charges of treason but acquitted by a London grand jury (filled with his supporters) in November.

At this point some of the Country Party leaders began plotting an armed insurrection which, had it come off, would have begun with the assassination of Charles and his brother on their way back to London from the races at Newmarket. The chances of such a rising occurring were not as good as the plotters supposed. Memories of the turmoil of the civil war were still relatively fresh. Eventually Shaftesbury, who was moving from safe house to safe house, gave up and fled to Holland in November 1682. He died there in January 1683. Locke stayed in England until the Rye House Plot (named after the house from which the plotters were to fire upon the King and his brother) was discovered. He took ship for Holland that very week.

While in exile Locke finished *An Essay Concerning Human Understanding* and published a fifty page advanced notice of it in French. (This was to provide the intellectual world on the continent with most of their information about the *Essay* until Pierre Coste's French translation appeared.) He also wrote and published his *Epistola de Tolerentia* in Latin. Recent scholarship suggests that while in Holland Locke was not only finishing *An Essay Concerning Human Understanding* and nursing his health, he was closely associated with the English revolutionaries in exile. The English government was much concerned with this group. They tried to get a number of them, including Locke, extradited to England. Locke's studentship at Oxford was taken away from him. In the meanwhile, the English intelligence service infiltrated the rebel group in Holland and effectively thwarted their efforts -- at least for a while.

While Locke was living in exile in Holland, Charles II died on Feb. 6, 1685 and was succeeded by his brother -- who became James II of England. Soon after this the rebels in Holland sent a force of soldiers under the Duke of Monmouth to England to try to overthrow James II. Because of the excellent work of the Stuart spies, the government knew where the force was going to land before the troops on the ships did. The revolt was crushed, Monmouth captured and executed.(Ashcraft, 1986)

Ultimately, however, the rebels were successful. James II alienated most of his supporters and William of Orange was invited to bring a Dutch force to England. After William's army landed, James II realizing that he could not mount an effective resistance, fled the country to exile in France. This became known as the Glorious Revolution of 1688. It is an watershed in English history. For it marks the point at which the balance of power in the English government passed from the King to the Parliament. Locke returned to England in 1688 on board the royal yacht, accompanying Princess Mary on her voyage to join her husband.

1.3 The End of Locke's Life 1689-1704

After his return from exile, Locke published *An Essay Concerning Human Understanding* and *The Two Treatises of Government*. In addition, Popple's translation of Locke's *A Letter Concerning Toleration* was also published. It is worth noting that the *Two Treatises* and the *Letter Concerning Toleration* were published anonymously. Locke took up residence in the country at Oates in Essex, the home of Sir Francis and Lady Masham (Damaris Cudworth). Locke had met Damaris Cudworth in 1682 and became involved intellectually and romantically with her. She was the daughter of Ralph Cudworth, the Cambridge Platonist, and a philosopher in her own right. After Locke went into exile in Holland in 1683, she married Sir Francis Masham. Locke and Lady Masham remained good friends and intellectual companions to the end of Locke's life. During the remaining years of his life Locke oversaw four more editions of the *Essay* and engaged in controversies over the Essay most notably in a series of published letters with Edward Stillingfleet, Bishop of Worcester. In a similar way, Locke defended the *Letter Concerning Toleration* against a series of attacks. He wrote *The Reasonableness of Christianity* and *Some Thoughts on Education* during this period as well.

Nor was Locke finished with public affairs. In 1696 the Board of Trade was revived. Locke played an important part in its revival and served as the most influential member on it until 1700. The Board of Trade was, in Peter Laslett's phrase "... the body which administered the United States before the American revolution." (Laslett in Yolton 1990 p. 127) The board was, in fact, concerned with a wide range of issues, from the Irish wool trade and the suppression of piracy, to the governance of the colonies and the treatment of the poor in England. During these last eight years of his life, Locke was asthmatic, and he suffered so much from it that he could only bear the smoke of London during the four warmer months of the year. Locke plainly engaged in the activities of the Board out of a strong sense of patriotic duty. After his retirement from the Board of Trade in 1700, Locke remained in retirement at Oates until his death on Sunday 28 October 1704.

2. The Limits of Human Understanding

Locke is often classified as the first of the great English empiricists (ignoring the claims of Bacon and Hobbes). This reputation rests on Locke's greatest work, the monumental *An Essay Concerning Human Understanding.* Locke explains his project in several places. Perhaps the most important of his goals is to determine the limits of human understanding. Locke writes:

> For I thought that the first Step towards satisfying the several Enquiries, the Mind of Man was apt to run into, was, to take a Survey of our own Understandings, examine our own Powers, and see to what Things they were adapted. Till that was done, I suspected that we began at the wrong end, and in vain sought for Satisfaction in a quiet and secure Possession of Truths, that most concern'd us whilst we let loose our Thoughts into the vast Ocean of *Being,*as if all the boundless Extent, were the natural and undoubted Possessions of our Understandings, wherein there was nothing that escaped its Decisions, or that escaped its Comprehension. Thus Men, extending their Enquiries beyond their Capacities, and letting their Thoughts wander into those depths where they can find no sure Footing; 'tis no Wonder, that they raise Questions and multiply Disputes, which never coming to any clear Resolution, are proper to only continue and increase their Doubts, and to confirm them at last in a perfect Skepticism. Wheras were the Capacities of our Understanding well considered, the Extent of our Knowledge once discovered, and the Horizon found, which sets the boundary between the enlightened and the dark Parts of Things; between what is and what is not comprehensible by us, Men would perhaps with less scruple acquiesce in the avow'd Ignorance of the one; and employ their Thoughts and Discourse, with more Advantage and Satisfaction in the other. (I.1.7., p. 47)

Some philosophers before Locke had suggested that it would be good to find the limits of the Understanding, but what Locke does is to carry out this project in detail. In the four books of the *Essay* Locke considers the sources and nature of human knowledge. Book I argues that we have no innate knowledge. (In this he resembles Berkeley and Hume, and differs from Descartes and Leibniz.) So, at birth, the human mind is a sort of blank slate on which experience writes. In Book II Locke claims that ideas are the materials of knowledge and all ideas come from experience. The term ‘idea,’ Locke tells us "...stands for whatsoever is the Object of the Understanding, when a man thinks." (Essay I, 1, 8, p. 47) Experience is of two kinds, sensation and reflection. One of these -- sensation -- tells us about things and processes in the external world. The other -- reflection -- tells us about the operations of our own minds. Reflection is a sort of internal sense that makes us conscious of the mental processes we are engaged in. Some ideas we get only from sensation, some only from reflection and some from both.

Locke has an atomic or perhaps more accurately a corpuscular theory of ideas.[3] There is, that is to say, an analogy between the way atoms or corpuscles combine into complexes to form physical objects and the way ideas combine. Ideas are either simple or complex. We cannot create simple ideas, we can only get them from experience. In this respect the mind is passive. Once the mind has a store of simple ideas, it can combine them into complex ideas of a variety of kinds. In this respect the mind is active. Thus, Locke subscribes to a version of the empiricist axiom that there is nothing in the intellect that was not

previously in the senses -- where the senses are broadened to include reflection. Book III deals with the nature of language, its connections with ideas and its role in knowledge. Book IV, the culmination of the previous reflections, explains the nature and limits of knowledge, probability, and the relation of reason and faith. Let us now consider the *Essay* in some detail.

2.1 Book I

At the beginning of *An Essay Concerning Human Understanding* Locke says that since his purpose is "to enquire into the Original, Certainty and Extant of human knowledge, together with the grounds and degrees of Belief, Opinion and Assent" he is going to begin with ideas -- the materials out of which knowledge is constructed. His first task is to "enquire into the Original of these Ideas...and the ways whereby the Understanding comes to be furnished with them." (I. 1. 3. p. 44) The role of Book I of the *Essay* is to make the case that being innate is not a way in which the understanding is furnished with principles and ideas. Locke treats innateness as an empirical hypothesis and argues that there is no good evidence to support it.

Locke describes innate ideas as "some primary notions...Characters as it were stamped upon the Mind of Man, which the Soul receives in its very first Being; and brings into the world with it." (I. 2. 1. p. 48) In pursuing this enquiry, Locke rejects the claim that there are speculative innate principles (I. Chapter 2), practical innate moral principles (I. Chapter 3) or that we have innate ideas of God, identity or impossibility (I. Chapter 4). Locke rejects arguments from universal assent and attacks dispositional accounts of innate principles. Thus, in considering what would count as evidence from universal assent to such propositions as "What is, is" or "It is impossible for the same thing to be and not to be" he holds that children and idiots should be aware of such truths if they were innate but that they "have not the least apprehension or thought of them." Why should children and idiots be aware of and able to articulate such propositions? Locke says: "It seems to me a near Contradiction to say that there are truths imprinted on the Soul, which it perceives or understands not; imprinting if it signify anything, being nothing else but the making certain Truths to be perceived." (I. 2. 5., p. 49). So, Locke's first point is that if propositions were innate they should be immediately perceived -- by infants and idiots (and indeed everyone else) -- but there is no evidence that they are. Locke then proceeds to attack dispositional accounts that say, roughly, that innate propositions are capable of being perceived under certain circumstances. Until these circumstances come about the propositions remain unperceived in the mind. With the advent of these conditions, the propositions are then perceived. Locke gives the following argument against innate propositions being dispositional:

> For if any one [proposition] may [be in the mind but not be known]; then, by the same Reason, all Propositions that are true, and the Mind is ever capable of assenting to, may be said to be in the Mind, and to be imprinted: since if any one can be said to be in the Mind, which it never yet knew, it must be only because it is capable of knowing it; and so the Mind is of all Truths it ever shall know. (I. 2. 5., p. 50)

The essence of this argument and many of Locke's other arguments against dispositional accounts of

innate propositions is that such dispositional accounts do not provide an adequate criterion for distinguishing innate propositions from other propositions that the mind may come to discover. Thus, even if some criterion is proposed, it will turn out not to do the work it is supposed to do. For example Locke considers the claim that innate propositions are discovered and assented to when people "come to the use of Reason. (I. 2. 6., p. 51) Locke considers two possible meanings of this phrase. One is that we use reason to discover these innate propositions. Here he argues that the criterion is inadequate because it would not distinguish axioms from theorems in mathematics. Presumably the theorems are not innate while the axioms should be. But if both need to be discovered by reason, then there is no distinction between them. Nor will it do to say that one class (the axioms) are assented to as soon as perceived while the others are not. To be assented to as soon as perceived is a mark of certainty, but not of innateness. Locke also objects that truths that need to be discovered by reason could never be thought to be innate. The second possible meaning of "come to the use of reason" is that we discover these ideas at the time we come to use reason, but that we do not use reason to do so. He argues that this claim simply is not true. We know that children acquire such propositions before they acquire the use of reason, while others who are reasonable never acquire them.

When Locke turns from speculative principles to the question of whether there are innate practical moral principles, many of the arguments against innate speculative principles continue to apply, but there are some additional considerations. Practical principles, such as the Golden Rule, are not self-evident in the way such speculative principles as "What is, is" are. Thus, one can clearly and sensibly ask reasons for why one should hold the Golden Rule true or obey it. (I, 3. 4. p. 68) There are substantial differences between people over the content of practical principles. Thus, they are even less likely candidates to be innate propositions or to meet the criterion of universal assent. In the fourth chapter of Book I, Locke raises similar points about the ideas which compose both speculative and practical principles. The point is that if the ideas that are constitutive of the principles are not innate, this gives us even more reason to hold that the principles are not innate. He examines the ideas of identity, impossibility and God to make these points.

John Yolton has persuasively argued (Yolton, 1956) that the view that innate ideas and principles were necessary for the stability of religion, morality and natural law was widespread in England in the seventeenth century, and that in attacking both the naive account of innate ideas, Locke is attacking positions which were widely held and continued to be held after the publication of the *Essay*. Thus, the charge that Locke's account of innate ideas is made of straw, is not a just criticism. Whether the views of more important philosophers, Descartes before Locke or Leibniz after him escape the criticisms of innate ideas that Locke proposes lies beyond the scope of this article.

2.2 Book II

In Book II of the *Essay*, Locke gives his positive account of how we acquire the materials of knowledge. Locke distinguishes a variety of different kinds of ideas in Book II. Locke holds that the mind is a *tabula rasa* or blank sheet until experience in the form of sensation and reflection provide the basic materials -- simple ideas -- out of which most of our more complex knowledge is constructed. While the mind may

be a blank slate in regard to content, it is plain that Locke thinks we are born with a variety of faculties to receive and abilities to manipulate or process the content once we acquire it. Thus, for example, the mind can engage in three different types of action in putting simple ideas together. The first of these kinds of action is to combine them into complex ideas. Complex ideas are of two kinds, ideas of substances and ideas of modes. Substances are independent existences. Beings that count as substances include God, angels, humans, animals, plants and a variety of constructed things. Modes, are dependent existences. These include mathematical and moral ideas, and all the conventional language of religion, politics and culture. The second action which the mind performs is the bringing of two ideas, whether simple or complex, by one another so as to take a view of them at once, without uniting them This gives us our ideas of relations. (II. xii. 1., p. 163) The third act of the mind is the production of our general ideas by abstraction from particulars, leaving out the particular circumstances of time and place, which would limit the application of an idea to a particular individual. In addition to these abilities, there are such faculties as memory which allow for the storing of ideas.

Having set forth the general machinery of how simple and complex ideas of substances, modes, relations and so forth are derived from sensation and reflection Locke also explains how a variety of particular kinds of ideas, such as the ideas of solidity, number, space, time, power, identity, and moral relations arise from sensation and reflection. Several of these are of particular interest. Locke's chapter on power giving rise to a discussion of free will, voluntary action, and so forth, is of considerable interest. Some of these topics will be discussed in separate Encyclopedia entries. I have provided an account of Locke's views on personal identity and the immateriality of the soul in supplementary document:

> [Supplementary Document: The Immateriality of the Soul and Personal Identity]

In what follows, I focus on some central issues in Locke's account of physical objects.

Locke offers an account of physical objects based in the mechanical philosophy and the corpuscular hypothesis. The adherents of the mechanical philosophy held that all material phenomena can be explained by matter in motion and the impact of one body on another. They viewed matter as passive. They rejected the "occult qualities" and "causation at a distance" of the Aristotelian and Scholastic philosophy. The corpuscular hypothesis is that all matter is composed of particles. In the material world, all that exists are particles and the void or empty space in which the particles move. Some corupscularians held that corpuscles could be further divided. Atomists, on the other hand, held that there were indivisible or atomic particles.

Atoms have properties. They are extended, they are solid, they have a particular shape and they are in motion or rest. They combine together to produce the familiar stuff and physical objects, the gold and the wood, the horses and violets, the tables and chairs of our world. These familiar things also have properties. They are extended, solid, have a particular shape and are in motion and at rest. In addition to these properties that they share with the atoms that compose them, they have other properties such as colors, smells, tastes that they get by standing in relation to perceivers. The distinction between these two kinds of properties goes back to the Greek atomists. It is articulated by Galileo and Descartes as well as

Locke's mentor Robert Boyle.

Locke makes this distinction early in Book II of the Essay and using Boyle's terminology calls the two different classes of properties the primary and secondary qualities of an object. This distinction is made by both of the main branches of the mechanical philosophy of the seventeenth and early eighteenth century. Both the Cartesian plenum theorists, who held that the world was full of matter and that there was no void space, and the atomists such as Gassendi, who held that there were atoms and void space in which the atoms move, made the distinction between these two classes of properties. Locke accepted the corpuscular hypothesis as the most likely hypothesis. Thus, in the Chapter on Solidity Locke rejects the Cartesian definition of body as simply extended and argues that bodies are both extended and impenetrable or solid. The primary qualities of an object are properties which the object possesses independent of us -- such as occupying space, being either in motion or at rest, having texture. The secondary qualities are powers in bodies to produce in us ideas like color, taste, smell and so on that are caused by the interaction of our particular perceptual apparatus with these powers of the primary qualities of the object. Our ideas of primary qualities resemble the qualities in the object, while our ideas of secondary qualities do not resemble the powers that cause them. Locke also distinguishes tertiary properties that are the powers that one substance has to effect another, e.g. the power of a fire to melt a piece of wax.

There has been considerable scholarly debate concerning the details of Locke's account of the distinction. Among the issues are which qualities Locke assigns to each of the two categories. Locke gives several lists. Another issue is what the criterion is for putting a quality in one list rather than another. Does Locke hold that all the ideas of secondary qualities come to us by one sense while the ideas of primary qualities come to us through two or is Locke not making the distinction in this way? Another issue is whether on Locke's view primary qualities are perceptible at all. And while Locke claims our ideas of primary qualities resemble the primary qualities in objects, while the ideas of secondary qualities do not resemble their causes in the object, what does 'resemble' mean in this context? Related to this issue is how we are supposed to know about particles that we cannot sense. Maurice Mandlebaum called this process 'transdiction.' It seems clear that Locke holds that there are certain analogies between the middle sized macroscopic objects we encounter in the world, e.g. porphyry and manna for example, and the particles that compose these things. These analogies allow us to say certain things about the nature of particles and primary qualities, but may not get us very far in grasping the necessary connections between qualities in nature. Yet another issue is whether Locke sees the distinction as reductionistic -- that is whether only the primary qualities are real.

Locke probably holds some version of the representational theory of perception, though some scholars dispute even this. On such a theory what the mind immediately perceives are ideas, and the ideas are caused by and represent the objects which cause them. Thus perception is a triadic relation, rather than simply being a dyadic relation between an object and a perceiver. Such a dyadic relational theory is often called naive realism because it suggests that the perceiver is directly perceiving the object, and naive because this view is open to a variety of serious objections. Some versions of the representational theory are open to serious objections as well. If, for example, one makes ideas into things, then one can imagine that because one sees ideas, the ideas actually block one from seeing things in the external world. The

idea would be like a picture or painting. The picture would copy the original object in the external world, but because our immediate object of perception is the picture we would be prevented from seeing the original just as standing in front of a painting on an easel might prevent us from seeing the person being painted. Thus, this is sometimes called the picture/original theory of perception. Alternatively, Jonathan Bennett called it "the veil of perception". to emphasize that ’seeing’ the ideas prevents us from seeing the external world. One philosopher who arguably held such a view was Nicholas Malebranche, a follower of Descartes. Antoine Arnauld, by contrast, while believing in the representative character of ideas, is a direct realist about perception. Arnauld engaged in a lengthy controversy with Malebranche, and criticized Malebranche's account of ideas. Locke follows Arnauld in his criticism of Malebranche on this point. Yet Berkeley attributed the veil of perception interpretation of the representational theory of perception to Locke as have many later commentators including Bennett. A.D. Woozley puts the difficulty of doing this succinctly: "...it is scarcely credible both that Locke should be able to see and state so clearly the fundamental objection to the picture-original theory of sense perception, and that he should have held the same theory himself." Just what Locke's account of perception involves, is still a matter of scholarly debate.

Another issue that has been a matter of controversy since the first publication of the *Essay* is what Locke means by the term ‘substance’. The primary/secondary quality distinction gets us a certain ways in understanding physical objects, but Locke is puzzled about what underlies or supports the primary qualities themselves. He is also puzzled about what material and immaterial substances might have in common that would lead us to apply the same word to both. These kinds of reflections led him to the relative and obscure idea of substance in general. This is that "I know not what" which is the support of qualities which cannot subsist by themselves. We experience properties appearing in regular clumps, but we must infer that there is something that supports or perhaps ‘holds together’ those qualities. For we have no experience of that supporting substance. I think it is clear that Locke sees no alternative to the claim that there are substances supporting qualities. He does not, for example, have a theory of tropes (tropes are properties that can exist independently of substances) which he might use to dispense with the notion of substance. (In fact, he may be rejecting something like a theory of tropes when he rejects the Aristotelian doctrine of real qualities and insists on the need for substances.) He is thus not at all a skeptic about ‘substance’ in the way that Hume is. But, it is also quite clear that he is regularly insistent about the limitations of our ideas of substances. Bishop Stillingfleet accused Locke of putting substance out of the reasonable part of the world. But Locke is not doing that.

Since Berkeley, Locke's doctrine of the substratum or substance in general has been attacked as incoherent. It seems to imply that we have a particular without any properties, and this seems like a notion that is inconsistent with empiricism. In order to avoid this problem, Michael Ayers has proposed that we must understand the notions of ‘substratum’ and ‘substance in general’ in terms of Locke's doctrine of real essences developed in Book III of the Essay rather than as a separate problem from that of knowing real essences. The real essence of a material thing is its atomic constitution. This atomic constitution is the causal basis of all the observable properties of the thing. Were the real essence known, all the observable properties could be deduced from it. Locke claims that the real essences of material things are quite unknown to us. Locke's concept of substance in general is also a ‘something I know not what.’ Thus, on Ayers' interpretation ‘substance in general’ means something like ’whatever it is that

supports qualities' while the real essence means 'this particular atomic constitution that explains this set of observable qualities'. Thus, Ayers wants to treat the unknown substratum as picking out the same thing as the real essence -- thus eliminating the need for particulars without properties. This proposed way of interpreting Locke has been criticized by scholars both because of a lack of textural support, and on the stronger grounds that it conflicts with some things that Locke does say. (See Jolley 1999 pp. 71-3) As we have reached one of the important concepts in Book III, let us turn to that Book and Locke's discussion of language.

2.3 Book III

Locke devotes Book III of *An Essay Concerning Human Understanding* to language. This is a strong indication that Locke thinks issues about language were of considerable importance in attaining knowledge. At the beginning of the Book he notes the importance of abstract general ideas to knowledge. These serve as sorts under which we rank all the vast multitude of particular existences. Thus, abstract ideas and classification are of central importance in Locke's discussion of language.

There is a clear connection between Book II and III in that Locke claims that words stand for ideas. In his discussion of language Locke distinguishes words according to the categories of ideas established in Book II of the Essay. So there are ideas of substances, simple modes, mixed modes, relations and so on. It is in this context that Locke makes the distinction between real and nominal essences noted above. Perhaps because of his focus on the role that kind terms play in classification, Locke pays vastly more attention to nouns than to verbs. Locke recognizes that not all words relate to ideas. There are the many particles, words that "...signify the connexion that the Mind gives to Ideas, or Propositions, one with another. (II., 7. 1. p. 471) Still, it is the relation of words and ideas that gets most of Locke's attention in Book III.

Norman Kretzmann calls the claim that *'words in their primary or immediate signification signify nothing but the ideas in the mind of him that uses them'* Locke's main semantic thesis. (See Norman Kretzmann, ""The Main Thesis of Locke's Semantic Theory" in Tipton, 1977. pp. 123-140) This thesis has often been criticized as a classic blunder in semantic theory. Thus Mill, for example, wrote, "When I say, "the sun is the cause of the day," I do not mean that my idea of the sun causes or excites in me the idea of day." This criticism of Locke's account of language parallels the "veil of perception" critique of his account of perception and suggests that Locke is not distinguishing the meaning of a word from its reference. Kretzmann, however, argues persuasively that Locke distinguishes between meaning and reference and that ideas provide the meaning but not the reference of words. Thus, the line of criticism represented by the quotation from Mill is ill founded.

In addition to the kinds of ideas noted above, there are also particular and abstract ideas. Particular ideas have in them the ideas of particular places and times which limit the application of the idea to a single individual, while abstract general ideas leave out the ideas of particular times and places in order to allow the idea to apply to other similar qualities or things. There has been considerable philosophical and scholarly debate about the nature of the process of abstraction and Locke's account of it. Berkeley argued

that the process as Locke conceives it is incoherent. In part this is because Berkeley is an imagist -- that is he believes that all ideas are images. If one is an imagist it becomes impossible to imagine what idea could include both the ideas of a right and equilateral triangle. Michael Ayers has recently argued that Locke too was an imagist. This would make Berkeley's criticism of Locke very much to the point. Ayers' claim, however, has been disputed. The process of abstraction is of considerable importance to human knowledge. Locke thinks most words we use are general. (III, I. 1. p., 409) Clearly, it is only general or sortal ideas that can serve in a classificatory scheme.

In his discussion of names of substances and in the contrast between names of substances and names of modes, a number of interesting features of Locke's views about language and knowledge emerge. Physical substances are atoms and things made up of atoms. But we have no experience of the atomic structure of horses and tables. We know horses and tables mainly by secondary qualities such as color, taste and smell and so on and primary qualities such as shape and extension. So, since the real essence (the atomic constitution) of a horse is unknown to us, our word ‘horse’ cannot get its meaning from that real essence. What the general word signifies is the complex of ideas we have decided are parts of the idea of that sort of thing. These ideas we get from experience. Locke calls such a general idea that picks out a sort, the nominal essence of that sort.

One of the central issues in Book III has to do with classification. On what basis do we divide things into kinds and organize those kinds into a system of species and genera? In the Aristotelian and Scholastic tradition that Locke rejects, necessary properties are those that an individual must have in order to exist and continue to exist. These contrast with accidental properties. Accidental properties are those that an individual can gain and lose and yet continue in existence. If a set of necessary properties is shared by a number of individuals, that set of properties constitutes the essence of a natural kind. The aim of Aristotelian science is to discover the essences of natural kinds. Kinds can then be organized hierarchically into a classificatory system of species and genera. This classification of the world by natural kinds will be unique and privileged because it alone corresponds to the structure of the world. This doctrine of essences and kinds is often called Aristotelian essentialism. Locke rejects a variety of aspects of this doctrine. He rejects the notion that an individual has an essence apart from being treated as belonging to a kind. He also rejects the claim that there is a single classification of things in nature that the natural philosopher should seek to discover. He holds that there are many possible ways to classify the world each of which might be particularly useful depending on one's purposes.

Locke's pragmatic account of language and the distinction between nominal and real essences constitute an anti-essentialist alternative to this Aristotelian essentialism and its correlative account of the classification of natural kinds. He claims that there are no fixed boundaries in nature to be discovered -- that is there are no clear demarcation points between species. There are always borderline cases. There is scholarly debate over whether Locke's view is that this lack of fixed boundaries is true on both the level of appearances and nominal essences, and atomic constitutions and real essences, or on the level of nominal essences alone. The first view is that Locke holds that there are no natural kinds on either the level of appearance or atomic reality while the second view holds that Locke thinks there are real natural kinds on the atomic level, it is simply that we cannot get at them or know what they are. On either of these interpretations, the real essence cannot provide the meaning to names of substances.

By contrast, the ideas that we use to make up our nominal essences come to us from experience. Locke claims that the mind is active in making our ideas of sorts and that there are so many properties to choose among that it is possible for different people to make quite different ideas of the essence of a certain substance. This has given some commentators the impression that the making of sorts is utterly arbitrary and conventional for Locke and that there is no basis for criticizing a particular nominal essence. Sometimes Locke says things that might suggest this. But he also points out that the making of nominal essences is constrained both by usage (where words standing for ideas that are already in use) and by the fact that substance words are supposed to copy the properties of the substances they refer to.

Let us begin with the usage of words first. It is important that in a community of language users that words be used with the same meaning. If this condition is met it facilitates the chief end of language which is communication. If one fails to use words with the meaning that most people attach to them, one will fail to communicate effectively with others. Thus one would defeat the main purpose of language. It should also be noted that traditions of usage for Locke can be modified. Otherwise we would not be able to improve our knowledge and understanding by getting more clear and determinate ideas.

In the making of the names of substances there is a period of discovery as the abstract general idea is put together (e.g. the discovery of violets or gold) and then the naming of that idea and then its introduction into language. Language itself is viewed as an instrument for carrying out the mainly prosaic purposes and practices of every day life. Ordinary people are the chief makers of language.

> Vulgar Notions suit vulgar Discourses; and both though confused enough, yet serve pretty well for the Market and the Wake. Merchants and Lovers, Cooks and Taylors, have Words wherewith to dispatch their ordinary affairs; and so, I think, might Philosophers and Disputants too, if they had a mind to understand and to be clearly understood. (III. Xi. 10. p. 514)

These ordinary people use a few apparent qualities, mainly ideas of secondary qualities to make ideas and words that will serve their purposes.

Scientists come along later to try to determine if the connections between properties which the ordinary folk have put together in a particular idea in fact holds in nature. Scientists are seeking to find the necessary connections between properties. Still, even scientists, in Locke's view, are restricted to using observable (and mainly secondary) qualities to categorize things in nature. Sometimes, the scientists may find that the ordinary folk have erred, as when they called whales ‘fish’. A whale is not a fish, as it turns out, but a mammal. There is a characteristic group of qualities which fish have which whales do not have. There is a characteristic group of qualities which mammals have which whales also have. To classify a whale as a fish therefore is a mistake. Similarly, we might make an idea of gold that only included being a soft metal and gold color. If so, we would be unable to distinguish between gold and fool's gold. Thus, since it is the mind that makes complex ideas (they are ‘the workmanship of the understanding’), one is free to put together any combination of ideas one wishes and call it what one will.

But the product of such work is open to criticism, either on the grounds that it does not conform to already current usage, or that it inadequately represents the archetypes that it is supposed to copy in the world. We engage in such criticism in order to improve human understanding of the material world and thus the human condition.

The distinction between modes and substances is surely one of the most important in Locke's philosophy. In contrast with substances modes are dependent existences -- they can be thought of as the ordering of substances. These are technical terms for Locke, so we should see how they are defined. Locke writes: "First, *Modes* I call such complex *Ideas,* which however compounded, contain not in themselves the supposition of subsisting by themselves; such are the words signified by the Words *Triangle, Gratitude, Murther, etc."* (II. xii.4, p. 165) Locke goes on to distinguish between simple and mixed modes. He writes:

> Of these *Modes,* there are two sorts, which deserve distinct consideration. First, there are some that are only variations, or different combinations of the same simple *Idea,* without the mixture of any other, as a dozen or score; which are nothing but the *ideas* of so many distinct unities being added together, and these I call as being contained within the bounds of one simple *Idea.* Secondly, There are others, compounded of *Ideas* of several kinds, put together to make one complex one; v.g. *Beauty,* consisting of a certain combination of Colour and Figure, causing Delight to the Beholder; *Theft,* which being the concealed change of the Possession of any thing, without the consent of the Proprietor, contains, as is visible, a combination of several *Ideas* of several kinds; and these I call *Mixed Modes.* (II, xii. 5., p. 165)

When we make ideas of modes, the mind is again active, but the archetype is in our mind. The question becomes whether things in the world fit our ideas, and not whether our ideas correspond to the nature of things in the world. Our ideas are adequate. Thus we define ‘bachelor’ as an unmarried, adult, male human being. If we find that someone does not fit this definition, this does not reflect badly on our definition, it simply means that that individual does not belong to the class of bachelors. Modes give us the ideas of mathematics, of morality, of religion and politics and indeed of human conventions in general. Since these modal ideas are not only made by us but serve as standards that things in the world either fit or do not fit and thus belong or do not belong to that sort, ideas of modes are clear and distinct, adequate and complete. Thus in modes, we get the real and nominal essences combined. One can give precise definitions of mathematical terms (that is, give necessary and sufficient conditions) and one can give deductive demonstrations of mathematical truths. Locke sometimes says that morality too is capable of deductive demonstration. Though pressed by his friend William Molyneux to produce such a demonstrative morality, Locke never did so. The terms of political discourse have some of the same features for Locke. When Locke defines the states of nature, slavery and war in the *Second Treatise of Government,* for example, we are presumably getting precise modal definitions from which one can deduce consequences. It is possible, however, that with politics we are getting a study which requires both experience as well as the deductive modal aspect.

The extant of the influence that Locke’ account of language has had over the centuries is a matter of

scholarly debate. Norman Kretzmann holds that Locke's views, while not original had a powerful influence on the Enlightenment view of the connection of words and ideas. Noam Chomsky in *Cartesian Linguistics* traces the important ideas in linguistics back to Descartes and the school at Port Royal rather than Locke. This is largely a matter of the importance of the innate in Chomsky's thought. Hans Aarsleff, on the other hand, believes that Locke stands at the beginning of the developments that produced contemporary linguistics and Aarsleff argues that Chomsky's account is more polemical than historical.

2.4 Book IV

In the fourth book of *An Essay Concerning Human Understanding* Locke tells us what knowledge is and what humans can know and what they cannot (not simply what they do and do not happen to know). Locke defines knowledge as "the perception of the connexion and agreement or disagreement and repugnancy of any of our Ideas" (IV. I. 1. p. 525). This definition of knowledge contrasts with the Cartesian definition of knowledge as any ideas that are clear and distinct. Locke's account of knowledge allows him to say that we can know substances in spite of the fact that our ideas of them always include the obscure and relative idea of substance in general. Still, Locke's definition of knowledge raises in this domain a problem analogous to those we have seen with perception and language. If knowledge is the perception of the agreement or disagreement of any of our Ideas" -- are we not trapped in the circle of our own ideas? what about knowing the real existence of things? Locke is plainly aware of this problem, but how adequate his solution to it is is more doubtful.

What then can we know and with what degree of certainty? We can know that God exists with the second highest degree of assurance, that of demonstration. We also know that we exist with the highest degree of certainty. The truths of morality and mathematics we can know with certainty as well, because these are modal ideas whose adequacy is guaranteed by the fact that we make such ideas as ideal models which other things must fit, rather than trying to copy some external archetype which we can only grasp inadequately. On the other hand, our efforts to grasp the nature of external objects is limited largely to the connection between their apparent qualities. The real essence of elephants and gold is hidden from us: though in general we suppose them to be some distinct combination of atoms which cause the grouping of apparent qualities which leads us to see elephants and violets, gold and lead as distinct kinds. Our knowledge of material things is probabilistic and thus opinion rather than knowledge. Thus our "knowledge" of external objects is inferior to our knowledge of mathematics and morality, of ourselves, and of God. While Locke holds that we only have knowledge of a limited number of things, he thinks we can judge the truth or falsity of many propositions in addition to those we can legitimately claim to know. This brings us to a discussion of probability.

2.5 Knowledge and Probability

Knowledge involves the seeing of the agreement or disagreement of our ideas. What then is probability and how does it relate to knowledge? Locke writes:

> The Understanding Faculties being given to Man, not barely for Speculation, but also for

> the Conduct of his Life, Man would be at a great loss, if he had nothing to direct him, but what has the Certainty of true *Knowledge*... Therefore, as God has set some Things in broad day-light; as he has given us some certain Knowledge...So in the greater part of our Concernment, he has afforded us only the twilight, as I may say so, of Probability, suitable, I presume, to that State of Mediocrity and Probationership, he has been pleased to place us in here, wherein to check our over-confidence and presumption, we might by every day's Experience be made sensible of our short sightedness and liableness to Error...(IV, xiv, 1-2., p. 652)

So, apart from the few important things that we can know for certain, e.g. the existence of ourselves and God, the nature of mathematics and morality broadly construed, for the most part we must lead our lives without knowledge. What then is probability? Locke writes:

> As Demonstration is the shewing of the agreement or disagreement of two Ideas, by the intervention of one or more Proofs, which have a constant, immutable, and visible connexion one with another: so Probability is nothing but the appearance of such an Agreement or Disagreement, by the intervention of Proofs, whose connection is not constant and immutable, or at least is not perceived to be so, but is or appears, for the most part to be so, and is enough to induce the Mind to judge the Proposition to be true, or false, rather than the contrary. (IV., xv, 1., p. 654)

Probable reasoning, on this account, is an argument, similar in certain ways to the demonstrative reasoning that produces knowledge but different also in certain crucial respects. It is an argument that provides evidence that leads the mind to judge a proposition true or false but without a guarantee that the judgment is correct. This kind of probable judgment comes in degrees, ranging from near demonstrations and certainty to unlikeliness and improbability to near the vicinity of impossibility. It is correlated with degrees of assent ranging from full assurance down to conjecture, doubt and distrust.

The new science of mathematical probability had come into being on the continent just around the time that Locke was writing the *Essay*. His account of probability, however, shows little or no awareness of mathematical probability. Rather it reflects an older tradition that treated testimony as probable reasoning. Given that Locke's aim, above all, is to discuss what degree of assent we should give to various religious propositions, the older conception of probability very likely serves his purposes best. Thus, when Locke comes to describe the grounds for probability he cites the conformity of the proposition to our knowledge, observation and experience, and the testimony of others who are reporting their observation and experience. Concerning the latter we must consider the number of witnesses, their integrity, their skill in observation, counter testimony and so on. In judging rationally how much to assent to a probable proposition, these are the relevant considerations that the mind should review. We should, Locke also suggests, be tolerant of differing opinions as we have more reason to retain the opinions we have than to give them up to strangers or adversaries who may well have some interest in our doing so.

Locke distinguishes two sorts of probable propositions. The first of these have to do with particular existences or matters of fact, and the second that are beyond the testimony of the senses. Matters of fact are open to observation and experience, and so all of the tests noted above for determining rational assent to propositions about them are available to us. Things are quite otherwise with matters that are beyond the testimony of the senses. These include the knowledge of finite immaterial spirits such as angels or things such as atoms that are too small to be sensed, or the plants, animals or inhabitants of other planets that are beyond our range of sensation because of their distance from us. Concerning this latter category, Locke says we must depend on analogy as the only help for our reasoning. He writes: "Thus the observing that the bare rubbing of two bodies violently one upon the other, produce heat, and very often fire it self, we have reason to think, that what we call Heat and Fire consist of the violent agitation of the imperceptible minute parts of the burning matter..." (IV. xvi. 12. Pp 665-6) We reason about angels by considering the Great Chain of Being; figuring that while we have no experience of angels, the ranks of species above us is likely as numerous as that below of which we do have experience. This reasoning is, however, only probable.

2.6 Reason, Faith and Enthusiasm

The relative merits of the senses, reason and faith for attaining truth and the guidance of life were a significant issue during this period. As noted above James Tyrrell recalled that the original impetus for the writing of *An Essay Concerning Human Understanding* was a discussion about the principles of morality and revealed religion. In Book IV Chapters XVII, XVIII and XIX Locke deals with the nature of reason, the relation of reason to faith and the nature of enthusiasm. Locke remarks that all sects make use of reason as far as they can. It is only when this fails them that they have recourse to faith and claim that what is revealed is above reason. But he adds: "And I do not see how they can argue with anyone or even convince a gainsayer who uses the same plea, without setting down strict boundaries between faith and reason." (IV. xviii. 2. p. 689) Locke then defines reason as "the discovery of the certainty or probability of such propositions or truths, which the mind arrives at by deduction made from such ideas, as it has got by the use of its natural faculties; viz, by the use of sensation or reflection." (IV. xviii. ii. p. 689) Faith, on the other hand, is assent to any proposition "...upon the credit of the proposer, as coming from God, in some extraordinary way of communication." That is we have faith in what is disclosed by revelation and which cannot be discovered by reason. Locke also distinguishes between the *original revelation* by God to some person, and *traditional revelation* which is the original revelation "...delivered over to others in Words, and the ordinary ways of our conveying our Conceptions one to another. (IV. xviii, 3 p. 690)

Locke makes the point that some things could be discovered both by reason and by revelation -- God could reveal the propositions of Euclid's geometry, or they could be discovered by reason. In such cases there would be little use for faith. Traditional revelation can never produce as much certainty as the contemplation of the agreement or disagreement of our own ideas. Similarly revelations about matters of fact do not produce as much certainty as having the experience one self. Revelation, then cannot contradict what we know to be true. If it could, it would undermine the trustworthiness of all of our faculties. This would be a disastrous result. Where revelation comes into its own is where reason cannot

reach. Where we have few or no ideas for reason to contradict or confirm, this is the proper matters for faith. "...that Part of the Angels rebelled against GOD, and thereby lost their first happy state: and that the dead shall rise, and live again: These and the like, being Beyond the Discovery of Reason, are purely matters of Faith; with which Reason has nothing to do." (IV. xviii. 8. p. 694) Still, reason does have a crucial role to play in respect to revelation. Locke writes:

> Because the Mind, not being certain of the Truth of that it evidently does not know, but only yielding to the Probability that appears to it, is bound to give up its assent to such Testimony, which, it is satisfied, comes from one who cannot err, and will not deceive. But yet, it still belongs to Reason, to judge of the truth of its being a Revelation, and of the significance of the Words, wherein it is delivered. (IV. 18. 8., p. 694)

So, in respect to the crucial question of how we are to know whether a revelation is genuine, we are supposed to use reason and the canons of probability to judge. Locke claims that if the boundaries between faith and reason are not clearly marked, then there will be no place for reason in religion and one then gets all the "extravagant Opinions and Ceremonies, that are to be found in the religions of the world..." (IV. 18. 11. p. 696)

Should one accept revelation without using reason to judge whether it is genuine revelation or not, one gets what Locke calls a third principle of assent besides reason and revelation, namely enthusiasm. Enthusiasm is a vain or unfounded confidence in divine favor or communication. It implies that there is no need to use reason to judge whether such favor or communication is genuine or not. Clearly when such communications are not genuine they are 'the ungrounded Fancies of a Man's own Brain.'(IV. xix. 2. p. 698) This kind of enthusiasm was characteristic of Protestant extremists going back to the era of the Civil War. Locke was not alone in rejecting enthusiasm, but he rejects it in the strongest terms. Enthusiasm violates the fundamental principle by which the understanding operates -- that assent be proportioned to the evidence. To abandon that fundamental principle would be catastrophic. This is a point that Locke also makes in *The Conduct of the Understanding*,and *The Reasonableness of Christianity*. Locke wants each of us to use our understanding to search after truth. Of enthusiasts, those who would abandon reason and claim to know on the basis of faith alone, Locke writes: "...he that takes away Reason to make way for Revelation, puts out the Light of both, and does much what the same, as if he would perswade a Man to put out his eyes, the better to receive the remote Light of an invisible Star by a Telescope." (IV. xix. 4. p. 698) Rather than engage in the tedious labor required to reason correctly, enthusiasts persuade themselves that they are possessed of immediate revelation, without having to use reason to judge of the genuineness of their revelation. This leads to "odd Opinions and extravagant actions" that are characteristic of enthusiasm and which should warn that this is a wrong principle. Thus, Locke strongly rejects any attempt to make inward persuasion not judged by reason a legitimate principle.

I turn now to a consideration of Locke's political works.

3. The *Two Treatises Of Government*

The introduction of the work was written latter than the main text, and gave people the impression that the book was written in 1688 to justify the Glorious Revolution. We now know that the *Two Treatises of Government* were written during the Exclusion crisis and were probably intended to justify the general armed rising which the Country Party leaders were planning. It was a truly revolutionary work. Supposing that the *Two Treatises* may have been intended to explain and defend the revolutionary plot against Charles II and his brother, how does it do this?

The First Treatise of Government is a polemical work aimed at refuting the patriarchal version of the Divine Right of Kings doctrine put forth by Sir Robert Filmer. Locke singles out Filmer's contention that men are not "naturally free" as the key issue, for that is the "ground" or premise on which Filmer erects his argument for the claim that all "legitimate" government is "absolute monarchy." -- kings being descended from the first man, Adam. Early in the First Treatise Locke denies that either scripture or reason supports Filmer's premise or arguments. In what follows, Locke minutely examines key Biblical passages.

The Second Treatise of Government provides Locke's positive theory of government - he explicitly says that he must do this "lest men fall into the dangerous belief that all government in the world is merely the product of force and violence." Locke's account involves several devices which were common in seventeenth and eighteenth century political philosophy -- natural rights theory and the social contract. Natural rights are those rights which we are supposed to have as human beings before ever government comes into being. We might suppose, that like other animals, we have a natural right to struggle for our survival. Locke will argue that we have a right to the means to survive. When Locke comes to explain how government comes into being, he uses the idea that people agree that their condition in the state of nature is unsatisfactory, and so agree to transfer some of their rights to a central government, while retaining others. This is the theory of the social contract. There are many versions of natural rights theory and the social contract in seventeenth and eighteenth century European political philosophy, some conservative and some radical. Locke's version belongs on the radical side of the spectrum. These radical natural right theories influenced the ideologies of the American and French revolutions.

3.1 *The Second Treatise of Government*

Here is the subject matter of the various chapters of the *Second Treatise:*

- Chapter 1 Book I: the definition of Political power
- Chapter II-VII: the bases of government, states of nature, war, slavery, the nature of property
- Chapters VIII-XIV: the nature of political power and legitimate civil government
- Chapter XV: recapitulates the fundamental distinctions between paternal. political and despotic power.
- Chapter XVI-XVIII: elaborates the nature of illegitimate civil government. It specifies three forms of such illegitimacy: 1. an unjust foreign conquest, 2. internal usurpation of political rule and 3. tyrannical extension of power by those who were originally legitimately in power.

- Chapter XIX: gives the conditions under which legitimate revolution may occur.

Figuring out what the proper or legitimate role of civil government is would be a difficult task indeed if one were to examine the vast complexity of existing civil governments. How should one proceed? One strategy is to consider what life is like in the absence of civil government. Presumably this is a simpler state, one which may be easier to understand. Then one might see what role civil government ought to play. This is the strategy which Locke pursues, following Hobbes and others. So, in the first chapter of the *Second Treatise* Locke defines political power.

> *Political power*, then, I take to be a *right* of making laws with penalties of death, and consequently all less penalties, for the regulating and preserving of property, and of employing the force of the community, in the execution of such laws, and in the defence of the common-wealth from foreign injury; and all this only for the public good

In the second chapter of *The Second Treatise* Locke describes the state in which there is no government with real political power. This is the state of nature. It is sometimes assumed that the state of nature is a state in which there is no government at all. This is only partially true. It is possible to have in the state of nature either no government, illegitimate government, or legitimate government with less than full political power.

If we consider the state of nature before there was government, it is a state of political equality in which there is no natural superior or inferior. From this equality flows the obligation to mutual love and the duties that people owe one another, and the great maxims of justice and charity. Was there ever such a state? There has been considerable debate about this. Still, it is plain that both Hobbes and Locke would answer this question affirmatively. Whenever people have not agreed to establish a common political authority, they remain in the state of nature. It's like saying that people are in the state of being naturally single until they are married. Locke clearly thinks one can find the state of nature in his time at least in the inland vacant parts of America and in the relations between different peoples. Perhaps the historical development of states also went though the stages of a state of nature. An alternative possibility is that the state of nature is not a real historical state, but rather a theoretical construct, intended to help determine the proper function of government. If one rejects the historicity of states of nature, one may still find them a useful analytical device. For Locke, it is very likely both.

3.2 Human Nature and God's Purposes

According to Locke, God created man and we are, in effect, God's property. The chief end set us by our creator as a species and as individuals is survival. A wise and omnipotent God, having made people and sent them into this world:

> ...by his order and about his business, they are his property whose workmanship they are, made to last during his, not one another's pleasure: and being furnished with like faculties, sharing all in one community of nature, there cannot be supposed any subordination among

> us, that may authorize us to destroy one another, as if we were made for one another's uses, as the inferior ranks of creatures are for our's.

It follows immediately that "he has no liberty to destroy himself, or so much as any creature in his possession, yet when some nobler use than its bare possession calls for it." (II. ii. 5) So, murder and suicide violate the divine purpose.

If one takes survival as the end, then we may ask what are the means necessary to that end. On Locke's account, these turn out to be life, liberty, health and property. Since the end is set by God, on Locke's view we have a right to the means to that end. So we have rights to life, liberty, health and property. These are natural rights, that is they are rights that we have in a state of nature before the introduction of civil government, and all people have these rights equally.

If God's purpose for me on earth is my survival and that of my species, and the means to that survival are my life, health, liberty and property -- then clearly I don't want anyone to violate my rights to these things. Equally, considering other people, who are my natural equals, I should conclude that I should not violate their rights to life, liberty, health and property. This is the law of nature. It is the Golden Rule, interpreted in terms of natural rights. Thus Locke writes: "The state of nature has a law of nature to govern it, which obliges everyone: and reason which is that law, teaches all mankind who will but consult it, that being all equal and independent, no one ought to harm another in his life, health, liberty or possessions..." (II, 6) Locke tells us that the law of nature is revealed by reason. Locke makes the point about the law that it commands what is best for us. If it did not, he says, the law would vanish for it would not be obeyed. It is in this sense, I think, that Locke means that reason reveals the law. If you reflect on what is best for yourself and others, given the goal of survival and our natural equality, you will come to this conclusion.

Locke does not intend his account of the state of nature as a sort of utopia. Rather it serves as an analytical device that explains why it becomes necessary to introduce civil government and what the legitimate function of civil government is. Thus, as Locke conceives it, there are problems with life in the state of nature. The law of nature, like civil laws can be violated. There are no police, prosecutors or judges in the state of nature as these are all representatives of a government with full political power. The victims, then, must enforce the law of nature in the state of nature. In addition to our other rights in the state of nature, we have the rights to enforce the law and to judge on our own behalf. We may, Locke tells us, help one another. We may intervene in cases where our own interests are not directly under threat to help enforce the law of nature. Still, the person who is most likely to enforce the law under these circumstances is the person who has been wronged. The basic principle of justice is that the punishment should be proportionate to the crime. But when the victims are judging the seriousness of the crime, they are more likely to judge it of greater severity than might an impartial judge. As a result, there will be regular miscarriages of justice. This is perhaps the most important problem with the state of nature.

In Chapters 3 and 4, Locke defines the states of war and slavery. The state of war is a state in which someone has a sedate and settled intention of violating someone's right to life. Such a person puts

themselves into a state of war with the person whose life they intend to take. In such a war the person who intends to violate someone's right to life is an unjust aggressor. This is not the normal relationship between people enjoined by the law of nature in the state of nature. Locke is distancing himself from Hobbes who had made the state of nature and the state of war equivalent terms. For Locke, the state of nature is ordinarily one in which we follow the Golden Rule interpreted in terms of natural rights, and thus love our fellow human creatures. The state of war only comes about when someone proposes to violate someone else's rights. Thus, on Locke's theory of war, there will always be an innocent victim on on side and an unjust aggressor on the other.

Slavery is the state of being in the absolute or arbitrary power of another. On Locke's definition of slavery there is only one rather remarkable way to become a legitimate slave. In order to do so one must be an unjust aggressor defeated in war. The just victor then has the option to either kill the aggressor or enslave them. Locke tells us that the state of slavery is the continuation of the state of war between a lawful conqueror and a captive, in which the conqueror delays to take the life of the captive, and instead makes use of him. This is a continued war because if conqueror and captive make some compact for obedience on the one side and limited power on the other, the state of slavery ceases. The reason that slavery ceases with the compact is that "no man, can, by agreement pass over to another that which he hath not in himself, a power over his own life." (II. 4, 24) Legitimate slavery is an important concept in Locke's political philosophy largely because it tells us what the legitimate extant of despotic power is and defines and illuminates by contrast the nature of illegitimate slavery. Illegitimate slavery is that state in which someone possesses absolute or despotic power over someone else without just cause. Locke holds that it is this illegitimate state of slavery which absolute monarchs wish to impose upon their subjects. It is very likely for this reason that legitimate slavery is so narrowly defined.

There have been a steady stream of articles over the last forty years arguing that given Locke's involvement with trade and colonial government, the theory of slavery in the *Second Treatise* was intended to justify the institutions and practices of Afro-American slavery. This seems quite unlikely. Had he intended to do so, Locke would have done much better with a vastly more inclusive definition of legitimate slavery than the one he gives. It is sometimes suggested that Locke's account of "just war" is so vague that it could easily be twisted to justify the institutions and practices of Afro-American slavery. This, however, is also not the case. In the Chapter "Of Conquest" Locke explicitly lists the limits of the legitimate power of conquerors. These limits on who can become a legitimate slave and what the powers of a just conqueror are ensure that this theory of conquest and slavery would condemn the institutions and practices of Afro-American slavery in the 17th, 18th and 19th centuries.

"Of Property" is one of the most famous, influential and important chapters in the *Second Treatise of Government.* Indeed, some of the most controversial issues about the *Second Treatise* come from varying interpretations of it. In this chapter Locke, in effect, describes the evolution of the state of nature to the point where it becomes expedient for those in it to found a civil government. So, it is not only an account of the nature and origin of private property, but leads up to the explanation of why civil government replaces the state of nature.

In discussing the origin of private property Locke begins by noting that God gave the earth to all men in

common. Thus there is a question about how private property comes to be. Locke finds it a serious difficulty. He points out, however, that we are supposed to make use of the earth "for the best advantage of life and convenience." (II. 5, 25) What then is the means to appropriate property from the common store? Locke argues that private property does not come about by universal consent. If one had to go about and ask everyone if one could eat these berries, one would starve to death before getting everyone's agreement. Locke holds that we have a property in our own person. And the labor of our body and the work of our hands properly belong to us. So, when one picks up acorns or berries, they thereby belong to the person who picked them up.

One might think that one could then acquire as much as one wished, but this is not the case. Locke introduces at least two important qualifications on how much property can be acquired. The first qualification has to do with waste. Locke writes: "As much as anyone can make use of to any advantage of life before it spoils, so much by his labor he may fix a property in; whatever is beyond this, is more than his share, and belongs to others." (II. v. 31) Since originally, populations were small and resources great, living within the bounds set by reason, there would be little quarrel or contention over property, for a single man could make use of only a very small part of what was available.

Note that Locke has, thus far, been talking about hunting and gathering, and the kinds of limitations which reason imposes on the kind of property that hunters and gatherers hold. In the next section he turns to agriculture and the ownership of land and the kinds of limitations there are on that kind of property. In effect, we see the evolution of the state of nature from a hunter/gatherer kind of society to that of a farming and agricultural society. Once again it is labor which imposes limitations upon how much land can be enclosed. It is only as much as one can work. But there is an additional qualification. Locke says:

> Nor was this *appropriation* of any parcel of *land*, by improving it, any prejudice to any other man, since there was still enough, and as good left; and more than the as yet unprovided could use. So that, in effect, there was never the less for others because of his inclosure for himself: for he that leaves as much as another can make use of, does as good as take nothing at all. No body could consider himself injured by the drinking of another man, though he took a good draught, who had a whole river of the same water left to quench his thirst: and the case of land and water, where there is enough, is perfectly the same. (II. v. 33)

The next stage in the evolution of the state of nature involves the introduction of money. Locke remarks that:

> . ... before the desire of having more than one needed had altered the intrinsic value of things, which depends only on their usefulness to the life of man; or had agreed, that a little piece of yellow metal, which would keep without wasting or decay, should be worth a great piece of flesh, or a whole heap of corn; though men had a right to appropriate by their labor, each one of himself, as much of the things of nature, as he could use; yet this could not be much, nor to the prejudice of others, where the same plenty was left to those

> who would use the same industry. (II. 5. 37.)

So, before the introduction of money, there was a degree of economic equality imposed on mankind both by reason and the barter system. And men were largely confined to the satisfaction of their needs and conveniences. Most of the necessities of life are relatively short lived -- berries, plums, venison and so forth. One could reasonably barter one's berries for nuts which would last not weeks but perhaps a whole year. And says Locke:

> ...if he would give his nuts for a piece of metal, pleased with its color, or exchange his sheep for shells, or wool for a sparkling pebble or diamond, and keep those by him all his life, he invaded not the right of others, he might heap up as much of these durable things as he pleased; the exceeding of the bounds of his property not lying in the largeness of his possessions, but the perishing of anything uselessly in it. (II. 5. 146.)

The introduction of money is necessary for the differential increase in property, with resulting economic inequality. Without money there would be no point in going beyond the economic equality of the earlier stage. In a money economy, different degrees of industry could give men vastly different proportions. "This partage of things in an inequality of private possessions, men have made practicable out of the bounds of society, and without compact, only by putting a value on gold and silver, and tacitly agreeing to the use of money: for in governments, the laws regulate the rights of property, and the possession of land is determined by positive constitutions." (II. 5. 50) The implication is that it is the introduction of money, which causes inequality, which in turn causes quarrels and contentions and increased numbers of violations of the law of nature. This leads to the decision to create a civil government. Before turning to the institution of civil government, however, we should ask what happens to the qualifications on the acquisition of property after the advent of money? One answer proposed by C. B. Macpherson is that the qualifications are completely set aside, and we now have a system for the unlimited acquisition of private property. This does not seem to be correct. It seems plain, rather, that at least the non-spoilage qualification is satisfied, because money does not spoil. The other qualifications may be rendered somewhat irrelevant by the advent of the conventions about property adopted in civil society. This leaves open the question of whether Locke approved of these changes. Macpherson, who takes Locke to be a spokesman for a proto-capitalist system, sees Locke as advocating the unlimited acquisition of wealth. According to James Tully, on the other side, Locke sees the new conditions, the change in values and the economic inequality which arise as a result of the advent of money, as the fall of man. Tully sees Locke as a persistent and powerful critic of self-interest. This remarkable difference in interpretation has been a significant topic for debates among scholars over the last forty years. Let us then, turn to the institution of civil government.

The institution of civil government comes about because of the difficulties in the state of nature. Rather clearly, on Locke's view, these difficulties increase with the increase in population, the decrease in available resources, and the advent of economic inequality which results from the introduction of money. These conditions lead to an increase in the number of violations of the natural law. Thus, the inconvenience of having to redress such grievances on one's own behalf become much more acute, since there are significantly more of them. These lead to the introduction of civil government.

3.3 The Social Contract Theory

Just as natural rights and natural law theory had a florescence in the 17th and 18th century, so did the social contract theory. Why is Locke a social contract theorist? Is it merely that this was one prevailing way of thinking about government at the time which Locke blindly adopted? I think the answer is that there is something about Locke's project which pushes him strongly in the direction of the social contract. One might hold that governments were originally instituted by force, and that no agreement was involved. Where Locke to adopt this view, he would be forced to go back on many of the things which are at the heart of his project in the *Second Treatise*. Remember that *The Second Treatise* provides Locke's positive theory of government, and that he explicitly says that he must do this "lest men fall into the dangerous belief that "all government in the world is merely the product of force and violence." So, while Locke might admit that some governments come about through force or violence, he would be destroying the most central and vital distinction, that between legitimate and illegitimate civil government, if he admitted that legitimate civil government can come about in this way. So, for Locke, legitimate civil government is instituted by the explicit consent of those governed. Those who make this agreement transfer to the civil government their right of executing the law of nature and judging their own case. These are the powers which they give to the central government, and this is what makes the justice system of civil governments a legitimate function of such governments.

Ruth Grant has persuasively argued that the establishment of civil government is in effect a two step process. Universal consent is necessary to form a political community. Consent to join a community once given is binding and cannot be withdrawn. This makes political communities stable. Grant writes: "Having established that the membership in a community entails the obligation to abide by the will of the community, the question remains: Who rules?" (Grant, 1987 p. 115) The answer to this question is determined by majority rule. The point is that universal consent is necessary to establish a political community, majority consent to answer the question who is to rule such a community. Universal consent and majority consent are thus different in kind, not just in degree. Grant writes:

> Locke's argument for the right of the majority is the theoretical ground for the distinction between duty to society and duty to government, the distinction that permits an argument for resistance without anarchy. When the designated government dissolves, men remain obligated to society acting through majority rule.

It is entirely possible for the majority to confer the rule of the community on a king and his heirs, or a group of oligarchs or on a democratic assembly. Thus, the social contract is not inextricably linked to democracy. Still, a government of any kind must perform the legitimate function of a civil government.

3.4 The Function Of Civil Government

Locke is now in a position to explain the function of a legitimate civil government and distinguish it from illegitimate civil government. The aim of such a legitimate civil government is to preserve, so far as

possible, the rights to life, liberty, health and property of its citizens, and to prosecute and punish those of its citizens who violate the rights of others others and to pursue the public good even where this may conflict with the rights of individuals. In doing this it provides something unavailable in the state of nature, an impartial judge to determine the severity of the crime, and to set a punishment proportionate to the crime. This is one of the main reasons why civil society is an improvement on the state of nature. An illegitimate civil government will fail to protect the rights to life, liberty, health and property of its subjects, and in the worst cases, such an illegitimate government will claim to be able to violate the rights of its subjects, that is it will claim to have despotic power over its subjects. Since Locke is arguing against the position of Sir Robert Filmer who held that patriarchal power and political power are the same, and that in effect these amount to despotic power, Locke is at pains to distinguish these three forms of power, and to show that they are not equivalent. Thus at the beginning of Chapter XV Of Paternal, Political and Despotic power considered together he writes: "THOUGH I have had occasion to speak of these before, yet the great mistakes of late about government, having as I suppose arisen from confounding these distinct powers one with another, it may not be amiss, to consider them together." Chapters VI and VII give Locke's account of paternal and political power respectively. Paternal power is limited. It lasts only through the minority of children, and has other limitations. Political power, derived as it is from the transfer of the power of individuals to enforce the law of nature, has with it the right to kill in the interest of preserving the rights of the citizens or otherwise supporting the public good. Despotic power, by contrast, implies the right to take the life, liberty, health and at least some of the property of any person subject to such a power.

3.5 Rebellion and Regicide

At the end of the Second Treatise we learn about the nature of illegitimate civil governments and the conditions under which rebellion and regicide are legitimate and appropriate. As noted above, scholars now hold that the book was written during the Exclusion crisis, and may have been written to justify a general insurrection and the assassination of the king of England and his brother. The argument for legitimate revolution follows from making the distinction between legitimate and illegitimate civil government. A legitimate civil government seeks to preserve the life, health, liberty and property of its subjects, insofar as this is compatible with the public good. Because it does this it deserves obedience. An illegitimate civil government seeks to systematically violate the natural rights of its subjects. It seeks to make them illegitimate slaves. Because an illegitimate civil government does this, it puts itself in a state of nature and a state of war with its subjects. The magistrate or king of such a state violates the law of nature and so makes himself into a dangerous beast of prey who operates on the principle that might makes right, or that the strongest carries it. In such circumstances, rebellion is legitimate as is the killing of such a dangerous beast of prey. Thus Locke justifies rebellion and regicide (regarded by many during this period as the most heinous of crimes) under certain circumstances. Presumably this was the justification that was going to be offered for the killing of the King of England and his brother had the Rye House Plot succeeded.

4. Locke and Religious Toleration

In England itself, religious conflict dominated the 17th century, contributing in important respects to the coming of the English civil war, and the abolishing of the Anglican Church during the Protectorate. After the Restoration of Charles II, Anglicans in parliament passed laws which repressed both Catholics and Protestant sects such as Presbyterians, Baptists, Quakers and Unitarians who did not agree with the doctrines or practices of the state Church. Of these various dissenting sects, some were closer to the Anglicans, others more remote. One reason among others why King Charles may have found Shaftesbury useful was that they were both concerned about religious toleration. They parted when it became clear that the King was mainly interested in toleration for Catholics, and Shaftesbury of Protestant dissenters.

One widely discussed strategy for reducing religious conflict in England was called comprehension. The idea was to reduce the doctrines and practices of the Anglican church to a minimum so that most, if not all, of the dissenting sects would be included in the state church. For those which even this measure would not serve, there was to be toleration. Toleration we may define as a lack of state persecution. Neither of these strategies made much progress during the course of the Restoration.

What were Locke's religious views and where did he fit into the debates about religious toleration? This is a quite difficult question to answer. Religious persecution creates a situation where it might well be wise to conceal one's actual views. It is clear that Newton did this and did it in collaboration with Locke (McLachlan, 1941). Given this, what can we say about Locke? Religion and Christianity in particular is perhaps the most important influence on the shape of Locke's philosophy. But what kind of Christian was Locke? Locke's family were Puritans. At Oxford, Locke avoided becoming an Anglican priest. Still, Locke's nineteenth century biographer Fox Bourne thought that Locke was an Anglican. Others have identified him with the Latitudinarians -- a movement among Anglicans to argue for a reasonable Christianity that dissenters ought to accept. This would seem to comport well with Locke's attempt in the *The Reasonableness of Christianity* to reduce the doctrines and practices required to be a Christian to a bare minimum. Still, there are some reasons to think that Locke was neither an Anglican or a Latitudinarian. Locke got Isaac Newton to write Newton's most powerful anti-Trinitarian tract. Locke arranged to have the work published anonymously in Holland (though in the end Newton decided not to publish). This strongly suggests that Locke too was a unitarian. Given that one main theme of Locke's Letter on Toleration is that there should be a separation between Church and State, this does not seem like the view of a man devoted to a state religion. It might appear that Locke's writing *The Reasonableness of Christianity* in which he argues that the basic doctrines of Christianity are few and compatible with reason make him a Latitudinarian. Yet Richard Ashcraft has argued that that comprehension for the Anglicans meant conforming to the existing practices of the Anglican Church; that is, the abandonment of religious dissent. Ashcraft also suggests that Latitudinarians were thus not a moderate middle ground between contending extremes but part of one of the extremes -- "the acceptable face of the persecution of religious dissent." (Ashcraft in Kroll, Ashcraft and Zagorin 1992 p. 155) Ashcraft holds that while the Latitudinarians may have represented the ‘rational theology’ of the Anglican church, there was a competing dissenting ‘rational theology’ Thus, while it is true that Locke had Latitudinarian friends, given Ashcraft's distinction between Anglican and dissenting "rational theologies", it is entirely possible that *The Reasonableness of Christianity* is a work of dissenting "rational theology."

Locke had been thinking, talking and writing about religious toleration since 1659. He and Shaftesbury had instituted religious toleration in the *Fundamental Constitution of the Carolinas.* He wrote the *Epistola de Tolerentia* in Latin in 1685 while in exile in Holland. He very likely was seeing Protestant refugees pouring over the borders from France where Louis XIV had just revoked the Edict of Nantes. Holland itself was a Calvinist theocracy with significant problems with religious toleration. But Locke's Letter does not confine itself to the issues of the time. Locke gives a principled account of religious toleration, though this is mixed in with arguments which apply only to Christians, and perhaps in some cases only to Protestants. He gives his general defense of religious toleration while continuing the anti-Papist rhetoric of the Country party which sought to exclude James II from the throne.

Locke's arguments for religious toleration connect nicely to his account of civil government. Locke defines life, liberty, health and property as our civil interests. These are the proper concern of a magistrate or civil government. The magistrate can use force and violence where this is necessary to preserve civil interests against attack. This is the central function of the state. One's religious concerns with salvation, however, are not within the domain of civil interests, and so lie outside of the legitimate concern of the magistrate or the civil government. In effect, Locke adds an additional right to the natural rights of life, liberty, health and property -- the right of freedom to choose one's own road to salvation.

Locke holds that the use of force by the state to get people to hold certain beliefs or engage in certain ceremonies or practices is illegitimate. The chief means which the magistrate has at her disposal is force, but force is not an effective means for changing or maintaining belief. Suppose then, that the magistrate uses force so as to make people profess that they believe. Locke writes:

> A sweet religion, indeed, that obliges men to dissemble, and tell lies to both God and man, for the salvation of their souls! If the magistrate thinks to save men thus, he seems to understand little of the way of salvation; and if he does it not in order to save them, why is he so solitious of the articles of faith as to enact them by a law. (Mendus, 1991. p. 41)

So, religious persecution by the state is inappropriate. Locke holds that "Whatever is lawful in the commonwealth cannot be prohibited by the magistrate in the church." This means that the use of bread and wine, or even the sacrificing of a calf could not be prohibited by the magistrate.

If there are competing churches, one might ask which one should have the power? The answer is clearly that power should go to the true church and not to the heretical church. But Locke claims, this amounts to saying nothing. For, every church believes itself to be the true church, and there is no judge but God who can determine which of these claims is correct. Thus, skepticism about the possibility of religious knowledge is central to Locke' argument for religious toleration.

Bibliography

Locke's Works

Oxford University Press is in the process of producing a new edition of all of Locke's works. This will supersede *The Works of John Locke* of which the 1823 edition is probably the most standard. The new Clarendon editions began with Peter Nidditch's edition of *An Essay Concerning Human Understanding* in 1975. The Oxford Clarendon editions contain much of the material of the Lovelace collection, purchased and donated to Oxford by Paul Mellon. This treasure trove of Locke's works and letters, which includes early drafts of the *Essay* and much other material, comes down from Peter King, Locke's nephew, who inherited Locke's papers. Access to these papers has given scholars in the twentieth century a much better view of Locke's philosophical development and provided a window into the details of his activities which is truly remarkable. Hence the new edition of Locke's works will very likely be definitive.

In addition to the Oxford Press edition, there are a few editions of some of Locke's works which are worth noting.

- Laslett, Peter *Locke's Two Treatises of Government*, Cambridge, Cambridge University Press.
- Richard Aschcraft, The Two Treatises of Civil Government
- Abrams, Phillip, *John Locke, Two Tracts of Government*, Cambridge University Press.

Notes to John Locke

Notes

1. The scope of the activities engaged in by members of the Royal Society was much broader than what we recongize as modern science. The very idea of science was emerging during this period. Thus, only a minority of the early members were what we would call scientists. Similar societies were being founded in other European countries during this period. The Society still exists today and is one of the pillars of tthe orthodox scientific establishment in England. To be a member of it today implies that one has made a substantial contribution to experimental or theoretical science and membership thus confers the highest prestige. For more information about the Royal Society, one might consult Chapter 5 in Woolhouse (1988).

2. This controversy is of some interest for a variety of reasons. The constitution, for example, has quite liberal views concerning the formation of churches. Consider provision CIX for example. It reads: "No person whatsoever shall distu rb, molest, or persecute another for his speculative opinions in religion, or his way of worship." Was Locke responsible for this provision? On the other hand, Sir Leslie Stephan charged Locke with personal racism for inserting section CX: "Every freeman of Carolina shall have absolute power and authority over his negro slaves, of what opinion or religion soever." There is some evidence to suggest that Locke did play a part in formulating the sections on religion -- though it is possible this may have b e en at the bidding of Lord Ashley. Sir John Colleton is a much more likely candidate for the authorship of the sentence about negro slaves. Colleton, the real originator of the Carolinas project and one of the proprietors, was a Barbados planter who owned slaves. Part of the plan for the Carolinas was that people were going to emigrate from the overcrowed Barbados taking their slaves with them. They might well worry about whether this move might endanger the power they held over their slaves. It would be natural for Colleton to propose such a clause to allay their fears. Thus the inclusion of this clause may well say little or nothing about Locke's views.

3. Some commentators distinguish between the corpuscular and the atomic hypotheses on the grounds that corpuscles may be only relatively simple while atoms are supposed to be genuinely indivisible. (See Jolley, 1999) Thus it is possible to be committed to the existence of corpuscles but not atoms. While this distinction has its uses (especially in taking about the simplicity of simple ideas) I am convinced that in respect to physical corpuscles or atoms that Locke treats the two hypotheses as equivalent. One would expect that if the distinction were important for Locke, if he did believe in the existence of corpuscles but not atoms, he would not regularly use the terms ‘atom’ or ‘atoms’, but he does.

Stanford Encyclopedia of Philosophy
Supplement to John Locke

The Immateriality of the Soul and Personal Identity

Both in his discussion of personal identity and in his discussion of the immateriality of the soul in Book IV of the *Essay* Locke is agnostic about the immateriality of the soul. In Book IV he suggests that immateriality is not needed for the great ends of religion, and in Book II he crafts a theory of personal identity that does not require (though it is not inconsistent with) the immateriality of the soul.

The Immateriality of the Soul

In giving us his estimate of the limits of human understanding, Locke made some claims which surprised his contemporaries. In IV 3, 6 he suggests that given our ignorance of substances, it was possible that God could make matter fitly disposed think. He suggested that it was no farther beyond our comprehension motions of the body could give rise to pleasure and pain than that an immaterial soul could feel pain after the occurrence of some motions in the body. He suggested that the immateriality of the soul was not particularly important. In a passage from Book IV, Chapter 2, section 6, Locke writes:

> All the great ends of Morality and Religion, are well enough secured without the philosophical Proofs of the Soul's Immateriality; since it is evident that he who, at first made us beings to subsist here, sensible intelligent Beings, and for several years continued us in such a state, can and will restore us to a like state of Sensibility in another World, and make us there capable to receive the Retribution he has designed to men, according to the doings in this life. And therefore tis not a mighty necessity to determine one way or t'other, as some overzealous for or against the Immateriality of the Soul, have been foreward to make the World believe.

These suggestions were often taken as stronger than intended. Many of Locke's critics were suspicious that Locke had materialist tendencies. Instead of the skeptical conclusions about immaterial versus material substance which Locke is clearly arguing for, his remarks were sometimes treated as proposing that matter can and does think. It hardly matters however. Samuel Clarke, for example, a student of Newton's and an orthodox Anglican theologian, engaged in a debate by correspondence or rather public pamphlet with Anthony Collins over this issue between 1706 and 1708. Clarke sought to show that from our ideas alone it would be possible to show that matter thinking would involve a contradiction. If Clarke is right, Locke (even on the weaker interpretation I am proposing) would be wrong. There was an explosion of refutations of the claim that for all we know matter can think and the discussion of this issue lasted at least three quarters of the way through the eighteenth century.

Personal Identity

Locke added his Chapter "Of Identity and Diversity" (II. xxvii) which gives his account of identity and personal identity to the second edition of the *Essay*. Locke's account of personal identity turned out to be revolutionary. His account of personal identity is embedded in a general account of identity. In this general account of identity Locke distinguishes between the identity of atoms, masses of atoms and living things. Each individual atom is the same at a time, and stays the same over time. So, there is no problem about the identity of atoms. Masses of atoms are individuated by their constituent atoms without regard to the way in which they are organized. Living things, by contrast, are individuated by their functional organization. This organization is instantiated at any time by a collection of atoms. But the organization can persist through changes in the particles which make it up -- at least gradual change which continues the functions which the organization performs. Clearly the most important of these functions is the continuation of the same life. It is the continuation of the same functional organization and thus the same life which is the criterion of identity for sameness of living thing, be it an oak or a horse. Locke holds that man is an animal and is thus individuated just like other living things. So ‘man’ refers to a living body of a particular shape. Locke is perfectly aware that the definition of man is not really settled, and that there are a variety of competing definitions. He argues for his own definition, which involves distinguishing between ‘man’ and ‘person’ by using a variety of thought experiments and deducing unacceptable consequences from competing definitions. He points our, for example, that while those who individuate man solely in terms of the possession of a soul can explain the sameness of man from infancy to old age, if they accept some doctrine of reincarnation, their definition requires that the same soul in different bodies be the same man as much as infant and old man. If the doctrine of reincarnation allows the soul of a man to be reborn in the body of an animal, such as a hog, if we knew that the soul of a man was in one of our hogs, it would require us to call the hog a man. Locke pairs the examples of a rational talking parrot with a creature that has the shape of a man but cannot engage in rational discourse as a thought experiment which demonstrates that rational discourse is neither a necessary or sufficient condition for being a man. If man is a living body, an animal of a certain shape, then what is a person? A person is an intelligent thinking being that can know itself as itself the same thinking thing in different times and places.

Why does Locke make this distinction between ‘man’ and ‘person?’ One answer is that the distinction solves the problem of the resurrection of the dead. What is this problem? The problem begins with Biblical texts asserting that we will have the same body at the Resurrection as we did in this life. The issue is in what sense this is true. Clearly there are problems with the supposition that one will. Robert Boyle, in his essay, "Some Physico-Theological Considerations About the Possibility of the Resurrection" had raised some of these puzzles. Boyle writes:

> When a man is once really dead, divers of the parts of his body will, according to the course of nature, resolve themselves into multitudes of steams that wander to and fro in the air; and the remaining parts, that are either liquid or soft, undergo so great a corruption and change, that it is not possible so many scattered parts should be again brought together, and reunited after the same manner, wherein the existed in a human body whilst it was yet

> alive. And much more impossible it is to effect this reunion, if the body have been, as it often happens, devoured by wild beasts or fishes; since in this case, though the scattered parts of the cadaver might be recovered as particles of matter, yet already having passed into the substance of other animals, they are quite transmuted, as being informed by the new form of the beast or fish that devoured them and of which they now make a substantial part. (Robert Boyle, *Selected Philosophical Papers of Robert Boyle,* ed. M.A. Stewart, Manchester University Press, New York, 1979. p. 198.

These difficulties with putting bodies back together are obviously considerable, though not perhaps beyond the powers of Omnipotence. The culminating problem, however, is what happens to the man whose body is eaten by cannibals? Boyle continues:

> And yet far more impossible will this reintegration be, if we put the case that the dead man was devoured by cannibals; for then, the same flesh belonging successively to two different persons, it is impossible that both should have it restored to them at once, or that any footsteps should remain of the relation it had to the first possessor.

These problems I suspect represent the kinds of difficulties which faced the scientists of the Royal Society, and with which Boyle was particularly concerned, in integrating the kinds of explanations of natural phenomena in terms of particles and matter in motion, with the truths of religion.

Locke explicitly tells us that the case of the prince and the cobbler shows us the resolution of the problem of the resurrection. The case is one in which the soul of the prince with all of its princely thoughts is transferred from the body of the prince to the body of the cobbler, the cobbler's soul having departed. The result of this exchange, is that the prince still consider himself the prince, even though he finds himself in an altogether new body. Locke's distinction between man and person makes it possible for the same person to show up in a different body at the resurrection and yet still be the same person. Locke focuses on the prince with all his princely thoughts because, on his view, it is consciousness which is crucial to the reward and punishment which is to be meted out at the Last Judgment. In this chapter on identity, Locke is also making a distinction between consciousness and the soul, but that distinction is not crucial to the resolution of the kinds of problems that Boyle considered in his essay on the resurrection. Let us turn then, to the distinction between soul and consciousness.

Though the distinction between man and person is controversial, Locke's distinction between the soul or the thing which thinks in us and consciousness is even more radical. Locke holds that consciousness can be transferred from one soul to another, and that personal identity goes with consciousness. In section 12 of the Chapter of Identity and Diversity he raises the question: "...if the same Substance which thinks be changed, it can be the same person, or remaining the same, it can be a different person." Locke's answer to both of these questions is affirmative. Consciousness can be transferred from one substance to another and thus while the soul is changed, consciousness remains the same and thus personal identity is preserved through the change. And on the other hand, consciousness can be lost as in utter forgetfulness while the soul or thinking substance remains the same. Under these conditions there is the same soul but

a different person. These affirmations amount to the claim that the same soul or thinking substance is neither necessary not sufficient for personal identity over time. The arguments are developed by analogy with the functional organization of animals which is preserved through the gradual changes in the atoms which instantiate that organization at any given time. So, at any given time there must be a soul or thinking substance, but over time there is no necessity that one have the same soul to preserve personal identity.

Why does Locke make this distinction between soul and consciousness? This distinction has little bearing on problems about the same body at the resurrection. Still, the ressurection is important. I would suggest that the answer lies in Locke's interest in justice at the final judgment. Locke is skeptical about our ability to reidentify the same soul over time. He claims that if we were always awake, we could be certain that we had the same soul. But consciousness has natural gaps in it, such as periods during which we are asleep. Locke claims that there is no way of knowing that one soul has not been substituted for another during this period of absence of consciousness.

I would argue that the whole force of Locke's definition of person as a thinking intelligent being that can know itself as the same thinking thing in different times and places is designed to account for the fact that we are creatures who are capable of operating the machinery of the law. When contemplating an action we can think that in the future we will be the same being who will be punished or rewarded for the course of action which we choose. When being punished we can look back and see that we are the same being who committed the act for which we are being punished. Locke holds that consciousness is essential for justice to be done. If one is punished for doing something which one does not remember doing, it is equivalent to being created miserable. So, since consciousness plays the most important role in our being punished or rewarded at the last judgment for our actions, and consciousness can be transferred from one soul to another, and we have no mechanism to reidentify souls over time, it becomes clear why consciousness is Locke's choice for the bearer of personal identity, and why he makes the distinction between the substance which thinks in us and consciousness. I think this account explains a variety of oddities and difficulties in Locke's account. On his account, for example, memory must be completely accurate -- at least in the respects relevant for divine judicial purposes. Evidence which others might produce about one's identity has no role to play and so forth. Locke's account of freedom of action is also connected with his view of the forensic nature of personal identity. Freedom to review the decisions one has made about how to act are clearly of great importance in being able to operate the law. If one could not pause to consider, and change one•s mind about what one was going to do, it might well be said that one could not do otherwise.

David Hume

Generally regarded as the most important philosopher ever to write in English, David Hume (1711-1776) -- the last of the great triumvirate of "British empiricists" -- was also noted as an historian and essayist. A master stylist in any genre, Hume's major philosophical works -- *A Treatise of Human Nature* (1739-1740), the *Enquiries concerning Human Understanding* (1748) and *concerning the Principles of Morals* (1751), as well as the posthumously published *Dialogues concerning Natural Religion* (1779) -- remain widely and deeply influential, despite their being denounced by many of his contemporaries as works of scepticism and atheism. While Hume's influence is evident in the moral philosophy and economic writings of his close friend Adam Smith, he also awakened Immanuel Kant from his "dogmatic slumbers" and "caused the scales to fall" from Jeremy Bentham's eyes. Charles Darwin counted Hume as a central influence, as did "Darwin's bulldog," Thomas Henry Huxley. The diverse directions in which these writers took what they gleaned from reading Hume reflect not only the richness of their sources but also the wide range of Hume's empiricism. Comtemporary philosophers recognize Hume as one of the most thoroughgoing exponents of philosophical naturalism.

Life and Works

Born in Edinburgh, Hume spent his childhood at Ninewells, the family's modest estate on the Whitadder River in the border lowlands near Berwick. His father died just after David's second birthday, "leaving me, with an elder brother and a sister under the care of our Mother, a woman of singular Merit, who, though young and handsome, devoted herself to the rearing and educating of her Children." (All quotations in this section from Hume's autobiographical essay, "My Own life", reprinted in HL.)

Katherine Falconer Home realized that young David was "uncommonly wake-minded" -- precocious, in her lowland dialect -- so when his brother went up to Edinburgh University, David, not yet twelve, joined him. He studied mathematics and contemporary science, and read widely in history, literature, and ancient and modern philosophy.

Hume's family thought him suited for a career in the law, but he preferred reading classical authors, especially Cicero, whose *Offices* became his secular substitute for *The Whole Duty of Man* and his family's strict Calvinism. Pursuing the goal of becoming "a Scholar & Philosopher," he followed a rigorous program of reading and reflection for three years until "there seem'd to be open'd up to me a New Scene of Thought."

The intensity of developing this philosophical vision precipitated a psychological crisis in the isolated scholar. Believing that "a more active scene of life" might improve his condition, Hume made "a very feeble trial" in the world of commerce, as a clerk for a Bristol sugar importer. The crisis passed and he remained intent on articulating his "new scene of thought." He moved to France, where he could live frugally, and settled in La Flèche, a sleepy village in Anjou best known for its Jesuit college. Here, where Descartes and Mersenne studied a century before, Hume read French and other continental authors, especially Malebranche, Dubos, and Bayle; he occasionally baited the Jesuits with iconoclastic arguments; and, between 1734 and 1737, he drafted *A Treatise of Human Nature*.

Hume returned to England in 1737 to ready his *Treatise* for the press. To curry favor with Bishop Butler, he "castrated" his manuscript, deleting his controversial discussion of miracles, along with other "nobler parts." Book I (*Of the Understanding*) and Book II (*Of the Passions*) was published anonymously in 1739. Book III (*Of Morals*) appeared in 1740, as well as an anonymous *Abstract* of the first two books of the *Treatise*. Although other candidates, especially Adam Smith, have occasionally been proposed as the *Abstract*'s author, scholars now agree that it is Hume's work. The *Abstract* features a clear, succinct account of "one simple argument" concerning causation and the formation of belief. Hume's elegant summary presages his "recasting" of that argument in the first *Enquiry*.

The *Treatise* was no literary sensation but it didn't "fall dead-born from the press," as Hume disappointedly described its reception. Despite his surgical deletions, the *Treatise* attracted enough of a "murmour among the zealots" to fuel his life-long reputation as an atheist and a sceptic.

Back at Ninewells, Hume published two modestly successful volumes of *Essays, Moral and Political* in 1741 and 1742. When the Chair of Ethics and Pneumatical ("Mental") Philosophy at Edinburgh became vacant in 1745, Hume hoped to fill it, but his reputation provoked vocal and ultimately successful

opposition. Six years later, he stood for the Chair of Logic at Glasgow, only to be turned down again. Hume never held an academic post.

In the wake of the Edinburgh debacle, Hume made the unfortunate decision to accept a position as tutor to the Marquess of Annandale, only to find that the young Marquess was insane and his estate manager dishonest. Hume managed to extricate himself from this situation, and accepted the invitation of his cousin, Lieutenant-General James St. Clair, to be his Secretary ("I wore the uniform of an officer.") on a military expedition against the French in Quebec. Contrary winds delayed St. Clair's fleet until the Ministry canceled the plan, only to spawn a new expedition that ended as an abortive raid on the coastal town of L'Orient in Brittany.

Hume also accompanied St. Clair on an extended diplomatic mission to Vienna and Turin in 1748. While he was in Italy, the *Philosophical Essays concerning Human Understanding* appeared. A recasting of the central ideas of Book I of the *Treatise*, the *Philosophical Essays* were read and reprinted, eventually becoming part of Hume's *Essays and Treatises* under the title by which they are known today, *An Enquiry concerning Human Understanding*. In 1751, this *Enquiry* was joined by a second, *An Enquiry concerning the Principles of Morals*. Hume described the second *Enquiry*, a substantially rewritten version of Book III of the *Treatise*, as "incomparably the best" of all his works. More essays, the *Political Discourses*, appeared in 1752, and Hume's correspondence also reveals that a draft of the *Dialogues concerning Natural Religion* was underway at this time.

An offer to serve as Librarian to the Edinburgh Faculty of Advocates gave Hume the opportunity to work steadily on another project, a *History of England*, which was published in six volumes in 1754, 1756, 1759, and 1762. His *History* became a best-seller, finally giving him the financial independence he had long sought.

But even as a librarian, Hume managed to arouse the ire of the "zealots." In 1754, his order for several "indecent Books unworthy of a place in a learned Library" prompted a move for his dismissal, and in 1756, an unsuccessful attempt to excommunicate him. The Library's Trustees canceled his order for the offending volumes, which Hume regarded as a personal insult. Since he needed the Library's resources for his *History*, Hume did not resign his post; he did turn over his salary to Thomas Blacklock, a blind poet he befriended and sponsored. When research for the *History* was done in 1757, Hume quickly resigned to make the position available for Adam Ferguson.

Hume's publication of *Four Dissertations* (1757) was also surrounded by controversy. In 1755, he was ready to publish a volume that included "Of Suicide" and "Of the Immortality of the Soul." He suppressed the controversial essays when his publisher, Andrew Millar, was threatened with legal action, due largely to the machinations of the minor theologian William Warburton. Hume added "Of Tragedy" and "Of the Standard of Taste" to round out the volume, which also included *The Natural History of Religion* and *A Dissertation on the Passions*.

In 1763, Hume accepted an invitation from Lord Hertford, the Ambassador to France, to serve as his

Private Secretary. During his three years in Paris, Hume became Secretary to the Embassy and eventually its Chargè d'Affaires. He also become the rage of the Parisian salons, enjoying the conversation and company of Diderot, D'Alembert, and d'Holbach, as well as the attentions and affections of the *salonnières*, especially the Comtesse de Boufflers.

Hume returned to England in 1766, accompanied by Jean-Jacques Rousseau, who was then fleeing persecution in Switzerland. Their friendship ended quickly and miserably when the paranoid Rousseau became convinced that Hume was masterminding an international conspiracy against him.

After a year (1767-68) as an Under-Secretary of State, Hume returned to Edinburgh to stay. His autumnal years were spent quietly and comfortably, dining and conversing with friends, and revising his works for new editions of his *Essays and Treatises,* which contained his collected essays, the two *Enquiries*, *A Dissertation on the Passions*, and *The Natural History of Religion*. In 1775, he added an "Advertisement" to these volumes, in which he appeared to disavow the *Treatise*. Though he regarded this note as "a compleat Answer" to his critics, especially "Dr. Reid and that biggotted, silly fellow, Beattie," subsequent readers have wisely chosen to ignore Hume's admonition to ignore his greatest philosophical work.

Upon finding that he had intestinal cancer, Hume prepared for his death with the same peaceful cheer that characterized his life. He arranged for the posthumous publication of his most controversial work, the *Dialogues concerning Natural Religion*; it was seen through the press by his nephew and namesake in 1779, three years after his uncle's death.

The *Treatise* and the *Enquiries*

Hume's apparent disavowal of the *Treatise* raises a question as to how we should read his works. Should we take his "Advertisement" *literally* and let the *Enquiries* represent his considered view? Or should we take him *seriously* and conclude -- whatever *he* may have said or thought -- that the *Treatise* is the best statement of his position?

Both responses presuppose that there are substantial enough differences between the works to warrant our reading them as disjoint. This is highly dubious. Even in the "Advertisement," Hume says that "most of the principles, and reasonings, contained in this volume, were published" in the *Treatise*, and that he has "cast the whole anew in the following pieces, where some negligences in his former reasoning and more in the expression, are...corrected" (EHU, "Advertisement"). Despite his protests, this hardly sounds like the claims of one who has genuinely repudiated his earlier work.

Hume reinforced this perspective when he wrote Gilbert Elliot of Minto that "the philosophical principles are the same in both...by shortening and simplifying the questions, I really render them much more complete" (HL, I:158). And in "My Own Life," he opined that the *Treatise's* lack of success "proceeded more from the manner than the matter." Hume's "recasting" of the *Treatise* was probably designed primarily to address this point. This brief overview of Hume's central views on method, epistemology, and ethics therefore follows the structure -- "the manner" -- of the *Enquiries* and emphasizes "the matter"

they have in common with the *Treatise*.

Method

In his Introduction to the *Treatise,* Hume bemoans the sorry state of philosophy, evident even to "the rabble without doors," which has given rise to "that common prejudice against metaphysical reasonings of all kinds" (T, xiv). He hopes to correct this miserable situation by introducing "the experimental method of reasoning into moral subjects," establishing "a science of human nature" that will put philosophy on a "solid foundation" of "experience and observation" (T, Introduction).

Hume's positive, naturalistic project has much in common with contemporary cognitive science. Recent readers have paid more attention to these aspects of his philosophy than his earlier critics apparently did. As a result, no contemporary Hume scholar entirely accepts the traditional view that Hume was solely a negative philosopher whose goal was to make manifest the sceptical consequences of the views of his empiricist predecessors. But there remains considerable disagreement about the role and extent of scepticism in his philosophy, and disagreement about its relation to the naturalistic elements of his system. What Hume says about his aims and method helps clarify these issues.

In *An Enquiry concerning the Principles of Morals,* Hume says that he will "follow a very simple method," which will nonetheless bring about "a reformation in moral disquisitions" like that already accomplished in natural philosophy, where we have been cured of "a common source of illusion and mistake" -- our "passion for hypotheses and systems." To make parallel progress in the moral sciences, we should "reject every system...however subtle or ingenious, which is not founded on fact and observation," and "hearken to no arguments but those which are derived from experience" (EPM, 173-175).

The "hypotheses and systems" Hume rejects cover a wide range of philosophical and theological views. These theories were too entrenched, too influential, and too different from his proposed science of human nature to permit him just to present his "new scene of thought" as their replacement. He needed to show why we should reject these theories, so that he might have space to develop his own.

Hume outlines this strategy in the first section of *An Enquiry concerning Human Understanding*. He considers two prominent types of "false metaphysics" (EHU, 12). Though each type has as its basis an appealing human characteristic, both views extend their accounts of these characteristics beyond their basis in experience, and so beyond the bounds of cognitive content.

The first view looks at humans as active creatures, driven by desires and feelings. It paints a flattering picture of human nature, easy to understand and even easier to accept. These philosophers make us *feel* what they *say* about our feelings, and what they say is so useful and agreeable that ordinary people who encounter these views are readily inclined to accept them. This view might be called *sentimentalism*. It is a generic characterization of the position defended in Hume's time by Shaftesbury and Francis Hutcheson.

The other view downgrades sentiment to concentrate on *rationality*, which it treats as the distinctive human characteristic. This view glorifies the reasonable aspects of our natures and appeals to them in its emphasis on rarefied speculation and abstract argument. The systems of Descartes and other rationalist philosophers fit this general description. Given its emphasis on the role of the intellect, this view might be called *intellectualism.*

Intellectualism and sentimentalism seem to be exhaustive alternatives, ways of characterizing the ancient debate as to whether reason or passion is, or should be, the dominant force in human life. Hume saw that *both* approaches capture important aspects of human nature, but that *neither* tells the whole story. We are active *and* reasonable creatures. A view that mixes both styles of philosophy will be best, so long as it gets the mixture right.

But getting the mixture right, Hume realized, is no easy task. Intellectualism is too abstract, too remote from ordinary life to have any practical application. It can indulge the worst excesses of human vanity, especially when it treats matters that are beyond the limits of human understanding. It can be co-opted by popular superstitions, peddling religious fears and prejudices cloaked in profound-sounding but meaningless metaphysical jargon.

It is tempting to react to these features of intellectualism by arguing that we should abandon metaphysics altogether. But ordinary life doesn't equip us to do good metaphysics, and without some measure of accurate metaphysical description, sentimentalism can't be as precise as it should be. Delicate sentiment requires just reasoning, and an adequate account of just reasoning requires an accurate and precise metaphysics. The only way to correct sentiment and to avoid the sources of error and uncertainty rooted in intellectualism, is to do more metaphysics -- but of the right kind. We must pursue *true metaphysics* if we want to jettison these false and deceptive views.

Hume's insight was to see that getting the correct mixture requires a two-fold task, with negative and positive aspects. To develop a science of human nature, it is first necessary to undermine the foundations of all forms of false and misleading metaphysics. When we are rid of these sources of superstition, prejudice, and error, the stage will be clear for the kind of mental geography that constitutes true metaphysics. Accurate, just reasoning about human nature -- the descriptive project of true metaphysics -- requires us to examine the scope and limits of our cognitive capacities, so that we may at last obtain an exact picture of the powers and limitations of human understanding.

The negative phase of Hume's project scrutinizes the central arguments of the dominant philosophical and theological views of his day and exposes the lack of cognitive content in their key notions. Hume's sceptical arguments are an important part of this negative phase. Since these arguments are among the most prominent and powerful Hume has to offer, it is not surprising that they are often mistaken for his final view. But these arguments function as *reductios* of theories he rejects, not as parts of the positive position he offers in their place. They point up the poverty of false metaphysics to rid us of the temptation of doing metaphysics this way. Only then will we be ready for the positive phase -- true metaphysics,

which will replace the old incoherent metaphysics with the careful accurate description that is the proper goal of philosophy.

Empiricism

This combination of negative and positive aims is a distinguishing feature of Hume's particular brand of empiricism, and the strategy he devised to achieve these aims is revelatory of his philosophical genius. For Hume, all the materials of thinking -- *perceptions* -- are derived either from *sensation* ("outward sentiment") or from *reflection* ("inward sentiment") (EHU, 19). He divides perceptions into two categories, distinguished by their different degrees of force and vivacity. Our "more feeble" perceptions, *ideas*, are ultimately derived from our livelier *impressions*(EHU, Section II).

Although we permute and combine ideas in imagination to form complex ideas of things we haven't experienced, our creative powers extend no farther than "the materials afforded us by the senses and experience." *Complex ideas* are composed of *simple ideas*, which are fainter copies of the simple impressions from which they are ultimately derived, to which they correspond and exactly resemble. Hume offers this "general proposition" as his "first principle...in the science of human nature" (T, 7). Usually called the "Copy Principle," Hume's distinctive brand of empiricism is often identified with his commitment to it.

Hume presents the Copy Principle as an empirical thesis. He emphasizes this point by offering, in both the *Treatise* and the first *Enquiry*, as an empirical counterexample to the principle, "one contradictory phenomenon" (T, 5-6; EHU, 20-21) -- the infamous missing shade of blue. Hume asks us to consider "a person to have enjoyed his sight for thirty years, and to have become perfectly well acquainted with colours of all kinds, excepting one particular shade of blue..."(T, 6). Then

"Let all the different shades of that colour, except that single one, be plac'd before him, descending gradually from the deepest to the lightest; 'tis plain, that he will perceive a blank, where that shade is wanting, and will be sensible, that there is a greater distance in that place betwixt the contiguous colours, than in any other. Now I ask, whether 'tis possible for him, from his own imagination, to supply this deficiency, and raise up to himself the idea of that particular shade, tho' it had never been conveyed to him by his senses? I believe there are few but will be of the opinion that he can; and this may serve as a proof, that the simple ideas are not always derived from the correspondent impressions; tho' the instance is so particular and singular, that 'tis scarce worth our observing, and does not merit that for it alone we should alter our general maxim" (T 6). Hume's critics have objected that, in offering this counterexample, he either unwittingly destroys the generality of the Copy Principle, which he needs, given the uses to which he will put it, or else his dismissive attitude toward the counterexample reflects his disingenuous willingness to apply the Copy Principle arbitrarily, while pretending that it really possesses the generality his uses of it require.

Hume's defenders, on the other hand, maintain either that he should have granted that the imaginative construction of the missing shade really produces a *complex* idea, or that he should have insisted that

such counterexamples are exceedingly rare, and that the contentious metaphysical ideas, the cognitive content of which he uses the Copy Principle to critique, are not possibly ideas that could be generated by the imagination in the way the missing shade is supposedly generatred.

These defenses have their attractive points, but there is a far more satisfying resolution of the issue the missing shade raises available to Hume. In Book II of the *Treatise*, he describes a similar remarkably similar phenomenon that occurs with certain passions:

"Ideas may be compar'd to the extension and solidity of matter, and impressions, especially reflective ones, to colours, tastes, smells and other sensible qualities. Ideas never admit of a total union, but are endow'd with a kind of impenetrability, by which they exclude each other, and are capable of forming a compound by their conjunction, not by their mixture. On the other hand, impressions and passions are susceptible of an entire union; and like colours, may be blended so perfectly together, that each of them may lose itself, and contribute only to vary that uniform impression, which arises from the whole. Some of the most curious phaenomena of the human mind are deriv'd from this property of the passions" (T 366).

In these cases of "impressions and passions," both of which are simples for Hume, two impressions or two passions are *blended* to form a third, which is also a simple impression or passion. It seems plausible to think, and Hume's language in this passage certainly suggests as much, that one's ideas of two shades of (say) blue could also be blended to produce a third simple idea -- an idea of the missing shade.

While Hume's empiricism is usually identified with the Copy Principle, it is actually his use of its *reverse* in his account of *definition* that is really the most distinctive element of his empiricism.

Believing that "the chief obstacle...to our improvement in the moral or metaphysical sciences is the obscurity of the ideas, and ambiguity of the terms" (EHU, 61), Hume argued that conventional definitions -- defining terms in terms of other terms -- replicate philosophical confusions by substituting synonyms for the original and thus never break out of a narrow "definitional circle." Determining the cognitive content of an idea or term requires something else.

Hume supplied what was required with his account of definition, which offers a simple series of tests to determine cognitive content. First, find the idea to which a term is annexed. If none can be found, then the term has no content, however prominently it may figure in philosophy or theology. If the idea is complex, break it up into the simple ideas of which it is composed. Then trace the simple ideas back to their original impressions: "These impressions are all strong and sensible. They admit not of ambiguity. They are not only placed in a full light themselves, but may throw light on their correspondent ideas, which lie in obscurity" (EHU, 62).

If the process fails at any point, the idea in question lacks cognitive content. When carried out successfully, it yields a full account -- a "just definition" -- of the troublesome idea or term; a Humean definition gives us its exact cognitive content. So, whenever we are suspicious that a "philosophical term

is employed without any meaning or idea (as is too frequent), we need but enquire, *from what impression is that supposed idea derived*? And if it be impossible to assign any, this will serve to confirm our suspicion. By bringing ideas into so clear a light we may reasonably hope to remove all dispute, which may arise, concerning their nature and reality" (EHU, 22).

Hume's account of definition is not only the most distinctive feature of his empiricism, it is also a brilliant strategic device. He regards it as "a new microscope or species of optics, by which, in the moral sciences, the most minute, and most simple ideas may be so enlarged as to fall readily under our apprehension, and be equally known with the grossest and most sensible ideas, that can be the object of our enquiry" (EHU, 62).

Association

The Copy Principle accounts for the *origins* of our ideas. But our ideas are also regularly *connected*. As Hume put the point in his "Abstract" of the *Treatise*, "there is a secret tie or union among particular ideas, which causes the mind to conjoin them more frequently together, and makes the one, upon its appearance, introduce the other" (T, 662).

A science of human nature should account for these connections. Otherwise, we are stuck with an *eidetic atomism* -- a set of discrete, independent ideas, unified only in that they are the contents of a particular mind. Eidetic atomism thus fails to explain how ideas are "bound together," and its inadequacy in this regard encourages us, as Hume thought it encouraged Locke, to postulate theoretical notions -- power and substance being the most notorious -- to account for the connections we find among our ideas. Eidetic atomism is thus a prime source of the philosophical "hypotheses" Hume aims to eliminate.

The principles required for connecting our ideas aren't theoretical and rational; they are natural operations of the mind, *associations* we experience in "internal sensation." Hume's introduction of these "principles of association" is the other distinctive feature of his empiricism, so distinctive that in the *Abstract* he advertises it as his most original contribution: "If any thing can intitle the author to so glorious a name as that of an inventor, 'tis the use he makes of the principle of the association of ideas" (T, 661-662).

Hume locates "three principles of connexion" or association: resemblance, contiguity, and cause and effect. Of the three, causation is the only principle that takes us "beyond the evidence of our memory and senses." It establishes a link or connection between past and present experiences with events that we predict or explain, so that "all reasonings concerning matter of fact seem to be founded on the relation of cause and effect." But causation and the ideas closely related to it also raise serious metaphysical problems: "there are no ideas, which occur in metaphysics, more obscure and uncertain, than those of power, force, energy or necessary connexion" (EHU, 61-62).

Hume wants to "fix, if possible, the precise meaning of these terms, and thereby remove some part of that obscurity, which is so much complained of in this species of philosophy" (EHU, 62). This project provides a crucial experiment for Hume's metaphysical microscope, one designed to prove the worth of

his method, to provide a paradigm for investigating problematic philosophical and theological notions, and to supply valuable material for these inquiries.

Causation: The Negative Phase

Hume's strategy dictates that he first show that alternative accounts of our "causal reasonings" are inadequate. This negative project directs his metaphysical microscope toward the intellectualist view that causal connections are made on the basis of the operations of the understanding. Hume proceeds by examining all of the possible ways in which our "causal reasonings" might be based on reason.

Reasoning concerns either *relations of ideas* or *matters of fact*. Hume quickly establishes that, whatever assures us that a causal relation obtains, it is not reasoning concerning relations between ideas. Effects are distinct events from their causes: we can always conceive of one such event occurring and the other not. So causal reasoning can't be *a priori* reasoning.

Causes and effects are discovered, not by reason but through experience, when we find that particular objects are constantly conjoined with one another. We tend to overlook this because most ordinary causal judgments are so familiar; we've made them so many times that our judgment seems immediate. But when we consider the matter, we realize that "an (absolutely) unexperienced reasoner could be no reasoner at all" (EHU, 45n). Even in applied mathematics, where we use abstract reasoning and geometrical methods to apply principles we regard as laws to particular cases in order to derive further principles as consequences of these laws, the discovery of the original law itself was due to experience and observation, not to *a priori* reasoning.

Even after we have experience of causal connections, our conclusions from those experiences aren't based on any reasoning or on any other process of the understanding. They are based on our past experiences of similar cases, without which we could draw no conclusions at all.

But this leaves us without any link between the past and the future. How can we justify extending our conclusions from past observation and experience to the future? The connection between a proposition that summarizes past experience and one that predicts what will occur at some future time is surely not an intuitive connection; it needs to be established by reasoning or argument. The reasoning involved must either be *demonstrative,* concerning relations of ideas, or *probable,* concerning matters of fact and existence.

There is no room for demonstrative reasoning here. We can always conceive of a change in the course of nature. However unlikely it may seem, such a supposition is intelligible and can be distinctly conceived. It therefore implies no contradiction, so it can't be proven false by *a priori* demonstrative reasoning.

Probable reasoning can't establish the connection, either, since it is based on the relation of cause and effect. What we understand of that relation is based on experience and any inference from experience is

based on the supposition that nature is uniform -- that the future will be like the past.

The connection could be established by adding a premise stating that nature is uniform. But how could we justify such a claim? Appeal to experience will either be circular or question-begging. For any such appeal must be founded on some version of the uniformity principle itself -- the very principle we need to justify.

This argument exhausts the ways reason might establish a connection between cause and effect, and so completes the negative phase of Hume's project. The explanatory model of human nature which makes reason prominent and dominant in thought and action is indefensible. Scepticism about it is well-founded: the model must go.

Hume insists that he offers his "sceptical doubts about the operations of the understanding," not as "discouragement, but rather an incitement...to attempt something more full and satisfactory" (EHU, 26). Having cleared a space for his own account, Hume is now ready to do just that.

Causation: The Positive Phase

Hume's negative argument showed that our causal expectations aren't formed on the basis of reason. But we do form them, and "if the mind be not engaged by argument...it must be induced by some other principle of equal weight and authority" (EHU, 41).

This principle can't be some "intricate or profound" metaphysical argument Hume overlooked. For all of us -- ordinary people, infants, even animals -- "improve by experience," forming causal expectations and refining them in the light of experience. Hume's "sceptical solution" limits our inquiries to common life, where no sophisticated metaphysical arguments are available and none are required.

When we examine experience to see how expectations are actually produced, we discover that they arise after we have experienced "the constant conjunction of two objects;" only then do we "expect the one from the appearance of the other." But when "repetition of any particular act or operation produces a propensity to renew the same act or operation...we always say, that this propensity is the effect of *Custom*" (EHU, 43).

So the process that produces our causal expectations is itself causal. Custom or habit "determines the mind...to suppose the future conformable to the past." But if this background of experienced constant conjunctions was all that was involved, then our "reasonings" would be merely hypothetical. Expecting that fire will warm, however, isn't just *conceiving o*f its warming, it is *believing that* it will warm. Belief requires that there also be some fact present to the senses or memory, which gives "strength and solidity to the related idea." In these circumstances, belief is as unavoidable as is the feeling of a passion; it is "a species of natural instinct," "the necessary result of placing the mind" in this situation.

Belief is "a peculiar sentiment, or lively conception produced by habit" that results from the *manner* in which ideas are conceived, and "in their feeling to the mind." It is "nothing but a more vivid, lively, forcible, firm, steady conception of an object, than what the imagination alone is ever able to attain" (EHU, 49). Belief is thus "more an act of the sensitive, than of the cogitative part of our natures" (T, 183), so that "all probable reasoning is nothing but a species of sensation" (T, 103). This should not be surprising, given that belief is "so essential to the subsistence of all human creatures." "It is more conformable to the ordinary wisdom of nature to secure so necessary an act of the mind, by some instinct or mechanical tendency" than to trust it "to the fallacious deductions of our reason" (EHU, 55). Hume's "sceptical solution" thus gives a descriptive alternative, appropriately "independent of all the laboured deductions of the understanding," to philosophers' attempts to account for our causal "reasonings" by appeal to reason and argument. For the other notions in the definitional circle, "either we have no idea of force or energy, and these words are altogether insignificant, or they can mean nothing but that determination of the thought, acquir'd by habit, to pass from the cause to its usual effect" (T, 657).

Necessary Connection and the Definition of Cause

It remains only for Hume to "confirm and illustrate" his positive account by providing a precise definition of our idea of causation. In doing so, he accounts in his own terms for the *necessary connection* so many philosophers have taken to be an essential component of the idea of causation.

As we should expect from the preceding discussion, when we examine a single case of two events we regard as causally related, our impressions are only of their *conjunction*; the single case, taken by itself, yields no notion of their *connection. W*hen we go beyond the single case to examine the background of experienced constant conjunctions of similar pairs of events, we find little to add, for "there is nothing in a number of instances, different from every single instance, which is supposed to be exactly similar" (EHU, 75). How can the mere repetition of *conjunctions* produce a *connection*?

While there is indeed nothing added to our *external* senses by this exercise, something does happen: "after a repetition of similar instances, the mind is carried by habit, upon the appearance of one event, to expect its usual attendant, and to believe that it will exist." We *feel* this transition as an impression of *reflection*, or i*nternal sensation*, and it is *this feeling of determination* that is "the sentiment or impression from which we form the idea of power or necessary connexion. Nothing farther is in the case" (EHU, 75).

Although the impression of reflection -- the internal sensation -- is the source of our idea of the connection, that experience wouldn't have occurred if we hadn't had the requisite impressions of sensation -- the external impressions -- of the current situation, together with the background of memories of our past impressions of relevant similar instances.

All the impressions involved are relevant to a complete account of the origin of the idea, even though they seem, strictly speaking, to be "drawn from objects foreign to the cause."
Hume sums up all of the relevant impressions in not one but two definitions of *cause*.

The relation -- or the lack of it -- between these definitions has been a matter of considerable controversy. If we follow his account of definition, however, the first definition, which defines a cause as "*an object, followed by another, and where all objects similar to the first are followed by objects similar to the second*" (EHU, 76), accounts for all the external impressions involved in the case. His second definition, which defines a cause as "*an object followed by another, and whose appearance always conveys the thought to that other*" (EHU, 77) captures the internal sensation -- the feeling of determination -- involved. *Both* are definitions, by Hume's account, but the "just definition" of *cause* he claims to provide is expressed only by the conjunction of the two: only together do the definitions capture all the relevant impressions involved.

Hume's account of causation provides a paradigm of how philosophy, as he conceives it, should be done. He goes on to apply his method to other thorny traditional problems of philosophy and theology: liberty and necessity, miracles, design. In each case, the moral is that *a priori* reasoning and argument gets us nowhere: "it is only experience which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another. Such is the foundation of moral reasoning, which forms the greater part of human knowledge, and is the source of all human action and behaviour" (EHU, 164). Since we all have limited experience, our conclusions should always be tentative, modest, reserved, cautious. This conservative, fallibilist position, which Hume calls *mitigated scepticism*, is the proper epistemic attitude for anyone "sensible of the strange infirmities of human understanding" (EHU, 161).

Moral Philosophy

The cautious attitude Hume recommends is noticeably absent in moral philosophy, where "systems and hypotheses" have also "perverted our natural understanding," the most prominent being the views of the moral rationalists -- Samuel Clarke, Locke, and William Wollaston, the theories of "the selfish schools" -- Hobbes and Mandeville -- and the pernicious theological ethics of "the schools," whose promotion of the dismal "monkish virtues" frame a catalogue of virtues diametrically opposed to Hume's. Although he offers arguments against the "systems" he opposes, Hume thinks the strongest case against them is to be made descriptively: all these theories offer accounts of human nature that experience and observation prove false.

Against the moral rationalists -- the intellectualists of moral philosophy -- who hold that moral judgments are based on reason, Hume maintains that it is difficult even to make their hypothesis intelligible (T, 455-470; EPM, Appendix I). Reason, Hume argues, judges either of matters of fact or of relations. Morality never consists in any single matter of fact that could be immediately perceived, intuited, or grasped by reason alone; morality for rationalists must therefore involve the perception of relations. But inanimate objects and animals can bear the same relations to one another that humans can, though we don't draw the same moral conclusions from determining that objects or animals are in a given relation as we do when humans are in that same relation. Distinguishing these cases requires more than reason alone can provide. Even if we could determine an appropriate subject-matter for the moral rationalist, it would still be the case that, after determining that a matter of fact or a relation obtains, the understanding has no more room

to operate, so the praise or blame that follows can't be the work of reason.

Reason, Hume maintains, can at most inform us of the tendencies of actions. It can recommend means for attaining a given end, but it can't recommend ultimate ends. Reason can provide no motive to action, for reason alone is insufficient to produce moral blame or approbation. We need sentiment to give a preference to the useful tendencies of actions.

Finally, the moral rationalists' account of justice fares no better. Justice can't be determined by examining a single case, since the advantage to society of a rule of justice depends on how it works in general under the circumstances in which it is introduced.

Thus the views of the moral rationalists on the role of reason in ethics, even if they can be made coherent, are false.

Hume then turns to the claims of "the selfish schools," that morality is either altogether illusory (Mandeville) or can be reduced to considerations of self-interest (Hobbes). He argues that an accurate description of the social virtues, benevolence and justice, will show that their views are false.

There has been much discussion over the differences between Hume's presentation of these arguments in the *Treatise* and the second *Enquiry*. "Sympathy" is the key term in the *Treatise*, while *benevolence* does the work in the *Enquiry*. But this need not reflect any substantial shift in doctrine. If we look closely, we see that benevolence plays much the same functional role in the *Enquiry* that sympathy plays in the *Treatise*. Hume sometimes describes benevolence as a manifestation of our "natural" or "social sympathy." In both texts, Hume's central point is that we experience this "feeling for humanity" in ourselves and observe it in others, so "the selfish hypothesis" is "contrary both to common feeling and to our most unprejudiced notions" (EPM, 298).

Borrowing from Butler and Hutcheson, Hume argues that, however prominent considerations of self-interest may be, we do find cases where, when self-interest is not at stake, we respond with benevolence, not indifference. We approve of benevolence in others, even when their benevolence is not, and never will be, directed toward us. We even observe benevolence in animals. Haggling over how much benevolence is found in human nature is pointless; that there is any benevolence at all refutes the selfish hypothesis.

Against Hobbes, Hume argues that our benevolent sentiments can't be reduced to self-interest. It is true that, when we desire the happiness of others, and try to make them happy, we may enjoy doing so. But benevolence is necessary for our self-enjoyment, and although we may act from the combined motives of benevolence and enjoyment, our benevolent sentiments aren't identical with our self-enjoyment.

We approve of benevolence in large part because it is useful. Benevolent acts tend to promote social welfare, and those who are benevolent are motivated to cultivate the other social virtue, justice. But while benevolence is an original principle in human nature, justice is not. Our need for rules of justice isn't

universal; it arises only under conditions of relative scarcity, where property must be regulated to preserve order in society.

The need for rules of justice is also a function of a society's size. In very small societies, where the members are more of an extended family, there may be no need for rules of *justice*, because there is no need for regulating *property* -- no need, indeed, for *our* notion of property at all. Only when society becomes extensive enough that it is impossible for everyone in it to be part of one's "narrow circle" does the need for rules of justice arise.

The rules of justice in a given society are "the product of artifice and contrivance." They are constructed by the society to solve the problem of how to regulate property; other rules might do just as well. The real need is for some set of "general inflexible rules...adopted as best to serve public utility" (EPM, 305).

Hobbesians try to reduce justice to self-interest, because everyone recognizes that it is in their interest that there be rules regulating property. But even here, the benefits for each individual result from the whole scheme or system being in place, not from the fact that each just act benefits each individual directly. As with benevolence, Hume argues that we approve of the system itself even where our self-interest isn't at stake. We can see this not only from cases in our own society, but also when we consider societies distant in space and time.

Hume's social virtues are related. Sentiments of benevolence draw us to society, allow us to perceive its advantages, provide a source of approval for just acts, and motivate us to do just acts ourselves. We approve of both virtues because we recognize their role in promoting the happiness and prosperity of society. Their functional roles are, nonetheless, distinct. Hume compares the benefits of benevolence to "a wall, built by many hands, which still rises by every stone that is heaped upon it, and receives increase proportional to the diligence and care of each workman," while the happiness justice produces is like the results of building "a vault, where each individual stone would, of itself, fall to the ground" (EPM, 305).

"Daily observation" confirms that we recognize and approve of the utility of acts of benevolence and justice. While much of the agreeableness of the utility we find in these acts may be due to the fact that they promote our self-interest, it is also true that, in approving of useful acts, we don't restrict ourselves to those that serve our particular interests. Similarly, our private interests often differ from the public interest, but, despite our sentiments in favor of our self-interest, we often also retain our sentiment in favor of the public interest. Where these interests concur, we observe a sensible increase of the sentiment, so it must be the case that the interests of society are not entirely indifferent to us.

With that final nail in Hobbes' coffin, Hume turns to develop his account of the sources of morality. Though we often approve or disapprove of the actions of those remote from us in space and time, it is nonetheless true that, in considering the acts of (say) an Athenian statesman, the good he produced "affects us with a less lively sympathy," even though we judge their "merit to be equally great" as the similar acts of our contemporaries. In such cases our judgment "corrects the inequalities of our internal emotions and perceptions; in like manner, as it preserves us from error, in the several variations of

images, presented to our external senses" (EPM, 227). Adjustment and correction is necessary in both cases if we are to think and talk consistently and coherently.

"The intercourse of sentiments" that conversation produces is the vehicle for these adjustments, for it takes us out of our own peculiar positions. We begin to employ general language which, since it is formed for general use, "must be moulded on some general views ... ." In so doing, we take up a "general" or "common point of view," detached from our self-interested perspectives, to form "some general unalterable standard, by which we may approve or disapprove of characters and manners." We begin to "speak another language" -- the language of morals, which "implies some sentiment common to all mankind, which recommends the same object to general approbation, and makes every man, or most men, agree in the same opinion or decision concerning it. It also implies some sentiment, so universal and comprehensive as to extend to all mankind, and render the actions and conduct, even of the persons the most remote, an object of applause or censure, according as they agree or disagree with that rule of right which is established. These two requisite circumstances belong alone to the sentiment of humanity here insisted on" (EPM, 272). It is the *extended* or *extensive* sentiment of humanity -- benevolence or sympathy -- that for Hume is ultimately "the foundation of morals."

But even if the *social* virtues move us from a perspective of self-interest to one more universal and extensive, it might appear that the *individual* virtues do not. But since these virtues also receive our approbation because of their usefulness, and since "these advantages are enjoyed by the person possessed of the character, it can never be self-love which renders the prospect of them agreeable to us, the spectators, and prompts our esteem and approbation" (EPM, 234).

Just as we make judgments about others, we are aware, from infancy, that others make judgments about us. We desire their approval and modify our behavior in response to their judgments. This *love of fame* gives rise to the habit of reflectively evaluating our own actions and character traits. We first see ourselves as others see us, but eventually we develop our own standards of evaluation, keeping "alive all the sentiments of right and wrong," which "begats, in noble natures, a certain reverence" for ourselves as well as others, "which is the surest guardian of every virtue" (EPM, 276). The general character of moral language, produced and promoted by our social sympathies, permits us to judge ourselves and others from the general point of view, the proper perspective of morality. For Hume, that is "...the most perfect morality with which we are acquainted" (EPM, 276).

Hume summarizes his account in this definition of *virtue*, or *Personal Merit*: "every quality of the mind, which is *useful* or *agreeable* to the *person himself* or to *others,* communicates a pleasure to the spectator, engages his esteem, and is admitted under the honourable denomination of virtue or merit" (EPM, 277). That is, as observers -- of ourselves as well as others -- to the extent that we regard certain acts as manifestations of certain character traits, we consider the usual tendencies of acts done from those traits, and find them useful or agreeable, to the agent or to others, and approve or disapprove of them accordingly. A striking feature of this definition is its precise parallel to the two definitions of *cause* that Hume gave as the conclusion of his central argument in the first *Enquiry*. Both definitions pick out features of events, and both record a spectator's reaction or response to those events.

Politics, Criticism, History, and Religion

Hume's "Advertisement" for the first two books of the *Treatise* promised subsequent works on morals, politics and criticism, but his *Political Discourses*, "Of Tragedy," and "Of the Standard of Taste" are our only hints as to what he might have said about those topics.

Hume's political essays range widely, covering not only the constitutional issues one might expect, but also venturing into what we now call economics, dealing with issues of commerce, luxury, and their implications for society. His treatments of these scattered topics exhibit a unity of purpose and method that makes the essays much more than the sum of their parts, and links them, not only with his more narrowly philosophical concerns, but also with his earlier moral and literary essays.

Adopting a causal, descriptive approach to the problems he discusses, Hume stresses that current events and concerns are best understood by tracing them historically to their origins. This approach contrasts sharply with contemporary discussions, which treated these events as the products of chance, or -- worse -- of providence. Hume substitutes a concern for the "moral causes" -- the human choices and actions -- of the events, conditions, or institutions he considers. This thoroughly secular approach is accentuated by his willingness to point out the bad effects of superstition and enthusiasm on society, government, and political and social life.

"Of the Standard of Taste" is a rich contribution to the then-emerging discipline of what we now call *aesthetics*. This complex essay contains a lucid statement of Hume's views on what constitutes "just criticism," but it is not *just* about criticism, as some readers are beginning to realize. Though Hume's account of aesthetic judgment precisely parallels his account of causal and moral judgment, the essay also contains a discussion of how a naturalistic theory might deal with questions of normativity, and so is important, not just as a significant contribution to Hume's overall view, but also for its immediate relevance for problems in contemporary empirical naturalism.

Hume's *History of England*, published in six volumes over as many years in the 1750s, recalls his characterization, in the first *Enquiry*, of history as "so many collections of experiments." Hume not surprisingly rejects the theoretical commitments of both Tory and Whig accounts of British history, and offers what he believes is an impartial account that looks at political institutions as historical developments responsive to Britons' experience of changing conditions, evaluating political decisions in the contexts in which they were made, instead of second-guessing them in the light of subsequent developments.

The Natural History of Religion is also a *history* in a sense, though it has been described as "philosophical" or "conjectural" history. It is an account of the origins and development of religious beliefs, with the thinly-disguised agenda of making clear not only the nonrational origins of religion, but also of exposing and describing the pathology of its current forms. Religion began in the postulation, by primitive peoples, of "invisible intelligences" to account for frightening, uncontrollable natural phenomena, such as disease and earthquakes. In its original forms, it was polytheistic, which Hume

regards as relatively harmless because of its tolerance of diversity. But polytheism eventually gives way to monotheism, when the followers of one deity hold sway over the others. Monotheism is dogmatic and intolerant; worse, it gives rise to theological systems which spread absurdity and intolerance, but which use reason to corrupt philosophical thought. But since religion is not universal in the way that our nonrational beliefs in causation or physical objects are, perhaps it can eventually be dislodged from human thinking altogether.

Hume's *Natural History* cemented his reputation as a religious sceptic and an atheist, even before its publication. Prompted by his own prudence, as well as the pleas of his friends, he resisted publishing the *Dialogues concerning Natural Religion*, which he had worked on since the early 1750s, though he continued revising the manuscript until his death. An expansion and dramatic revision of the argument previewed in Section XI of the first *Enquiry*, the *Dialogues* are so riddled with irony that controversy still rages as to what character, if any, speaks for Hume. But his devastating critique of the argument from design leaves no doubt that -- scholarly details about its enigmatic final section aside -- the conclusions philosophers and theologians have drawn from that argument go far beyond any evidence the argument itself provides.

A fitting conclusion to a philosophical life, the posthumously published *Dialogues* would alone insure the philosophical and literary immortality of their author. In this magnificent work, Hume demonstrates his mastery of the dialogue form, while producing *the* preeminent work in the philosophy of religion.

Bibliography

Hume's Works

The abbreviations and texts cited above are as follows:

[T] *A Treatise of Human Nature*, edited by L. A. Selby-Bigge, 2nd ed. revised by P.H. Nidditch, Oxford: Clarendon Press, 1975. [Page references above are to this edition.]

A Treatise of Human Nature, edited by David Fate Norton and Mary J. Norton, Oxford/New York: Oxford University Press, 2000

[EHU] *Enquiry concerning Human Understanding*, in *Enquiries concerning Human Understanding and concerning the Principles of Morals*, edited by L. A. Selby-Bigge, 3rd edition revised by P. H. Nidditch, Oxford: Clarendon Press, 1975. [Page references above are to this edition.]

An Enquiry concerning Human Understanding, edited by Tom L. Beauchamp, Oxford/New York: Oxford University Press, 1999

[EPM] *Enquiry concerning the Principles of Morals*, edited by L. A. Selby-Bigge, 3rd edition revised by P. H. Nidditch, Oxford: Clarendon Press, 1975. [Page references above are to this edition.]

Enquiry concerning the Principles of Morals, edited by Tom L. Beauchamp, Oxford/New York: Oxford University Press, 1998

[HL] *The Letters of David Hume*, edited by J.Y.T. Greig, 2 volumes, Oxford: Clarendon Press, 1932. [This edition also contains Hume's autobiographical essay, "My Own Life" (HL, I:1-7).]

Other works by Hume and editions of Hume's writings are:

- *Dialogues concerning Natural Religion*, edited by Norman Kemp Smith, Oxford: Oxford University Press, 1935
- *The Natural History of Religion*, edited by H. E. Root, Stanford: Stanford University Press, 1967
- *Essays, Moral, Political, Literary*, edited by Eugene F. Miller, Indianapolis: Liberty Classics, 1985
- *The History of England*, edited by William B. Todd, Indianapolis: Liberty Classics, 1983

In addition to the letters found in [HL], Hume's correspondence may be found in:

- *New Letters of David Hume*, edited by Raymond Klibansky and Ernest C. Mossner, Oxford: Clarendon Press, 1954

Finally, the closest thing at present to a complete edition remains that of Green and Grose:

- *The Philosophical Works of David Hume*, edited by T. H. Green and T. H. Grose. 4 volumes, London: Longman, Green, 1874-75

Bibliographical Studies

A useful bibliography of work on Hume is:

- Hall, Roland. *Fifty Years of Hume Scholarship: A Bibliographical Guide*, Edinburgh: Edinburgh University Press, 1978
- Hall also prepared annual bibliographies of the Hume literature for *Hume Studies*, a journal specializing in work on Hume, for the years 1977-1986; these bibliographies appeared in the November issues of that journal from 1978 to 1988
- *Hume Studies* revived the practice of including bibliographies with its November 1994 issue, which contained a comprehensive bibliography of the Hume literature from 1986-1993 by William Edward Morris. Subsequent volumes contain annual supplements to this bibiliography, also by Morris

Miracles

Aquinas (*Summa Contra Gentiles*, III) says "those things are properly called miracles which are done by divine agency beyond the order commonly observed in nature *(praeter ordinem communiter observatum in rebus*)." A miracle, philosophically speaking, is never a mere coincidence no matter how extraordinary or significant. (If you miss a plane and the plane crashes, that is not a miracle unless God intervened in the natural course of events causing you to miss the flight.) A miracle is a supernaturally (divinely) caused event - an event (ordinarily) different from what would have occurred in the normal ("natural") course of events. It is a divine overriding of, or interference with, the natural order. As such, it need not be extraordinary, marvelous or significant, and it must be something other than a coincidence, no matter how remarkable - unless the "coincidence" itself is caused by divine intervention (i.e., not really a coincidence at all). Miracles, however, are ordinarily understood to be not just products of divine intervention in the natural order, but extraordinary, marvelous and significant as well. Thus, Aquinas says a miracle is "beyond the order commonly observed;" and Dr. Eric Mascall says that the word "miracle" "signifies in Christian theology a striking interposition of divine power by which the operations of the ordinary course of nature are overruled, suspended, or modified" (*Chamber's Encyclopaedia*).

The *locus classicus* for modern and contemporary philosophical discussion of miracles is Chapter X ("*Of Miracles*") of David Hume's *Enquiries Concerning Human Understanding*, first published in 1748. He says "A miracle may accurately be defined, a transgression of a law of nature by a particular volition of the deity, or by the interposition of some invisible agent" (*Enquiries*, p. 115n). His slightly different definition of a miracle as "a violation of the laws of nature" appears to be central to his argument against justified belief in miracles. "A miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined" (*Enquiries*, p. 114).

Miracles and Laws of Nature

Hume's argument against justified belief in miracles, as well as much subsequent discussion, appears to depend heavily upon the premise that "a miracle is a violation of the laws of nature." However, the actual role such a premise plays in Hume's argument, and whether Hume meant to define a miracle as a violation of a law of nature, or merely to characterise a miracle as, in some epistemologically relevant sense, "contrary" to the ordinary course of nature is controversial. It is clear, however, that on most commonsense, philosophical, *or* "scientific" accounts of what a law of nature is, technically speaking miracles are not violations of such laws but instead are positive instances of those laws. This is because laws of nature do not, and are not meant to, account for or describe events with supernatural causes - but only those with natural causes. Once some event is assumed to have a supernatural cause it is, by that very fact, outside the scope of laws of nature altogether and so cannot violate them. Only if one disregards the possibility of supernatural causes can known exceptions to laws possibly be regarded as violations of laws. However, in such a case there might be better reason to suppose that the exception simply shows that what was taken to be a law is not really a law, rather than that the exception is a violation of a genuine law of nature.

If the explanation I offer of Hume's argument against justified belief in miracles is correct (see the section below "Hume's Argument Against Justified Belief In Miracles"), then the premise that "a miracle is a violation of a law of nature" plays no significant role in his argument. The premise is a gloss for the underlying supposition that one cannot have an "impression" of a supernatural event. Because no such impression can be had, any allegedly miraculous event, simply because it is allegedly miraculous, cannot *ex hypothesis* be judged relevantly similar to any other event in experience. And *any* event that cannot be judged relevantly similar to others in our collective experience, cannot justifiably be believed to have occurred in accordance with Hume's principles of *a posteriori* reasoning. (Nor, can one justifiably believe that such an event will occur with any degree of probability whatsoever.) Before examining Hume's argument it is worth examining in detail the view that a miracle is a violation of a law of nature - an issue that far too much has been written about.

Hume is the pre-eminent proponent of the "regularity theory of causation." In characterizing regularity theories of causation, Tom Beauchamp (1974: 36) says,

> The modern claim is that universality and not objective necessity is that which is central to the concept of cause and also that which is implicit in any use *of* causal terminology. The philosophical problem of causation has thus largely come to be interpreted in this regularity tradition as the problem of the proper analysis of causal laws. Regularity exponents analyze laws as true, contingent, universal generalizations which are omnispatially and omnitemporally unrestricted in scope. Purported necessary connections between the antecedent and consequent events described in the law are regarded as gratuitous.

In fact, Beauchamp's view of the "modern claim" is problematic and the problem concerning a proper analysis of causal laws has not been resolved. But let us suppose that on Hume's view the conditions Beauchamp cites are sufficient for a statement to be a law of nature. That is: A statement L is a law of nature only if (i) L is contingent, (ii) L is general, and (iii) L is true. Given these constraints, consider the following two questions.

(1) Is there a law such that there might have been an event contrary to it?
(2) Can there be a law L that is violated while a law?

Given the above criteria for laws of nature, the answer to question 2 is "no." If an event occurred that fell within the scope of the laws of nature (i.e. was covered by those laws), but conflicted with the statement of the law, then either L would not be true, or else L would not be "general" - and therefore not a law of nature. The statement that the event occurred would be logically incompatible with the statement of the law of nature. Specifically it would be incompatible with the law whose status as a "law" is undermined because its truth or generality requirements are not met. If the event occurred, and we could know that it occurred and was "natural" (i.e. *within the scope of the law),* then we could no longer accept L as a genuine law. If laws of nature were descriptive of the scope and substance of everything that could logically happen, instead of their scope being limited to what can happen naturally (i.e., apart from supernatural interference), then of course miracles would not be possible. But that which is "physically impossible" - impossible within the constraints of the laws of nature - has a narrower scope than that which is logically possible. Apart from an argument to the contrary one need not assume that the logically and physically impossible are coextensive. To regard an event a natural is to regard it as falling within the scope of laws of nature, and anything that is covered by laws of nature cannot, *ex hypothesis*, violate them. Suppose an event assumed to be natural occurred, it really was natural and one could know that it did violate some alleged law of nature - no mistake was being made. Then this would show that the law it allegedly violated was in need of revision and was therefore not a genuine law at all.

However, suppose the laws of nature are regarded as non-universal or incomplete in the sense that while they cover natural events, they do not cover, and are not intended to cover, nonnatural events such as supernaturally caused events if there are or could be any. Then there is no contradiction in supposing that a physically impossible event could occur. A physically impossible occurrence would not violate a law of nature because it would not be covered by (i.e., within the scope of) such a law. So while the answer to question 2 is "no," this does not rule out the possibility of supernatural interference with the natural - perhaps as Robert Young (1972) suggests, as one causal condition among many necessary for an event's occurrence. What it does rule out is understanding this interference as a violation of the laws of nature in a technical sense. But this does not undermine the possibility of a miracle since the crucial element in the notion of a miracle - a "a supernatural interference with the natural order" - is not ruled out in showing that a miracle cannot really (strictly) be a violation of a law of nature.

If a miracle is not a violation of a law of nature, then how is it to be defined in relation to laws of nature? Question 1 above suggests a solution. A miracle can be defined as an event *contrary* to, but not a *violation* of, a law of nature. If "violation" is not being used in a technical sense, then a miracle can still be described as a violation of a law of nature - where "violation" would mean something like "contrary to

what could have happened had nature been the only force operative. " An event may be contrary to a law of nature without thereby invalidating it if it is caused by nonnatural forces - or in epistemic terms, if its occurrence can only be correctly explained in terms of nonnatural forces. A positive answer to question 1 follows from the fact that laws of nature do not describe, nor are they intended to describe, the logically possible. They only describe the physically possible. There is also a sense in which the positive answer to question 1 follows from the contingency of laws of nature. But his is not the sense that interests us. Even if the laws of nature were logically necessary, there could be events contrary to those laws if it is assumed that the scope of those laws is limited.

A violation of a law of nature by natural means is what one wants, normatively, to hold as a contradiction in terms - assuming insistence on generality (i.e., nonlocal empirical terms) in the statement of the law. One does not want to hold the occurrence of an event contrary to a law of nature due to nonnatural means as a contradiction in terms - at least not on the basis of an analysis of laws of nature. To hold this position, an analysis of laws would have to be combined with an argument against the possibility of nonnaturally caused events. (This is more or less what occurs in Hume's argument. Hume's empiricism and his theory of meaning are the basis of at least an implicit argument, employed by Hume, against the possibility of the supernatural in his discussion of miracles.) To say that miracles are impossible *because* violations of laws of nature are impossible is to improperly assume either (1) that a miracle must involve a violation of a law; or (2) that nothing contrary to a law of nature can occur because laws of nature circumscribe the logically possible and not merely the physically possible. But apart from distinct arguments to the contrary neither assumption appears to be warranted - at least not *prima facie* warranted.

To say, "an event is physically impossible and a violation of laws of nature if a statement of its occurrence is logically incompatible with a statement of the laws of nature," and *then* to assume that laws of nature circumscribe that which is logically, and not merely physically, impossible is to rule out the occurrence of the physically impossible on ill-conceived logical grounds. It is to deal with the possibility of miracles in the most superficial of ways by defining them out of existence using either an indefensible concept of a law of nature, or supposing a suppressed argument against the possibility of nonnatural interference.

A law of nature cannot be violated by natural forces. It can only be undermined as a genuine law. This happens if something natural occurs that the law was supposed to account but in fact could not. But neither can a law of nature be violated by a nonnatural force. Nor can it be undermined, assuming we can distinguish natural from nonnatural occurrences. A law of nature is, whatever else it may be, a true description of both the physically and logically possible occurrences within its scope, in the actual world *only* if it is assumed that no nonnatural forces could exist or interfere. Otherwise, a law describes only what can happen as a matter of physical possibility. Its presupposed scope is limited to what can happen given only natural forces. It allows for the possibility that the physically impossible remains logically possible, assuming the possibility of nonnatural forces capable of interaction in the actual world. Thus, nonnatural interventions are not, strictly speaking, violations of laws of nature. An intervention is, however, physically impossible, because (or so long as) that which is physically possible is defined in terms of the scope of laws of nature. An interference that is outside the scope of the laws of nature does

not violate any laws of nature by doing that which is physically impossible - that is - in doing that which is not possible given only natural forces.

Regularity theorists sometimes say that causal statements entail implicit or explicit reference to causal laws (e.g. laws of nature) and are instances of those laws. This appears to be false, or at least suspect, for a variety of different types of singular causal statements, including those in which a sufficient condition of X causing Y is dependent upon some subjective (nonphysical) factor. "The joke I was told caused me to ..." would not ordinarily be thought of as referring, either explicitly or implicitly, to a law of nature, or a general causal law, unless one were a strict determinist or maintained a strong form of a "covering law model" as essential to all forms of explanation. Even if there are some psychophysical laws, it is counterintuitive to argue that the *meaning* of causal statements, like the one above, implies a causal generalization. (Similarly, even if there are covering-law models that imply historical explanation is generalizable, it does not seem to be part of the *meaning* of historical explanation in causal form that it be generalizable.) Even supposing that the causal statement has counterfactual force (e.g. "If I had not been told the joke I would not have . . ."), one would not intuitively argue that this statement is an instance of a causal generalization by virtue of its meaning.

Leaving these controversial cases aside, a statement that a miracle occurred, usually - as in the case of many of the biblical miracles - refers to God as causing something that is not the sort of occurrence that one would expect to be explainable in terms of laws of nature, if it could be explained at all. I am here supposing supernatural explanation to be a viable alternative and the one that might plausibly be chosen in a case like the Red Sea parting as depicted in the movie "The Ten Commandments" (i.e., not simply a low tide). If causal statements did require reference to laws of nature, then this would appear to rule out the possibility of miracles since a miracle refers to a type of causal statement whose nature rules out reference to laws of nature taken as generalized cases of which they are instances. (John Locke (1706) denies that miracles are not instances of laws. They are not, however, instances of laws of nature according to Locke. He thinks that to say they are not instances of any laws whatsoever (e.g. not even of supernatural laws) is to say that they are random occurrences, and he thinks that this is absurd.) Miracles are contrary to laws of nature, *not* "violations" of them and *not* instances of them. (Actually, miracles are *vacuous* instances of true laws of nature as I explain below.) Note that it is not simply a miracle's *uniqueness* that rules out such reference to laws of nature. It cannot be uniqueness since even miracles that are supposed to be repeatable, such as raising one from the dead, cannot in principle refer to laws of nature for a complete explanation of their occurrence. Presumably they must also refer to divine intervention.

A miracle's uniqueness presents only a *preface* difficulty for supposing miracles to be supernaturally "caused." It is not difficult to show that causal terminology is applicable to statements about miracles. A regularity theory should be understood as requiring reference to laws of nature only when the causal statement is about natural events. More generally, a regularity theory requires reference to causal generalizations, but not necessarily to generalizations in terms of laws of nature. There is no reason to suppose that a miracle's uniqueness, if it is unique, cannot or does not carry with it implicit reference to a causal generalization. The counterfactual force that is constitutive of the meaning of some causal statements that specify necessary and sufficient material conditions for some event to occur may indicate

the presence of an implicit generalization in the causal statement about a miracle. Generally, if we say "X caused Y" we mean, in part, that if X had not occurred, then Y would not have occurred in the circumstances. But also implicit in the meaning of this is that if X occurred again, in relevantly similar circumstances, then Y would also occur again. To say that God caused X is to say that X would not have come about apart from God's activity and also that X would again come about if God acted similarly in a relevantly similar situation. If there is a supernature, then it is reasonable to suppose, as Locke did, that there are "laws of supernature" and that singular causal statements concerning the supernatural may be understood as implicitly assuming the generalizability of such singular causal statements in terms of those laws.

Consider the following objection to the characterization of a miracle as being contrary to a law of nature and outside its scope. Suppose, as I have, that true laws of nature do not have the form:

> (1) Whenever an event of type C occurs, an event of type E occurs.

Assume instead that they are of the form:

> (2) If an event of type C occurs, and there is no supernatural intervention, then an event of type E occurs.

Or, schematically:

> (3) (C & N) → E

Now consider a case where an event of type C occurs, there *is* supernatural intervention, and no event of type E occurs. From the truth table of the conditional function it follows that this case will be a positive instance of a true law, where such laws are of the form (C & N) → E. ("P → Q" will be true if the first component is false or if the second component is true. In the case under consideration, the first component will be false if "N" is false - this is, if there is supernatural intervention as hypothesized.) Thus, a miracle is not contrary to, or a violation of, a law of nature, and it is not outside the scope of such a law.

My response to this objection is as follows. I agree that the case considered above (i.e., a miraculous event occurs due to supernatural intervention) is a positive instance of a true law of nature where such laws are schematically of the form (C & N) → E. Miracles do not violate true laws of nature because such laws contain the supposition, either explicit or implicit, that laws describe what will happen given the presence of only natural forces. However, once there is supernatural interference, then no matter what follows C (whether or not E occurs), (C & N) → E will be trivially true just because N is false. (It would be true even if C is false.)

While it is true that a miraculous occurrence would be a positive instance of a true law, because true laws of the form (C & N) → E are never false if N is false (N is false if there is supernatural interference), I

want to call attention to the fact that while miracles do not violate true laws (i.e., they are positive instances of them), they should not be thought of as "within the scope of the laws of nature." This is because laws of nature are meant to account for, or describe, what occurs and what could possibly occur only apart from supernatural intervention. Laws describe what is naturally or physically possible. Because a positive instance of a true law of nature will be trivially true in cases of ~N, it will not explain why E does not occur even though C does occur. It is the assertion of ~N that does the explaining. Whether or not C occurred, or E occurs, (C & N) → E will be true when N is false. But if N is false (i.e., if there is supernatural interference), then the law of nature will not be able to explain either E or ~E in terms of natural forces. Yet this is what one normally expects a law of nature to do.

By saying that cases of supernatural interference are outside the scope of laws of nature, one is thereby refusing to consider cases of (C & N) → E, when N is false, to be *significant* instantiations of laws of nature, even though they are formally expressible in terms of laws of nature. While laws of nature can, and do, formally account for such cases, there is no explanation of E's nonoccurrence in terms of the natural forces that it is usually assumed to be the concern of laws of nature to describe.

To think of miracles as positive instances of laws of nature is to trivialize what is interesting about them viz. their relationship to laws of nature, where such laws are understood as describing what will and can happen given the presence of only natural forces. Speaking of cases in which there is supernatural intervention as outside the scope of laws of nature is clearly truer to our concept of such laws as descriptive only of those things that occur due to natural forces alone. That is their scope. Therefore, even though miracles can formally be accounted for by laws of nature, materially speaking this inadequate. It is inadequate because this "accounting for" is really done by the supposition of the supernatural interference and not with the miraculous event being a positive instance of the true law (i.e., because ~N results in (C & N) → E being true) as it would in cases where there was no supernatural intervention. Formally, even a positive instance of a true law can be "contrary" to a law of nature of which it is a positive instance. This will be the case in all instances of which an occurrence being a positive instance of a true law is due to supernatural intervention - that is, in all cases which make (C & N) → E trivially true in supposing ~N. This is formally unobjectionable but awkward. In keeping with ordinary usage it is therefore preferable to consider such positive instances of true laws as outside the scope of laws of nature, and to consider only positive instances of laws to be within the scope of laws if (C & N) → E is not true because of the falsity of N.

Hume's Argument Against Justified Belief In Miracles

Remarkably, the discussion of Hume on miracles has not been confined to, or even principally concerned with, whether or not Hume was correct in his argument against justified belief in miracles - and/or the possibility of justified belief in miracles. Instead, philosophical discussion has focused on exegetical issues concerning exactly what Hume was arguing. There is, for example, still no generally accepted view on the fundamental points of whether his argument (Part I of his essay) against the justified belief in

miracles on the basis of testimony is (i) meant as an *a priori* or *a posteriori* argument; (ii) if that argument can be, or is meant to be, generalized to include first-hand experience of an allegedly miraculous event; or indeed, (iii) if his argument, whether regarded as *a priori* or *a posteriori*, is meant to establish that one can never be justified in believing in a miracle on the basis of testimony. Hume does not appear to claim that miracles are impossible - only that justified belief in a miracle on the basis of testimony (may be) impossible. His argument is basically epistemological. There are, however, grounds for supposing that a miracle is not even possible on Hume's account - at least not given his wider empiricist views.

Hume's position on miracles cannot be properly understood apart from his analysis of causation, *a posteriori* reasoning, and indeed the most fundamental element of his empiricism - his analysis of "impressions" and "ideas" (Book I, *A Treatise of Human Nature*, pp. 1-7). In fact, Hume's position on miracles has never been properly understood because its connection to his views on causation has never been adequately examined. There is considerable controversy over what Hume's position actually was - let alone what his argument for that position is. I offer one highly abbreviated interpretation. (For a more complete account of this interpretation see Levine: 1989: 1-52.) The bibliography contains citations to other interpretations completely at odds with this one and with each other.

To understand Hume on miracles the following question must be answered. Why did Hume think that one could justifiably believe that an extraordinary event had occurred, under certain circumstances, but that one could never justifiably believe a miracle had occurred? The proposed interpretation of Hume's analysis of miracles in relation to his analysis of causation and his wider empiricism yields the only plausible answer to this question that I know of. This interpretation also shows why it makes no substantial difference whether we interpret Hume's argument in Part I "Of Miracles" against the possibility of justified belief in testimony to the miraculous as an *a priori* argument or an *a posteriori* argument since the arguments essentially coalesce.

Hume (*Enquiries*, p. 128) gives the following example of an extraordinary event that he thinks could be rendered credible on the basis of testimony.

> ...suppose, all authors, in all languages, agree, that from the first day of January 1600, there was a total darkness over the whole earth for eight days, suppose that the tradition of this extraordinary event is still strong and lively among the people: that all travelers, who return from foreign countries, bring us accounts of the same tradition, without the least variation or contradiction: it is evident, that our present philosophers, instead of doubting the fact, ought to receive it as certain, and ought to search for the causes whence it might be derived. The decay, corruption, and dissolution of nature, is an event rendered probable by so many analogies, that any phenomenon, which seems to have a tendency towards that catastrophe comes within the reach of human testimony, if that testimony be very extensive and uniform.

In this case not only is the testimony to the alleged event very extensive and uniform, but Hume also

thinks it necessary that our past experience does not render the event completely unlikely. He argues that the eight day darkness can be "rendered probable by so many analogies," assuming it is testified to extensively and uniformly. In such a case Hume assumes that the event is natural and that "we ought to search for the causes." Hume compares this with another imaginary case (*Enquiries*, p. 128).

> ...suppose, that all historians who treat of England, should agree, that, on the first of January 1600, Queen Elizabeth died...and that, after being interred a month, she again appeared, resumed the throne, and governed England for three years: I must confess that I should be surprised at the concurrence of so many odd circumstances, but should not have the least inclination to believe so miraculous event.

Since both events are assumed to be equally well testified to, the reason that Hume thinks the former can be judged credible but not the latter is that in the former case the "event is rendered probable by so many analogies." One can object and say that this appears to be nothing more than a subjective judgement on the part of Hume. His experience suggests analogies for the former type of event but not the latter. The eight day darkness "sufficiently resembles" events that Hume has experienced, or believes in on the basis of experience, to warrant belief in the eight day darkness given that the event is extraordinarily well attested to. In the latter case Hume can find no analogies to draw upon from experience. Given the similarity, in relevant respects, of most peoples' experience (i.e., the experience of Scots at the time of Hume), Hume thinks that if people base their judgments on their experience (in accordance with the principles of *a posteriori* reasoning (Levine 1989: 5-12) extrapolated from his analysis of causation) they will agree that the former (extraordinary) event can be judged credible but not the (miraculous) latter. Hume would agree that if an individual's experience were very different from his own in relevant respects, than that individual could justifiably believe many things that he himself could not.

So despite Hume's *a priori* arguments against justified belief in miracles he argues that under certain circumstances the "evidence" may justify belief in the occurrence of an extraordinary event as long as we have experienced events analogous in type. However, an extraordinary event is not necessarily a miraculous one. In the case of extraordinary events that are well attested to and for which we have suitable experiential analogies, Hume thinks that the most we are justified in believing is that the event did occur - not that the event is a miracle. We are to "search for the [natural] causes whence it might be derived." Such cases may even require us to reassess, to some extent, our estimation of what nature is capable of doing on her own, so to speak. Sometimes statements of laws of nature must be reassessed and altered in light of new experience. Also, we must be careful not to extend our judgments as to what to believe or expect of nature to situations in which all of the relevant circumstances are not the same. This requires explanation.

Hume relates the case of the Indian who refused to believe that water turned to ice. According to Hume, the Indian "reasoned justly" on the basis of his past experience. He refused, at first, to believe that water turned to ice, despite the fact that it was well attested to, because the event not only had the Indian's constant and uniform experience to count against it, but also because the event "bore so little analogy" to that experience (*Enquiries*, pp. 11-15). The Indian "reasoned justly" but he extended his judgments about the properties of water to cases where all the circumstances were not the same (i.e., the relevant

circumstance here being temperature). In certain situations in which we hear testimony to extraordinary events we may be in situations similar to that of the Indian. Indeed, according to Hume, if we justifiably believe that an extraordinary event did occur, then we *should* assume that we are in a situation just like that of the Indian. We should assume this because, as I shall show, there are logically compelling reasons why the consistent Humean, in accordance with the principles of *a posteriori* reasoning based on Hume's analysis of causation and his empiricism, can do nothing else. The extraordinary event should be judged "[not] contrary to uniform experience of the course of nature in cases where all the circumstances are the same" *(Enquiries*, p. 114n).

Why should we judge our situation to be like that of the Indian's? Are there logically compelling reasons for doing so? Hume does not explicitly say why, but it must be because our experience has shown us that situations like the Indian's do arise. On the basis of experience, when we are justified in believing in the occurrence of an extraordinary event, we should liken ourselves to the Indian. That is why, in a case like the eight days of darkness, "we ought to search for the **[natural]** causes whence it might be derived." Experience demands it. It seems then, that according to Hume, when an extraordinary event is extraordinarily well attested to we have only two options. One is to accept the testimony and look for the event's natural causes. The other is to reject the testimony on the grounds that the event testified to bears no *significant* analogy to events we have experienced. Hume thinks that testimony, no matter how reliable, *can never* establish the occurrence of a miraculous event, in accordance with the principles of *a posteriori* reasoning - reasoning that is a type of causal reasoning according to Hume. He says (*Enquiries*, pp. 111-112),

> It being a general maxim, that no objects have any discoverable connection together, and that all the inferences, which we can draw from one to another, are founded merely on our experience of their constant and regular conjunction; it is evident that we ought not to make an exception to this maxim in favor of human testimony.... This species of reasoning, perhaps, one may deny to be founded on the relation of cause and effect. I shall not dispute about a word.

Thus, Hume thinks that if we justifiably accept testimony to an extraordinary event, then on the basis of past experience, we must liken ourselves to the Indian and search for natural causes of which we are unaware. This would be for us the equivalent of the Indian moving north to "Muscovy during the winter" (*Enquiries*, p. 114n). (Think about the last astonishing thing you learned that nature could accomplish as a matter of course and you have a basic part of Hume's argument.)

Contrary to Hume one might try to argue as follows:

> Is it inconceivable that we experience events for which no explanation like that suitable for the Indian has been forthcoming? It may be true that in some situations a seemingly naturally inexplicable event was later learned to have natural causes, but it is at least conceivable that there may be other inexplicable events for which no natural causes can be found. If experience can show that we are unable to find natural causes for certain events -

though these events are every bit as well attested to as other events only some of which we have discovered natural causes for - then why must we liken ourselves to the Indian in cases where we justifiably believe in the occurrence of an extraordinary event? Why does experience demand that we either reject belief in the event's occurrence or believe it but posit natural causes for the event? Justified belief does not entail belief in a natural cause. Experientially you have not shown that it does. Moreover, if we had independent reasons for thinking that no cause of some extraordinary event could be found (e g., on the basis of prophecy), then it is conceivable that we could be justified in believing that an extraordinary event occurred without thereby likening ourselves to the Indian. The grounds on which we might reject the supposition of a natural cause could themselves be experiential (e.g., a prophet's track record). It does seem to be the case that we can always posit a natural explanation for an extraordinary event and base that supposition on experience. On the other hand, we may reject such a supposition, not only on the basis of a priori arguments of natural theology, but also on the basis of experience. For example, suppose that an extraordinary event that had some religious significance was prophesied, testimony justified belief in the event's occurrence, the prophet had been right about certain predictions made in the past, and no immediate natural explanation for the event that had the least bit of plausibility was forthcoming. The option of positing a natural explanation remains open, but experience does not necessarily demand that we avail ourselves of that option. Hume thinks that the most that testimony can establish is that an extraordinary event has occurred, not that a miracle has occurred. To support this one must establish the suppressed premise that we can have no good reasons on the basis of experience, for identifying an event as miraculous. Though Hume employs this premise he does not support it, and the example just given suggests a reason for believing the premise to be invalid.

Hume has not specified adequate criteria for determining when an event can be judged suitably analogous to past experience as to warrant belief when adequately testified to. (This is probably because he thought no such criteria could be given - each extraordinary case having to be considered on its own merits.) Experientially, there are no clear cut criteria enabling us to determine, with any degree of assurance, that an eight day darkness is analogous to past experience while a resurrection does not, in the least, bear any resemblance to aspects of our past experience that could make it at least as likely an event to be believed in as the eight day darkness. Could not a resurrection be found analogous to past experience in precisely the same way that an eight day darkness could (i.e., experience of the "decay, corruption, and dissolution of nature")? In the absence of such criteria there is no logically compelling reason, and not even necessarily compelling experiential reasons, for assuming that the extraordinary event occurred (naturally) but a resurrection did not occur (miraculously). If the darkness can be justifiably believed in then so too can a resurrection. Furthermore, under the appropriate circumstances, not only could the resurrection be judged miraculous and not merely extraordinary, but so could the eight day darkness. The thing that would determine whether or not the event was to be judged miraculous would be whether we had reason to believe that God or God's agents caused

> the event - better reasons than for thinking that the event was caused naturally. It is conceivable that a judgment that God caused a particular event can be experientially warranted. Again, imagine a prophet who is known to predict future events accurately. The prophet has a track record of empirically verifiable prophecies concerning events of a most extraordinary nature. Or, imagine a case in which every time a "holy-person" pointed at someone that person lay down dead. An explanation of such goings-on can be sought in terms of natural (e.g., parapsychical) causes and abilities. However, would experience necessitate the acceptance of this explanation over the supernatural one? Hume has not shown that it would.

Hume would reject this argument - and therein lies the entire tale of his argument against justified belief in miracles - whether on the basis of testimony or first-hand experience. He would insist that his principles of reasoning about empirical matters, and his philosophical empiricism (i.e., his theory of "impressions" and "ideas") show that supernatural explanation cannot be justified experientially. In the case of a prophet accurately predicting events, or the "holy-person" pointing their finger and people falling dead, Hume would say that experience justifies us in believing that the event prophesied will come to pass and that if the holy-person lifts their finger in our direction we are justified in running away - and foolish if we do not. But we are not justified in believing such events to be miracles.

We need to ask "What is it about experience, in the sense of expectations about future events or judgments about past events, that could justify the positing of a supernatural cause?" For positing such a cause is necessary if one is to justifiably believe some event to be a miracle. Hume would say that positing such a cause is speculative. It can have no basis in experience. Even if some event really were a miracle, whether it be a resurrection, or "the raising of a feather, when the wind wants ever so little of a force requisite for that purpose" (*Enquiries*, p. 115n), we would not be justified in believing that it was anything more than an extraordinary event. Extraordinary events are at the limits of (our) experience, the supernatural is beyond it. Hume (*Enquiries*, p. 129) says:

> Though the Being to whom the miracle is ascribed, be Almighty, it [the miracle] does not, upon that account, become a whit more probable, since it is impossible for us to know the attributes or actions of such a Being, otherwise than from the experience of his productions, in the usual course of nature. This still reduces us to past observations, and obliges us to compare the instances of the violation of truth in the testimony of men, with those of the violations of the laws of nature by miracles, in order to judge which of them is most likely and probable.

For Hume, a "cause," insofar as it can be used as an item in reasoning from experience, can only be something that we can have an "impression" of. The cause of a miracle would have to be identified as something we could perceive, even if we were to posit some metaphysical "power" of this cause and attribute it speculatively to God. The "cause" of Lazarus's coming forth from the grave would have to be identified with Christ's beckoning - either his voice or some physical gesture - both of which we have "impressions" of and both of which are events "in the usual course of nature."

If a resurrection were well enough attested to that it warranted belief, then that event could still only be assigned status as an extraordinary event with a natural explanation. Hume is thus constrained by his empiricism. He is constrained in such a way that had he been at the shore of the Red Sea with Moses when they were being chased (as in the movie version); and had Moses raised his staff and the Red Sea split up the middle (i.e., no low tide but raging waters on both sides); and had the Red Sea crashed to a close the moment the last Israelite was safe - killing those in pursuit; and had Hume himself lacked grounds for assuming he was hallucinating or perceiving events in any way other than as they were actually happening - Hume would still be constrained by his principles to deny that what he was witnessing was a miracle. This example suffices to show the unacceptability of Hume's argument. Indeed, assuming Hume would have agreed that had he been there with Moses, and had events transpired in a manner suitably similar to the way they are depicted in the film, he would have (readily) agreed that he was justified in believing that a miracle occurred; then his argument against justified belief in miracles can be used as a *reductio ad absurdum*. Flew (1967: 349) is mistaken in his claim that "it be neither arbitrary nor irrational to insist on a definition of a ‘law of nature’ such that the idea of a miracle as an exception to a law of nature is ruled out as self-contradictory."

A resurrection could only be well enough attested to to be justifiably believed if it could be judged as somehow analogous with something in our past experience. If it is, then it must be considered a natural event because, for Hume, anything analogous to our experience is at least analogous in the sense of suggesting that it too has a natural cause. We experience only that which occurs in nature and judgments based on that experience will not warrant positing causes outside of that experience. Suppose that some event actually was supernaturally caused. (Let us suppose Hume recognizes this as a logical possibility in his essay, though I do not think it is given his analysis of causation and his empiricism.) Hume would say that we could not, on the basis of experience, attribute a supernatural cause to the event because we experience only natural causes (i.e., events occurring in the usual course of nature). If an event were supernaturally caused we could legitimately say that we "experienced" some supernatural event, but the sense of experience used here would be an equivocation on Hume's usage This "cause," being transcendent, and not discernible by means of "sense impressions," "internal impressions," or "impressions of reflexion" could not be an item of experience at all as Hume sees it. Thus, because Hume thinks that every cause must be regarded as natural, he is committed to the view that one *could* justifiably believe that an extraordinary event had occurred, but *never* a miracle.

Hume's *a priori* argument against justified belief in miracles actually coalesces with his *a posteriori* argument against such justified belief. On *a posteriori* grounds we could never justifiably believe testimony to the miraculous because we could never judge the occurrence of such an event to be similar, in relevant respects, to anything we have experienced. However, that a miraculous occurrence could never be judged relevantly similar to anything in experience (i.e., that there must be "a firm and unalterable experience" counting against belief in it) is something that we can know *a priori,* since *a priori* we can know that we cannot have an " impression" of a supernatural cause. It follows from this that on *a priori* grounds we can also rule out the possibility of justified belief in testimony to the miraculous.

It follows from what has been said that unless one accepts Hume's analysis of *a posteriori* reasoning as a

type of causal reasoning, and also accepts his analysis of causation, which ultimately rests on his theory of impressions and ideas - a theory that even staunch empiricists should reject as simplistic - then there is no reason to accept *his* argument against the possibility of justified belief in miracles.

Of course, nothing in this critique of Hume's argument should be taken to suggest, in any way, that miracles have ever occurred, or that we are justified in believing that any have occurred. But it would be most surprising if some people at some time and in certain circumstances have not been, and will not again be, justified in believing in the occurrence of a miracle. However, nothing I have said suggests that that the evidence available for the occurrence of any alleged miracle warrants justified belief in miracles for most people - including those who really do believe in them.

Bayesian Analyses of Hume's Argument Concerning Miracles

There are various versions of Bayes's theorem. For example, John Earman (1993:307n4) employs the following:

$$\Pr(H/E\&K) = \frac{\Pr(H/K) \times \Pr(E/H\&K)}{\Pr(E/K)}$$

"The reader is invited to think of *H* as a hypothesis at issue; *K* as the background knowledge; and *E* as the additional evidence. Pr(*H/E&K*) is called the posterior probability of *H*. Pr(*H/K*) and Pr(*E/H&K*) are respectively called the prior probability of *H* and the (posterior) likelihood of *E*."

Bayesian analyses are prominent among the several recent and allegedly novel interpretations of Hume's argument against the justified belief in miracles. However, since there is no consensus on just what Hume's argument is, or exactly what he is trying to establish, it is impossible that any Bayesian analysis, let alone a "Bayesian proof" of that argument, or a recasting of the argument in terms of some version of Bayes's theorem, will not beg crucial issues of interpretation. In so doing, such analyses, in and of themselves, will also beg fundamental epistemological issues concerning, for example, evidence. Furthermore, it is difficult to see how recasting Hume's argument in a Bayesian form can clarify the structure or substance of the argument without presupposing what the argument is.

On the interpretation of Hume's argument given above, a Bayesian analysis sheds no light whatsoever on the structure or substance of the argument, and can do nothing by way of either supporting or refuting the argument. Indeed, any Bayesian analysis of the question of justified belief in miracles must be otiose until the difficult and essential questions concerning "evidence" in relation to an allegedly miraculous occurrence are resolved - at which point any Bayesian analysis will add little except the technical complexity of a formal apparatus that may or may not "clarify" the structure of Hume's argument.

The balancing of probabilities is of no use until it is decided what goes into the balance - that is, what constitutes the evidence that is to be subject to the balancing of probabilities. The point is this; apart from independent philosophical arguments - arguments that would in effect undermine the relevance of a Bayesian analysis to the question of the credibility of reports of the miraculous - no such analysis can, in principle, prove that no testimony can (or cannot) establish the credibility of a miracle. So-called Bayesian analyses of Hume's argument are not analyses of Hume's argument at all - but superfluous representations of it.

Are Miracles Religiously Significant?

Some contemporary theologians have claimed that the issue of miracles has been largely misunderstood and co-opted by philosophers and critics of religion for their own purposes - specifically in order to deny that certain central events the Bible alleges to have occur did occur. Thus, David Strauss (1835) claims that reports of miracles can be rejected "as simply impossible and irreconcilable with the known and universal laws which govern the course of events." Theologians sometimes claim, for example, that there is no word for "miracle," in the Old or New Testament. What are described there as "prodigies" or "wonders" or "effects of powers," are interpreted by philosophers, but not by the Biblical writers, as "miracles." Anthony Flew (1967:347) says that according to Spinoza, as well as some contemporary theologians, "conventional interpreters of the Bible read far more miracles into it than it contains, because they constantly read poetic Hebrew idioms literally." This may be true but it is also inconsequential. No matter how events such as a parting of the sea or a resurrection are described, whether as "wonders" or as "miracles," it is clear that they were understood in Biblical times, as well as in contemporary times, to be in some remarkable sense "contrary to the normal course of nature." People living at the time of Moses or Christ knew just as well as we do that seas do not "normally" part and that people are not, in the normal course of nature, resurrected. What is required for a notion of the miraculous is not some sophisticated notion of what a law of nature is, but just a strong sense of what constitutes the normal, natural course of events. And this is something the ancients had just as much as those living in a scientific age have.

Many people regard the philosophical dimension, the epistemological one in particular, of the issue of miracles as insignificant. Indeed, philosophy of religion, or at least natural theology and the analytic philosophy of religion is regarded as inconsequential by believers as well as some involved in the academic study of religion.

Nevertheless, I think that the philosopher's concerns are more closely allied with those of religious people than, for example, are those of the social scientist. This does not make them more important - just more closely allied. The philosopher is interested in the truth about religious truth-claims and (though many would disagree on philosophical grounds) can pursue that interest more or less independent of dogma, tradition, and what socio-scientific study tells us about the various functions of religion. Philosophical issues in religion are fundamental in a way that other areas of investigation are not. A system of beliefs may serve a variety of functions, personally and socially, but for the religious person these are consequences of the system of beliefs itself. They believe their systems of belief, their religion,

to be more or less coherent and true. It makes a great difference to most believers who are traditional theists whether or not miracles could occur, and whether one could justifiably believe they did occur. One does not have to be a fundamentalist Christian, for example, to believe with Paul that the Christian faith is, in an important sense, a vain pursuit if the central miracles associated with Christianity did not occur. Indeed, one can assume that David Hume, Bertrand Russell and Richard Swinburne would concur. The same point can of course be made, *mutatis mutandis*, for Islam and Judaism or any tradition fundamentally connected to miraculous claims.

Apart from belief in miracles, one is left with a system of beliefs that has had and will continue to have enormous significance - good and bad - for people's lives. However, for the majority of persons for whom these beliefs have that significance, religion could no longer function in the way it does if they became convinced of the falsity of their beliefs. That seems to be verifiable. There is a sense, albeit perhaps not a very important one, in which one is involved in pretense if one practices a system of beliefs whose central tenets one denies. What one is practicing may be similar in significant respects to the religious tradition in question, but one will not be practicing that religion, nor will one properly be regarded as a believer.

Having said that, it should also be said that the issue of miracles is regarded as overly important by contemporary analytic philosophers of religion. Some 19th and 20th century philosophical theologians, as well as those in various disciplines within the academic study of religion, including the philosophy of religion, no longer regard the issue of miracles as central or crucial, either to various religious traditions, to the religious life per se, and definitely not to the more fundamental questions of God and meaning in the traditional domain of philosophical theology. Philosophers of religion, even if sophisticated in terms of their analyses, naively attribute an importance to the issue that may not be altogether warranted.

Probabilistic Causation

"Probabilistic Causation" designates a group of philosophical theories that aim to characterize the relationship between cause and effect using the tools of probability theory. A primary motivation for the development of such theories is the desire for a theory of causation that does not presuppose physical determinism. The central idea behind these theories is that causes raise the probabilities of their effects, all else being equal. As we shall see, a great deal of the work that has been done in this area has been concerned with making the *ceteris paribus* clause more precise. Issues within, and objections to, probabilistic theories of causation will also be discussed.

1. Introduction

According to David Hume, causes are sufficient conditions for their effects: "We may define a cause to be *an object, followed by another, and where all the objects similar to the first, are followed by objects similar to the second.*" (1748, section VII.) Later writers refined Hume's theory, but still characterized the causal relation in terms of necessary and sufficient conditions. One of the best known approaches is Mackie's theory of *inus* conditions. An inus condition for some effect is an insufficient but non-redundant part of an unnecessary but sufficient condition. Suppose, for example, that a lit match causes a forest fire. The lighting of the match, by itself, is not sufficient; many matches are lit without ensuing forest fires. The lit match is, however, a part of some constellation of conditions that are jointly sufficient for the fire. Moreover, given that this set of conditions occurred, rather than some other set sufficient for fire, the lighting of the match was necessary: without it, the fire would not have occurred.

The necessity/sufficiency approach makes causation incompatible with indeterminism: if an event is not

determined to occur, then no event can be a part of a sufficient condition for that event. (An analogous point may be made about necessity.) The recent success of quantum mechanics -- and to a lesser extent, other theories employing probability -- has shaken our faith in determinism. Thus it has struck many philosophers as desirable to develop a theory of causation that does not presuppose determinism. The central idea behind probabilistic theories of causation is that causes *raise the probability* of their effects; an effect may still occur in the absence of a cause or fail to occur in its presence.

Suggested Readings: Hume (1748), especially section VII; Mackie (1974), especially chapter 3.

2. Is Probabilistic Causation an Oxymoron?

Many philosophers find the idea of indeterministic causation counterintuitive. Indeed, the word "causality" is sometimes used as a synonym for determinism. A strong case for indeterministic causation can be made by considering the epistemic warrant for causal claims. There is now very strong empirical evidence that smoking causes lung cancer. Yet the question of whether there is a deterministic relationship between smoking and lung cancer is wide open. The formation of cancer cells depends upon mutation, which is a strong candidate for being an indeterministic process. Moreover, whether an individual smoker develops lung cancer or not depends upon a host of additional factors, such as whether or not she is hit by a bus before cancer cells begin to form. Thus the price of preserving the intuition that causation presupposes determinism is agnosticism about even our best supported causal claims.

Suggested Readings: Suppes (1970) makes the case for a probabilistic theory of causation in his introduction. Humphreys (1989), contains a sensitive treatment of issues involving indeterminism and causation; see especially sections 10 and 11.

3. Main Developments

3.1 The Central Idea

The central idea that causes raise the probability of their effects can be expressed formally using the apparatus of conditional probability. Let A, B, C,... represent entities that potentially stand in causal relations. Depending upon the account, these may be particular events, such as the assassination of Archduke Ferdinand, or event types, such as exposure to ultraviolet radiation. We will discuss this issue at greater length in section 4.3 below. For now we will adopt the generic word "factor" to describe the relevant entities. Let P be a probability function, satisfying the normal rules of the probability calculus, such that P(A) represents the empirical probability that factor A occurs or is instantiated (and likewise for

the other factors). The issue of how empirical probability is to be interpreted will not be addressed here. (See the entry under probability). The probability of B, given A, is represented as a conditional probability:

$$P(B|A) = P(A \& B)/P(A).$$

One natural way of understanding the idea that A raises the probability of B is that $P(B|A) > P(B|\text{not-}A)$. Thus a first attempt at a probabilistic theory of causation would be:

> *PR:* A causes B if and only if $P(B|A) > P(B|\text{not-}A)$.

This formulation is labeled *PR* for "Probability-Raising".

There are two central problems with this theory. The first is that probability-raising is symmetric: if $P(B|A) > P(B|\text{not-}A)$, then $P(A|B) > P(A|\text{not-}B)$. The causal relation, however, is *asymmetric:* if A causes B, then typically B does not cause A. The problem of causal asymmetry arises for virtually every theory of causation, and probabilistic theories of causation are no exception.

The second problem concerns *spurious correlations*. If, for example, A and B are both caused by some third event, say C, then it may be that $P(B|A) > P(B|\text{not-}A)$ even though A does not cause B. For example, let A be an individual's having yellow-stained fingers, and B that individual's having lung cancer. Then we would expect that $P(B|A) > P(B|\text{not-}A)$. The reason that those with yellow-stained fingers are more likely to suffer from lung cancer is that smoking tends to produce both effects. Because individuals with yellow-stained fingers are more likely to be smokers, they are also more likely to suffer from lung cancer. Intuitively, the way to address this problem is to require that causes raise the probabilities of their effects *ceteris paribus.* The history of probabilistic causation is to a large extent a history of attempts to resolve these two central problems.

3.2 Spurious Correlations

Hans Reichenbach introduced the terminology of "screening off" to apply to a particular type of probabilistic relationship. If $P(B|A \& C) = P(B|C)$, then C is said to screen A off from B. Intuitively, C renders A probabilistically irrelevant to B. With this notion in hand, we can attempt to avoid the problem of spurious correlations by adding a 'no screening off' condition to the basic probability-raising condition:

> *NSO:* Factor A occurring at time t, is a cause of the later factor B if and only if:
>
> 1. $P(B|A) > P(B|\text{not-}A)$
> 2. There is no factor C, occurring earlier than or simultaneously with A, that screens A off from B.

We will call this the *NSO*, or 'No Screening Off' formulation. Suppose, as in our example above, that smoking (C) causes both yellow-stained fingers (A) and lung cancer (B). Then smoking will screen yellow-stained fingers off from lung cancer: given that an individual smokes, his yellow-stained fingers have no impact upon his probability of developing lung cancer.

The second condition of *NSO* does not suffice to resolve the problem of spurious correlations, however. This condition was added to eliminate cases where spurious correlations give rise to factors that raise the probability of other factors without causing them. Spurious correlations can also give rise to cases where a cause does not raise the probability of its effect. So genuine causes need not satisfy the *first* condition of *NSO*. Suppose, for example, that smoking is highly correlated with exercise: those who smoke are much more likely to exercise as well. Smoking is a cause of heart disease, but suppose that exercise is an even stronger preventative of heart disease. Then it may be that smokers are, over all, less likely to suffer from heart disease than non-smokers. That is, letting A represent smoking, C exercise, and B heart disease, P(B|A) < P(B|not-A). Note, however, that if we conditionalize on whether one exercises or not, this inequality is reversed: P(B|A & C) > P(B|not-A & C), and P(B|A & not-C) > P(B|not-A & not-C).

The next step is to replace conditions 1 and 2 with the requirement that causes must raise the probability of their effects in *test situations:*

> *TS:* A causes B if P(B|A & T) > P(B|not-A & T) for every test situation T.

A test situation is a conjunction of factors. When such a conjunction of factors is conditioned on, those factors are said to be "held fixed". To specify what the test situations will be, then, we must specify what factors are to be held fixed. In the previous example, we saw that the true causal relevance of smoking for lung cancer was revealed when we held exercise fixed, either positively (conditioning on C) or negatively (conditioning on not-C). This suggests that in evaluating the causal relevance of A for B, we need to hold fixed other causes of B, either positively or negatively. This suggestion is not entirely correct, however. Let A and B be smoking and lung cancer as above. Suppose C is a causal intermediary, say the presence of tar (and other carcinogens) in the lungs. If A causes B exclusively via C, then C will screen A off from B: given the presence (absence) of carcinogens in the lungs, the probability of lung cancer is not affected by whether those carcinogens got there by smoking (are absent despite smoking). Thus we will not want to hold fixed any causes of B *that are themselves caused by A*. Let us call the set of all factors that are causes of B, but are not caused by A, the set of *independent* causes of B. A test situation for A and B will then be a maximal conjunction, each of whose conjuncts is either an independent cause of B, or the negation of an independent cause of B.

Note that the specification of factors that need to be held fixed appeals to causal relations. This appears to rob the theory of its status as a *reductive analysis* of causation. We will see in section 4.4 below, however, that the issue is substantially more complex than that. In any event, even if there is no reduction of causation to probability, a theory detailing the systematic connections between causation and probability would be of great philosophical interest.

TS can be generalized in a number of ways. For example, one could define a 'negative cause' or 'preventer' or 'inhibitor' as a factor that lowers the probability of its 'effect' in all test situations, and a 'mixed' or 'interacting' cause as one that affects the probability of its 'effect' in different ways in different test situations. Or one could define causal relationships between variables that are non-binary, such as caloric intake and blood pressure. In principle, there are infinitely many ways in which one variable might depend probabilistically on another, even holding fixed some particular test situation, so this approach abandons any neat classification of causal factors into causes and preventers. These generalizations will also suggest revisions of the method for constructing test situations, since they suggest different sorts of factors to be held fixed.

An alternative approach to the problem of spurious correlations is through counterfactuals. According to a probabilistic counterfactual theory of causation *(PC),* A causes B if both occur and the probability that B would occur, at the time of A's occurrence, was much higher than it *would have been* at the corresponding time if A had not occurred. This counterfactual is to be understood in terms of possible worlds: it is true if, in the nearest possible world(s) where A does not occur, the probability of B is much lower than it was in the actual world. On this account, one does not compare conditional probabilities, but unconditional probabilities in different possible worlds. The test situation is not some specified conjunction of factors, but the sum total of all that remains unchanged in moving to the nearest possible world(s) where A does not occur. Obviously a great deal hinges here upon the account of what makes some worlds nearer than others; for more on this issue, see the entry under "causation, counterfactual theories."

Suggested Readings: This section more or less follows the main developments in the history of probabilistic theories of causation. Versions of the *NSO* theory are found in Reichenbach (1956, section 23), and Suppes (1970, chapter 2). Salmon (1980) is an influential critique of these theories. The first version of *TS* was presented in Cartwright (1979). Eells (1991, chapters 2, 3, and 4) and Hitchcock (1993) carry out the two generalizations of *TS* described. Lewis (1986) is the locus classicus for *PC*. Good (1961, 1962) is an early essay on probabilistic causation that is rich in insights, but has had surprisingly little influence on the formulation of later theories.

3.3 Asymmetry

The second major problem with the basic probability-raising idea was that the relationship of probability-raising is symmetrical. One way of cutting through the Gordian knot is to require that causes precede their effects in time. This has several systematic disadvantages. It rules out the possibility of backwards-in-time causation *a priori*, whereas many believe that it is only a contingent fact that causes precede their effects in time. This is less of a worry if one is not concerned to give a conceptual analysis of causation. Second, this approach rules out the possibility of developing a causal theory of temporal order (on pain of vicious circularity), a theory that has seemed attractive to some philosophers. Note also that while assigning temporal locations to particular events is entirely coherent, it is not so clear what it means to say that one property or event type occurs before another. For example, what does it mean to say that smoking precedes lung cancer? There have been many episodes of smoking, and many of lung cancer,

and not all of the former occurred prior to all of the latter. This will be a problem for those who are interested in providing a probabilistic theory of causal relations among properties or event types.

A more ambitious approach to the problem of causal asymmetry is to try to characterize that asymmetry in terms of probability relations alone. The best-known proposal of this sort is due to Hans Reichenbach. Suppose that factors A and B are positively correlated:

1. P(A & B) > P(A)P(B)

It is easy to see that this will hold exactly when A raises the probability of B and vice versa. Suppose, moreover, that there is some factor C having the following properties:

2. P(A & B|C) = P(A|C)P(B|C)

3. P(A & B|not-C) = P(A|not-C)P(B|not-C)

4. P(A|C) > P(A|not-C)

5. P(B|C) > P(B|not-C).

In this case, the trio ACB is said to form a *conjunctive fork*. Conditions 2 and 3 stipulate that C and not-C screen off A from B. As we have seen, this sometimes occurs when C is a common cause of A and B. Conditions 2 through 5 entail 1, so in some sense C explains the correlation between A and B. If C occurs earlier than A and B, and there is no event satisfying 2 through 5 that occurs later than A and B, then ACB is said to form a conjunctive fork *open to the future.* Analogously, if there is a future factor satisfying 2 through 5, but no past factor, we have a conjunctive fork open to the past. If a past factor C and a future factor D both satisfy 2 through 5, then ACBD forms a closed fork. Reichenbach's proposal was that the direction from cause to effect is the direction in which open forks predominate. In our world, there are many forks open to the future, few or none open to the past.

It is not clear, however, that this asymmetry between forks open to the past and open to the future will be as pervasive as this proposal seems to presuppose. In quantum mechanics, there are correlated effects that are believed to have no common cause that screens them off. Moreover, if ACB forms a conjunctive fork in which C precedes A and B, but C has a deterministic effect D which occurs after A and B, then ACBD will form a closed fork. A further difficulty with this proposal is that since it provides a global ordering of causes and effects, it seems to rule out a priori the possibility that some effects might precede their causes. More complex attempts to derive the direction of causation from probabilities have been offered; the issues here intersect with the problem of reduction, discussed in section 4.4 below.

Proponents of counterfactual theories of causation attempt to derive the asymmetry of causation from a corresponding asymmetry in the truth values of counterfactuals. For details see the entry for " causation, counterfactual theories."

Suggested Readings: Suppes (1970, chapter 2) and Eells (1991, chapter 5) define causal asymmetry in terms of temporal asymmetry. Reichenbach's proposal is presented in his (1956, chapter IV). Some difficulties with this proposal are discussed in Arntzenius (1993). Papineau (1993) is a good overall discussion of the problem of causal asymmetry within probabilistic theories.

4. Further Issues and Problems

4.1 Context-unanimity

According to *TS*, a cause must raise the probability of its effect in *every* test situation. This has been called the requirement of *context-unanimity*. This requirement is vulnerable to the following sort of counterexample. Suppose that there is a gene that has the following unusual effect: those that possess the gene have their chances of contracting lung cancer *lowered* when they smoke. This gene is very rare, let us imagine -- indeed, it need not exist at all in the human population, so long as humans have some non-zero probability of possessing this gene (perhaps as a result of a very improbable mutation). In this scenario, there would be test situations (those that hold fixed the presence of the gene) in which smoking lowers the probability of lung cancer: thus smoking would not be a cause of lung cancer according to the context-unanimity requirement. Nonetheless, it seems unlikely that the discovery of such a gene (or of the mere possibility of its occurrence) would lead us to abandon the claim that smoking causes lung cancer.

This line of objection is surely right about our ordinary use of causal language. It is nonetheless open to the defender of context-unanimity to respond that she is interested in supplying a precise concept to replace the vague notion of causation that corresponds to our everyday usage. In a population consisting of individuals lacking the gene, smoking causes lung cancer. In a population consisting entirely of individuals who possess the gene, smoking prevents lung cancer. In contexts where one desires causal information for purposes of deliberation (say concerning whether to smoke), it is this more precise type of information that is desired.

Suggested Readings: Dupré (1984) presents this challenge to the context-unanimity requirement, and offers an alternative. Eells (1991, chapters 1 and 2), defends context-unanimity using the idea that causal claims are made relative to a population.

4.2 Potential Counterexamples

Given the basic probability-raising idea, one would expect putative counterexamples to probabilistic theories of causation to be of two basic types: cases where causes fail to raise the probabilities of their effects, and cases where non-causes raise the probabilities of non-effects. The discussion in the literature has focused almost entirely on the first sort of example. Consider the following example, due to Deborah Rosen. A golfer badly slices a golf ball, which heads toward the rough, but then bounces off a tree and into the cup for a hole in one. The golfer's slice lowered the probability that the ball would wind up in the cup, yet nonetheless caused this result. One way of avoiding this problem is to attend to the probabilities that are being compared. If we label the slice A, not-A is a disjunction of several alternatives. One such alternative is a clean shot -- compared to this alternative, the slice lowered the probability of a hole-in-one. Another alternative is no shot at all, relative to which the slice increases the probability of a hole-in-one. By making the latter sort of comparison, we can recover our original intuitions about the example.

For an example of the second type, suppose that two gunmen shoot at a target. Each has a certain probability of hitting, and a certain probability of missing. Assume that none of the probabilities are one or zero. As a matter of fact, the first gunman hits, and the second gunman misses. Nonetheless, the second gunman did fire, and by firing, increased the probability that the target would be hit, which it was. While it is obviously wrong to say that the second gunman's shot caused the target to be hit, it would seem that a probabilistic theory of causation is committed to this consequence. A natural approach to this problem would be to try to strengthen the probabilistic theory of causation with a requirement of spatiotemporal connection between cause and effect (see the entry on "causation, causal processes"), but to date, no successful proposal along these lines has been proffered.

Suggested Readings: Salmon (1980) presents several examples of probability-lowering causes. Hitchcock (1995) presents a response. Woodward (1990) describes the structure that is instantiated in the example of the two gunmen. Humphreys (1989, section 14) responds. Menzies (1989, 1996) discusses examples involving causal pre-emption where non-causes raise the probabilities of non-effects.

4.3 Singular and General Causation

We make at least two different kinds of causal claim. *Singular* causal claims, such as "Jill's heavy smoking during the '80's caused her to develop lung cancer," relate particular events that have spatiotemporal locations. *General* causal claims, such "smoking causes lung cancer" relate event types or properties. With this distinction in mind, we may note that the counterexamples mentioned above are both formulated in terms of singular causation. The examples do not undermine the *General* causal claims that a probabilistic theory of causation would appear to license in these cases: slices prevent (are negative causes of) holes-in-one; shooting at targets causes them to be hit. So one possible reaction to the counterexamples of the previous section would be to maintain that the probabilistic theory of causation whose development was sketched in section 3 above is a theory of general causation only, and that singular causation requires a distinct philosophical theory. One consequence of this move is that there are (at least) two distinct species of causal relation, each requiring its own philosophical account--not an altogether happy predicament.

Suggested Readings: The need for distinct theories of singular and general causation is defended in Good (1961, 1962), Sober (1985), and Eells (1991, introduction and chapter 6). Eells (1991, chapter 6) offers a distinct probabilistic theory of singular causation in terms of the temporal evolution of probabilities. Carroll (1991) and Hitchcock (1995) offer two quite different lines of response.

4.4. Reduction and Circularity

Returning to the theories outlined in section 3, recall that theory *NSO* was an attempt at a *reductive analysis* of causation in terms of probabilities (and perhaps also temporal order). By contrast, *TS* defines causal relations in terms of probabilities conditional upon specifications of test conditions, which are themselves characterized in causal terms. Thus it appears that the latter theories cannot be analyses of causation, since causation appears in the analysans. Given that *TS* contains much needed improvements over *NSO*, it looks as though there can be no reduction of causation to probabilities. This may be giving up too soon, however. In order to determine whether a probabilistic reduction of causation is possible, the central issue is not whether the word ‘cause’ appears in both the analysandum and the analysans; rather, the key question should be whether, given an assignment of probabilities to a set of factors, there is a unique set of causal relations among those factors compatible with the probability assignment and the theory in question. Suppose that a set of factors, and a system of causal relations among those factors is given: call this the *causal structure CS*. Let *T* be a theory connecting causal relations among factors with probabilistic relations among factors. Then the causal structure *CS* will be *probabilistically distinguishable* relative to *T*, if for every assignment of probabilities to the factors in *CS* that is compatible with *CS* and *T*, *CS* is the unique causal structure compatible with *T* and those probabilities. (One could formulate a weaker sense of distinguishability by requiring that only some assignment of probabilities uniquely determines *CS*). Intuitively, *T* allows you to infer that the causal structure is in fact *CS* given the probability relations between factors. Given a probabilistic theory of causation *T*, it is possible to imagine many different properties it might have. Here are some possibilities:

1. All causal structures are probabilistically distinguishable relative to *T*

2. All causal structures having some interesting property are probabilistically distinguishable relative to *T*

3. Any causal structure can be embedded in a causal structure that is probabilistically distinguishable relative to *T*

4. The actual causal structure of the world (assuming there is such a thing) is probabilistically distinguishable relative to *T* .

It is not obvious which type of distinguishability properties a theory must have in order to constitute a reduction of causation to probabilities. This sort of approach to the question of probabilistic reduction is quite new, and currently an active area of investigation.

Suggested Readings: The most detailed treatment of probabilistic distinguishability is given in Spirtes, Glymour and Scheines (1993); see especially chapter 4. Spirtes, Glymour and Scheines prove (theorem 4.6) a result along the lines of 3 for a theory that they propose. This work is very technical. An accessible presentation is contained in Papineau (1993), which defends a position along the lines of 4.

Causal Processes

Taking their point of departure from what science tells us about the world rather than from our everyday concept of a ‘process’, philosophers interested in analysing causal processes have tended to see the chief task to be to distinguish *causal* processes such as atoms decaying and billiard balls moving across the table from *pseudo* processes such as moving shadows and spots of light. These philosophers have found, in the notion of a causal process, a key to understanding causation in general.

1. Russell's Theory of Causal Lines

An important forerunner of contemporary notions of causal processes is Bertrand Russell's account of causal lines. This may be surprising to those who are more accustomed to associate the name ‘Bertrand Russell’ with scepticism about causation. Russell's 1912/13 paper, ‘On the Notion of Cause’, is famous for the quote,

> The law of causality, I believe, like much that passes muster among philosophers, is a relic of a bygone age, surviving, like the monarchy, only because it is erroneously supposed to do no harm. (Russell, 1913, p. 1).

In that paper Russell argued that the philosopher's concept of causation involving, as it does, the law of universal determinism that every event has a cause and the associated concept of causation as a relation between events, is "otiose" and in modern science is replaced by the concept of causal laws understood in

terms of functional relations, where these causal laws are not necessarily deterministic.

However, in a later book written in 1948, entitled *Human Knowledge* Bertrand Russell outlines a similar view but does so in language which is much more flattering to causation. He still holds that the philosophical idea of causation should be seen as a primitive version of the scientific idea of causal laws. Nevertheless, his emphasis now is on certain postulates of causation which he takes to be fundamental to scientific (inductive) inference, and Russell's aim is to show how scientific inference is possible.

The problem with thinking about causal laws as the underpinning of scientific inference is that the world is a complex place, and while causal laws might hold true, they often do not obtain because of preventing circumstances, and it is impractical to bring in innumerable ‘unless’ clauses. But, even though there is infinite complexity in the world, there are also causal lines of quasi-permanence, and these warrant our inferences.

Russell elaborates these ideas into five postulates which he says are necessary "to validate scientific method" (1948, p. 487). The first is ‘The Postulate of Quasi-permanence’ which states that there is a certain kind of persistence in the world, for generally things do not change discontinuously. The second postulate, ‘Of Separable Causal Lines’, allows that there is often long term persistence in things and processes. The third postulate, ‘Of Spatio-temporal Continuity’ denies action at a distance. Russell claims "when there is a causal connection between two events that are not contiguous, there must be intermediate links in the causal chain such that each is contiguous to the next, or (alternatively) such that there is a process which is continuous." (1948, p. 487). ‘The Structural Postulate’, the fourth, allows us to infer from structurally similar complex events ranged about a centre to an event of similar structure linked by causal lines to each event. The fifth postulate, ‘Of Analogy’ allows us to infer the existence of a causal effect when it is unobservable.

The key postulate concerns the idea of causal lines or, in our terminology, causal processes. Russell's 1948 view is that causal lines replace the primitive notion of causation in the scientific view of the world, and not only replace but also explain the extent to which the primitive notion, causation, is correct. He writes,

> The concept "cause", as it occurs in the works of most philosophers, is one which is apparently not used in any advanced science. But the concepts that are used have been developed from the primitive concept (which is that prevalent among philosophers), and the primitive concept, as I shall try to show, still has importance as the source of approximate generalisations and pre-scientific inductions, and as a concept which is valid when suitably limited. (1948, p. 471).

Russell also says, "When two events belong to one causal line the earlier may be said to "cause" the later. In this way laws of the form "A causes B" may preserve a certain validity." (1948, p. 334). So Russell can be seen, in his 1948 book, as proposing the view that within limits causal lines, or causal processes, may be taken to analyse causation. So what is a causal line? Russell writes,

> I call a series of events a "causal line" if, given some of them, we can infer something about the others without having to know anything about the environment. (1948, p. 333).
>
> A causal line may always be regarded as a persistence of something, a person, a table, a photon, or what not. Throughout a given causal line, there may be constancy of quality, constancy of structure, or gradual changes in either, but not sudden change of any considerable magnitude. (1948, pp. 475-7).

So the trajectory through time of something is a causal line if it doesn't change too much, and if it persists in isolation from other things. A series of events which display this kind of similarity display what Russell calls ‘quasi-permanence’.

> The concept of more or less permanent physical object in its common-sense form involves "substance", and when "substance" is rejected we have to find some other way of defining the identity of a physical object at different times. I think this must be done by means of the concept "causal line". (1948, p. 333).

Elsewhere Russell writes,

> The law of quasi-permanence as I intend it ... is designed to explain the success of the common-sense notion of "things" and the physical notion of "matter" (in classical physics). ... a "thing" or a piece of matter is not to be regarded as a single persistent substantial entity, but as a string of events having a certain kind of causal connection with each other. This kind is what I call "quasi-permanence". The causal law that I suggest may be enunciated as follows: "Given an event at a certain time, then at any slightly earlier or slightly later time there is, at some neighbouring place, a closely similar event". I do not assert that this happens always, but only that it happens very often- sufficiently often to give a high probability to an induction confirming it in a particular case. When "substance" is abandoned, the identity, for commonsense, of a thing or a person at different times must be explained as consisting in what may be called a "causal line". (1948, pp. 475-7).

This has relevence for the question of identity through time, and in *Human Knowledge* we find that Bertrand Russell sees that there is an important connection between causal process and identity, namely, that the concept of a causal line can be used to explain the identity through time of an object or a person.

So what we may call Russell's causal theory of identity (Dowe, forthcoming) asserts that the identity over time of an object or a person consists in the different temporal parts of that person being all part of the one causal line. This is the causal theory of identity (Armstrong, 1980) couched in terms of causal processes or lines. A causal line in turn is understood by way of an inference which is licensed by the law of quasi permanence.

2. Objections to Russell's Theory

Wesley Salmon has urged a number of objections against Russell's theory of causal lines. (1984, p. 140-5). The first objection is that Russell's theory is couched in epistemic terms rather than ontological terms, yet causation is itself an ontic matter not an epistemic matter. Russell's account is formulated in terms of how we make inferences. For example, Russell says

> A "causal line," as I wish to define the term, is a temporal series of events so related that, given some of them, something can be inferred about the others whatever may be happening elsewhere. (1948, p. 459).

Salmon's criticism of this is precisely that it is formulated in epistemic terms, "for the existence of the vast majority of causal processes in the history of the universe is quite independent of human knowers." (1984, p. 145). Salmon, as we shall see in the next section, develops *his* account of causal processes as an explicitly ‘ontic’, as opposed to an ‘epistemic’ account. (1984, ch. 1).

There is a further reason why Russell's epistemic approach is unacceptable. While it is true that causal processes *do* warrant inferences of the sort Russell has in mind, it is not the case that all rational inferences are warranted by the existence (‘postulation’, in Russell's thinking) of causal lines. There are other types of causal structures besides a causal line. Russell himself gives an example: two clouds of incandescent gas of a given element both emit the same spectral lines, but are not causally connected. (1948, p. 455). Yet we may rightly make inferences from one to the other. A pervasive type of case is where two events are not directly causally connected but have a common cause.

The second objection is that Russell's theory of a causal line does not enable the distinction between pseudo and causal processes to be made, yet to delineate causal from pseudo processes is a key issue which needs to be addressed by any theory of causal processes. As Reichenbach argued (1958, pp. 147-9), as he reflected on the implications of Einstein's special theory of relativity, science requires that we distinguish between causal and pseudo processes. Reichenbach noticed that the central principle that nothing travels faster than the speed of light is ‘violated’ by certain processes. For example, a spot of light moving along a wall is capable of moving faster than the speed of light. (One needs just a powerful enough light and a wall sufficiently large and sufficiently distant.) Other examples include shadows, and the point of intersection of two rulers (see Salmon's clear exposition in his 1984, pp. 141-4). Such pseudo processes, as we shall call them (Reichenbach called them "unreal sequences"; 1958, pp. 147-9), do not violate special relativity, Reichenbach argued, simply because they are not causal processes, and the principle that nothing travels faster than the speed of light applies only to causal processes. Thus special relativity demands a distinction between causal and pseudo processes. But Russell's theory doesn't explain this distinction, because both causal processes and pseudo processes display constancy of structure and quality; and both licence inferences of the sort Russell has in mind. For example, the phase velocity of a wave packet is a pseudo process but the group velocity is a causal process; yet both licence reliable predictions.

3. Salmon's Process Theory

In this section we consider Wesley Salmon's theory of causality as presented in his book *Scientific Explanation and the Causal Structure of the World* (1984). Although it draws on the work of Reichenbach and Russell, Salmon's theory is highly original and contains many innovative contributions. Salmon's broad objective is to offer a theory which is consistent with the following assumptions: (a) causality is an *objective* feature of the world; (b) causality is a *contingent* feature of the world; (c) a theory of causality must be consistent with the possibility of *indeterminism*; (d) the theory should be (in principle) *time-independent* so that it is consistent with a causal theory of time; (e) the theory should not violate Hume's strictures concerning ‘hidden powers’.

Salmon treats causality as primarily a characteristic of continuous processes rather than as a relation between events. His theory involves two elements, the *production* and the *propagation* of causal influence. (See, for example, 1984, p. 139.) The latter is achieved by causal processes. Salmon defines a process as anything that displays consistency of structure over time. (1984, p.144). To distinguish between causal and pseudo processes (which Reichenbach called "unreal sequences"; 1958, pp. 147-9). Salmon makes use of Reichenbach's ‘mark criterion’: a process is causal if it is capable of transmitting a local modification in structure (a ‘mark’) (1984, p. 147). Drawing on the work of Bertrand Russell, Salmon seeks to explicate the notion of ‘transmission’ by the ‘at-at theory’ of mark transmission. The principle of mark transmission (MT) states:

> MT: Let P be a process that, in the absence of interactions with other processes would remain uniform with respect to a characteristic Q, which it would manifest consistently over an interval that includes both of the space - time points A and B (A - B). Then, a mark (consisting of a modification of Q into Q*), which has been introduced into process P by means of a single local interaction at a point A, is transmitted to point B if [and only if] P manifests the modification Q* at B and at all stages of the process between A and B without additional interactions. (1984, p. 148).

Salmon himself omits the ‘only if’ condition. However, as suggested by Sober (1987, p. 253), this condition is essential because the principle is to be used to identify pseudo processes on the grounds that they do not transmit a mark (Dowe, 1992b, p. 198). Thus for Salmon a causal process is one which can transmit a mark, and it is these spatiotemporally continuous processes that propagate causal influence.

To accompany this theory of the propagation of causal influence, Salmon also analyses the production of causal processes. According to Salmon, causal production can be explained in terms of causal forks, whose main role is the part they play in the production of order and structure of causal processes. The causal forks are characterised by statistical forks; to Reichenbach's ‘conjunctive fork’ Salmon has added the ‘interactive’ and ‘perfect’ forks, each corresponding to a different type of common-cause.

Firstly there is the ‘conjunctive fork’, where two processes arise from a special set of background conditions often in a non-lawful fashion. (Salmon, 1984, p. 179). In such a case we get a statistical

correlation between the two processes which can be explained by appealing to the common cause, which ‘screens off’ the statistical connection. This is the principle of the common cause (due originally to Reichenbach (1956)) which, stated formally, is that if, for two events A and B,

$$(1)\ P(A.B) > P(A).P(B)$$

holds, then look for an event C such that

$$(2)\ P(A.B|C) = P(A|C).P(B|C)$$

The events A, B, and C form a conjunctive fork (For the full account see Salmon, 1984, ch. 6). In Salmon's theory of causality, conjunctive forks produce structure and order from ‘de-facto’ background conditions.(1984, p. 179).

Secondly, there is the ‘interactive fork’, where an intersection between two processes produces a modification in both (1984, p. 170) and an ensuing correlation between the two processes cannot be screened off by the common cause. Instead, the interaction is governed by conservation laws. For example, consider a pool table where the cue ball is placed in such a position relative to the eight ball that, if the eight ball is sunk in one pocket A , the cue ball will almost certainly drop into the other pocket B. There is a correlation between A and B such that equation (1) holds. But the common cause C, the striking of the cue ball, does not screen off this correlation. Salmon has suggested that the interactive fork can be characterised by the relation

$$(3)\ P(A.B|C) > P(A|C).P(B|C)$$

together with (1). (1978, p. 704, n. 31). Interactive forks are involved in the production of modifications in order and structure of causal processes. (1982, p. 265; 1984, p. 179). In this paper ‘interactive fork’ is used to mean precisely ‘a set of three events related according to equations (1) and (3)’.

The idea of a causal interaction is further analysed by Salmon in terms of the notion of mutual modification. The principle of causal interaction (CI) states:

> CI: Let P1 and P2 be two processes that intersect with one another at the space-time S, which belongs to the histories of both. Let Q be a characteristic of that process P1 would exhibit throughout an interval (which includes subintervals on both sides of S in the history of P1) if the intersection with P2 did not occur; let R be a characteristic that process P2 would exhibit throughout an interval (which includes subintervals on both sides of S in the history of P2) if the intersection with P1 did not occur. Then, the intersection of P1 and P2 at S constitutes a causal interaction if (1) P1 exhibits the characteristic Q before S, but it exhibits a modified characteristic Q* throughout an interval immediately following S; and (2) P2 exhibits R before S but it exhibits a modified characteristic R′ throughout an interval immediately following S. (1984, p. 171).

Thirdly, there is the perfect fork, which is the deterministic limit of both the conjunctive and interactive fork. It is included as a special case because in the deterministic limit the interactive fork is indistinguishable from the conjunctive fork. (1984, pp. 177-8). Thus, a perfect fork could be involved in either the production of order and structure, or the production of changes in order and structure of causal processes.

4. Objections to Salmon's Theory

The major objection against Samon's account of causal processes concerns the adequacy of the mark theory (Dowe, 1992a; 1992b; Kitcher, 1989). The mark transmission (MT) principle carries a considerable burden in Salmon's account, for it provides the criterion for distinguishing causal from pseudo processes. However, it has serious shortcomings in doing this. In fact, it fails on two counts: it excludes many causal processes; and it fails to exclude many pseudo processes. We shall consider each of these problems in turn.

1. MT *excludes causal processes*. Firstly, the principle requires that processes display *a degree of uniformity over a time period*. This distinguishes processes (causal and pseudo) from ‘spatiotemporal junk’, to use Kitcher's term. One problem with this is that it seems to exclude many causal effects which are short lived. For example, short lived subatomic particles play important causal roles, but they don't seem to qualify as causal processes. On any criterion there are causal processes which are ‘relatively short lived’. Also, the question concerning how long a regularity must persist raises philosophical difficulties about degrees which need answering before we have an adequate distinction between processes and spatiotemporal junk. However, if these were the only difficulties I think that the theory could be saved. Unfortunately, they are not.

More seriously, the MT principle requires that causal processes would remain uniform *in the absence of interactions* and that marks can be transmitted *in the absence of additional interventions*. However, in real situations processes are continuously involved in interactions of one sort or another.(Kitcher, 1989, p. 464). Even in the most idealised of situations interactions of sorts occur. For example, consider a universe that contains only one single moving particle. Not even this process moves in the absence of interactions, for the particle is forever intersecting with spatial regions. If we required that the interactions be causal (at the risk of circularity), then it is still true that in real cases there are many causal interactions continuously affecting processes. Even in carefully controlled scientific experiments there are many (admittedly irrelevant) causal interactions going on. Further, Salmon's central insight that causal processes are self propagating is not entirely well founded. For while some causal processes (light radiation, inertial motion) are self propagating, others are not. Falling bodies and electric currents are moved by their respective fields. (In particular there is no electric counterpart to inertia.) Sound waves are propagated within a medium, and simply do not exist ‘in the absence of interactions’. Such processes require a ‘causal background’, some can even be described as being a series of causal interactions. These causal processes *cannot* move in the absence of interactions. Thus there are a whole range of causal processes which are excluded by the requirement that they would remain uniform in the absence of any

interactions.

It seems desirable, therefore, to abandon the requirement that a causal process is one that is capable of transmitting a mark in the absence of further interactions. However, the requirement is there for a reason, and that is that without it the theory is open to the objection that certain pseudo processes will count as being capable of transmitting marks. Salmon considers a case where a moving spot is marked by a red filter held up close to the wall. If someone ran alongside the wall holding up the filter, then it seems that the modification to the process is transmitted beyond the space-time locality of the original marking interaction. Thus there are problems if the requirement is kept, and there are problems if it is omitted. So it is not clear how the theory can be saved from the problem that some causal processes can not move in the absence of further interactions.

2. MT *fails to exclude pseudo processes*. Salmon's explicit intention in employing the MT principle is to show how pseudo processes are different from causal processes. If MT fails here then it fails its major test. However, a strong case can be made for saying that it does indeed fail this test.

Firstly, there are cases where pseudo processes qualify as being capable of transmitting a mark, because of the *vagueness of the notion of a characteristic*. We have seen that Salmon's approach to causality is to give an informal characterisation of the concepts of ‘production’ and ‘propagation’. In these characterisations, the primitive notions include ‘characteristic’, but nothing precise is said about this notion. While Salmon is entitled to take this informal approach, in this case more needs to be said about a primitive notion such as ‘characteristic’, at least indicating the range of its application, because the vagueness renders the account open to counter-examples.

For example, in the early morning the top (leading) edge of the shadow of the Sydney Opera House has the characteristic of being closer to the Harbour Bridge than to the Opera House. But later in the day (at time *t* say), this characteristic changes. This characteristic qualifies as a mark by IV, since it is a change in a characteristic introduced by the local intersection of two processes, namely, the movement of the shadow across the ground, and the (stationary) patch of ground which represents the midpoint between the Opera House and the Harbour Bridge. By III this mark which the shadow displays continuously after time *t*, is transmitted by the process. Thus, by II, the shadow is a causal process. This is similar to Sober's counter-example of where a light spot ‘transmits’ the characteristic of occurring after a glass filter is bolted in place. (1987, p. 254).

So there are some restrictions that need to be placed on the type of property allowed as a characteristic. Having the property of "occurring after a certain time" (Sober, 1987, p. 254),or the property of "being the shadow of a scratched car" (Kitcher, 1989, p. 638) or the property of "being closer to the Harbour Bridge than to the Opera House" (Dowe, 1992b, sec. 2.2) can qualify a shadow to be a causal process. There is a need to specify what kinds of properties can count as the appropriate characteristics for marking. It is not sufficient to say that the mark has to be introduced by a single local interaction, for as the above discussion suggests it is always possible to identify a single local interaction.

The difficulty lies in the type of characteristic allowed. A less informal approach to the subject could have provided, for example, a restriction of ‘property’ to ‘non-relational property’, thereby avoiding this particular problem.

There are a number of possible ways to provide a more precise account of ‘characteristic’, either in philosophical terms such as ‘property’; or in terms of precise scientific notions such as ‘molecular structure’, ‘energy’ or ‘information’. In physics and chemistry description of the structure of a molecule, or larger solid body is given in terms of geometrical arrangement as well as the constituent particles and bonding forces. In biology the *structure* of a cell refers to its geometry as well as its constituents. Clearly a specific definition such as ‘chemical structure’ is not broad enough for Salmon's purposes. Although he uses examples such as the drug which causes a person to lose consciousness because it retains its ‘chemical structure’ as it is absorbed into the blood stream (1984, p. 155) it is nevertheless clear that the ‘structure’ of a car, a golf ball, a shadow, or a pulse of light is not simply ‘chemical structure.’ But perhaps this suggests a general characterisation in terms of constituent material, bonding forces and geometrical shape. I believe such an account has a lot of potential. For example, a chalk mark on a ball is a change in constituent material, a dent in a car is a change in geometrical shape, etc.

A different approach would be to link ‘characteristic’ to ‘property’ of which there are precise philosophical accounts available. (For example, (Armstrong, 1978)). Rogers takes this approach, defining the state of a process as the set of properties of the process at a given time. (Rogers, 1981, p. 203). A ‘law of non-interactive evolution’ gives the probability of the possible states at a later time, conditional on the actual state.

However, even if that approach were successful, there are further difficulties of a different kind. Firstly, there are cases of "derivative marks" (Kitcher, 1989, p. 463) where a pseudo process displays a modification in a characteristic on account of a change in the causal processes on which it depends. This change could either be in the source, or in the causal background. A change at the source would include cases where the spotlight spot is ‘marked’ by a coloured filter at the source (Salmon, 1984, p. 142) or a car's shadow is marked when a passenger's arm holds up a flag. (Kitcher, 1989, p. 463).

The clause ‘by means of a single *local* interaction’ is intended to exclude this type of example: but it is not clear that this works, for does not the shadow intersect with the modified sunlight pattern *locally*? It is true that the ‘modified sunlight pattern’ originated, or was caused by, the passenger raising his arm with the flag, but the fact that the marking interaction is the result of a chain of causes cannot be held to exclude those interactions, for genuine marking interactions are always the result of a chain of causal processes and interactions. (Kitcher, 1989, p. 464) Similarly, there is a local spacetime intersection of the spotlight spot and the red beam.

However, even if the ‘local’ requirement did exclude these cases, there are other cases where pseudo processes can be marked by changes in the causal background which are local. For example, imagine that there is a long stretch of road where the side of the road is flat, then farther along there is a long fence close to the road. The shadow of the car will change its shape abruptly as the car reaches the fence. We

can say that there is a local interaction between the shadow and the beginning of the fence which produces a permanent modification to the shadow. A similar case is where a person runs around an astrodome holding up a red filter which modifies the spot. The clause ‘by means of a single local interaction’ is intended to block these cases: but if this is employed too heavily it would exclude causal processes as well, such as Salmon's paradigm case where a red filter modifies the light beam. In this case the filter continues to act on the beam, just like the fence or the moving filter cases.

In any case it is possible to modify a pseudo process by a single interaction: take the case where a stationary car (a causal process) throws its shadow on a fence. Suddenly the fence falls over, producing a permanent modification in the shadow. Then the shadow has been marked by the single local action of the falling fence. Salmon's counterfactual requirement that the process would remain uniform (presumably in the absence of the marking interaction, all other things being equal) does not help in these cases: the shadow would have remained uniform had the fence not fallen. Indeed most of the above cases fulfil this counterfactual requirement. Further, these cases are not ruled out by attempts to restrict the kinds of admissible properties by admitting only those which can be detected by physically possible detectors, since the relevant property here is shape, which certainly is detectable by physical detectors. So there does not seem to be any obvious way of answering this difficulty. Thus there are two separate classes of pseudo processes (in Kitcher's terminology, derivative marks and pseudomarks) which qualify as causal according to the MT principle.

5. The Conserved Quantity Theory

The idea of appealing to conserved quantities has its forerunners in Aronson's and Fair's appeal to energy and momentum. (Aronson, 1971; Fair, 1979) But the first explicit formulation was given in a brief suggestion made by Skyrms in 1980, in his book *Causal Necessity* (1980, p. 111) and the first detailed conserved quantity theory by Dowe (1992a; 1992b). See also Salmon, 1994 and Dowe, 1995. The conserved quantity theory can be expressed in two propositions:

> CQ1. A *causal process* is a world line of an object which possesses a conserved quantity.
>
> CQ2. A *causal interaction* is an intersection of world lines which involves exchange of a conserved quantity.

A *process* is the world line of an object, regardless of whether or not it possesses any conserved quantities. A process can be either causal or non-causal (pseudo). A *world line* is the collection of points on a space-time (Minkowski) diagram which represents the history of an object. This means that processes are determinate regions, or ‘worms’, in space time. Such processes, or worms in space time, will normally be time-like; that is, every point on its world line lies in the future lightcone of the process' starting point.

An *object* is anything found in the ontology of science (such as particles, waves or fields), or common

sense (such as chairs, buildings, or people). This will include non-causal objects such as spots and shadows. It is important to appreciate the difference between an object and a process. Loosely speaking, a process is the development over time of an object. Processes are usually extended in time.

Worms in space time which are not processes Kitcher calls 'spatiotemporal junk' (1989). Thus a representation on a space time diagram represents either a process or a piece of spatiotemporal junk, and a process is either a causal or a pseudo process. In a sense what counts as an object is unimportant; any old gerrymandered thing qualifies (except time-wise gerrymanders) (Dowe, 1995). In the case of a causal process what matters is whether the object possesses the right type of quantity. A shadow is an object but it does not possess the right type of conserved quantities; for example, a shadow cannot possess energy or momentum. It has other properties, such as shape, velocity, and position but possesses no conserved quantities. (The theory could be formulated in terms of *objects*: there are causal objects and pseudo objects. Causal objects are those which possess conserved quantities, pseudo objects are those which do not. Then a causal process is the world line of a causal object.)

A *conserved quantity* is any quantity which is universally conserved, and current scientific theory is our best guide as to what these are. For example, we have good reason to believe that mass-energy, linear momentum, and charge are conserved quantities.

An *intersection* is simply the overlapping in space time of two or more processes. The intersection occurs at the location consisting of all the space time points which are common to both (or all) processes. An *exchange* occurs when at least one incoming, and at least one outgoing process undergoes a change in the value of the conserved quantity, where 'outgoing' and 'incoming' are delineated on the space-time diagram by the forward and backward light cones, but are essentially interchangeable. The exchange is governed by the conservation law, which guarantees that it is a genuine causal interaction. It follows that an interaction can be of the form X, Y, l, or of a more complicated form.

'Possesses' is to be understood in the sense of 'instantiates'. We suppose an object possesses energy if science attributes that quantity to that body. It does not matter whether that process transmits the quantity or not, nor whether the object keeps a constant amount of the quantity. It must simply be that the quantity may be truly predicated of the object.

6. Objections to the Conserved Quantity Theory

Salmon (1994, p. 308) has argued that the conserved quantity theory requires "transmits" rather than just "possesses": Consider a rotating spotlight spot moving around the wall of a large building. This is a classic case of a pseudo-process: in theory such a spot could move faster than the speed of light. But the spot manifests energy at each point along its trajectory. Therefore, Salmon's argument goes, we need more than just the regular appearance of energy to characterise causal processes; we need the notion of transmission. In this section I show how the CQ theory avoids this problem without appealing to the notion of transmission.

Dowe (1992a, p. 127) had argued as follows: a spot or moving patch of illumination does not possess conserved quantities. A moving spot has other properties: speed, size, shape etc; but not *conserved* quantities such as energy or momentum. What possesses the energy which is "regularly appearing" is not the spot but a series of different patches of the wall. The spot and the patch of wall are *not* the same object. The patch of wall does not move. It *does* possess conserved quantities, *its* world line does constitute a causal process, and *it* is not capable of moving faster than the speed of light. The spot does move, but does *not* possess energy and *is* capable of moving faster than the speed of light. Therefore "whether or not an object possesses a conserved quantity" is an adequate criterion for distinguishing causal from pseudo processes.

Salmon (1994, p. 308) provides an ingenious counterexample to this account. He asks us to consider "the worldline of the part of the wall surface that is absorbing energy as a result of being illuminated". (1994, p. 308). This "gerrymandered" object is the aggregate of all the patches of wall that are sequentially illuminated, taken only for the time that they are currently being illuminated. Salmon argues that this object does possess energy over the relevant interval, but does not *transmit* energy. The implication is that the world line of this object is not a causal process, yet the object possesses energy; therefore we need to invoke the notion of transmission- possession is not enough. Salmon himself proposes a new theory which combines elements of his earlier account with elements of the conserved quantity theory).

In response to Salmon's objection Dowe introduces a further condition: that an object wholly exists at a time (1995; forthcoming). This allows him to say that objects have a primitive identity over time. But, while this does rule out what Dowe calls 'timewise gerrymanders' (1995), it is unlikely to satisfy critics such as Salmon because it seems to introduce into the theory an element which is irreducibly hidden to empirical investigation.

Counterfactual Theories of Causation

The basic idea of counterfactual theories of causation is that the meaning of a singular causal claim of the form "Event *c* caused event *e*" can be explained in terms of counterfactual conditionals of the form "If *c* had not occurred, *e* would not have occurred". Analyses along these lines have become popular in the last quarter of the twentieth century, especially since the development in the 1970's of possible world semantics for counterfactuals. The best known counterfactual analysis of causation is David Lewis's (1973b) theory. However, intense discussion over twenty years has cast doubt on the adequacy of any simple analysis of singular causation in terms of counterfactuals. Recent years have seen a proliferation of different refinements of the basic idea to achieve a closer match with commonsense judgements about causation.

---

1. Early Counterfactual Theories

The first explicit definition of causation in terms of counterfactuals was, surprisingly enough, given by Hume, when he wrote: "We may define a cause to be *an object followed by another, and where all the objects, similar to the first, are followed by objects similar to the second*. Or, in other words, *where, if the first object had not been, the second never had existed*." (1748, Section VII). It is difficult to understand how Hume could have confused the first, regularity definition with the second, very different counterfactual definition.

At any rate, Hume never explored the alternative counterfactual approach to causation. In this, as in much else, he was followed by generations of empiricist philosophers. The chief obstacle in empiricists' minds to explaining causation in terms of counterfactuals was the obscurity of counterfactuals

themselves, owing chiefly to their reference to unactualised possibilities. Starting with J. S. Mill (1843), empiricists tried to analyse counterfactuals 'metalinguistically' in terms of implication relations between statements. The rough idea is that a counterfactual of the form "If it had been the case that A, it would have been the case that *C*" is true if and only if there is an auxiliary set *S* of true statements consistent with the antecedent *A*, such that the members of *S*, when conjoined with *A*, entail the consequent *C*. Much debate centred around the issue of the precise specification of the set *S*. (See N. Goodman (1983).) Most empiricists agreed that *S* would have to include statements of laws of nature, while some thought that it would have to include statements of singular causation. While the truth conditions of counterfactuals remained obscure in these ways, few empiricists thought it worthwhile to try to explain causation via counterfactuals.

Indeed, the first real attempts to present rigorous counterfactual analyses of causation came only in the late 1960's. (See A. Lyon's (1967).) Typical of these attempts was J. L. Mackie's counterfactual analysis in Chapter 2 of his seminal book *The Cement of the Universe* (1974). As well as offering a sophisticated regularity theory of causation 'in the objects', Mackie presented a counterfactual account of the concept of a cause as "what makes the difference in relation to some background or causal field" (1980, p.xi). Mackie's account of the concept of causation is rich in insights, especially concerning its relativity to a field of background conditions. However, his account never gained as much attention as his regularity theory of causation 'in the objects', no doubt because his view of counterfactuals (in his (1973)), as condensed arguments that do not have truth values, compounded empiricists' scepticism about counterfactuals.

The true potential of the counterfactual approach to causation did not become clear until counterfactuals became better understood through the development of possible world semantics in the early 1970's.

2. Lewis's 1973 Counterfactual Analysis

The best known and most thoroughly elaborated counterfactual theory of causation is David Lewis's theory in his (1973b), which was refined and extended in articles subsequently collected in his (1986a). In response to doubts about the theory's treatment of preemption, Lewis has recently proposed a fairly radical revision of the theory . (See his Whitehead Lectures published in his (2001a), and in a shortened form in his (2000).) In this section we shall confine our attention to the original 1973 theory, deferring for later consideration the recent changes he has proposed.

2.1 Counterfactuals and Causal Dependence

Like most contemporary counterfactual theories, Lewis's theory employs a possible world semantics for counterfactuals. Such a semantics states truth conditions for counterfactuals in terms of relations among possible worlds. Lewis famously espouses a realism about possible worlds, according to which non-actual possible worlds are real concrete entities on a par with the actual world. (See Lewis's defence of modal realism in his (1986e).) However, most contemporary philosophers would seek to deploy the explanatorily fruitful possible worlds framework while distancing themselves from full-blown realism about possible worlds themselves. For example, many would propose to understand possible worlds as maximally consistent sets of propositions; or even to treat them instrumentally as useful theoretical entities having no independent reality.

The central notion of a possible world semantics for counterfactuals is a relation of *comparative similarity* between worlds (Lewis (1973a)). One world is said to be *closer to actuality* than another if the first resembles the actual world more than the second does. Shortly we consider the respects of similarity that Lewis says are important for the counterfactuals linked to causation. For now we simply note two formal constraints he imposes on this similarity relation. First, the relation of similarity produces a weak ordering of worlds so that any two worlds can be ordered with respect to their closeness to the actual world, with allowance being made for ties in closeness. Secondly, the actual world is closest to actuality, resembling itself more than any other world resembles it.

In terms of this similarity relation, the truth condition for the counterfactual "If *A* were (or had been) the case, *C* would be (or have been) the case", symbolised as $A \Box\!\!\rightarrow C$, is stated as follows:

> (1) $A \Box\!\!\rightarrow C$ is *true* in the actual world if and only if (i) there are no possible *A*-worlds; or (ii) some *A*-world where *C* holds is closer to to the actual world than is any *A*-world where *C* does not hold.

We shall ignore the first case in which the counterfactual is vacuously true. The fundamental idea of this analysis is that the counterfactual $A \Box\!\!\rightarrow C$ is true just in case it takes less of a departure from actuality to make the antecedent true along with the consequent than to make the antecedent true without the consequent.

In terms of counterfactuals, Lewis defines a notion of causal dependence between events, which plays a central role in his theory (1973b).

> (2) Where *c* and *e* are two distinct possible events, *e* causally depends on *c* if and only if *c* occurs $\Box\!\!\rightarrow$ *e* occurs and *c* does not occur $\Box\!\!\rightarrow$ *e* does not occur.

This condition states that whether *e* occurs or not depends on whether *c* occurs or not. Where *c* and *e* are actual occurrent events, this truth condition can be simplified somewhat. For in this case it follows from the second formal condition on the comparative similarity relation that the counterfactual "*c* occurs $\Box\!\!\rightarrow$ *e* occurs" is automatically true: this formal condition implies that a counterfactual with true antecedent and

true consequent is itself true. Consequently, the truth condition for causal dependence becomes:

> (3) Where *c* and *e* are two distinct actual events, *e* causally depends on *c* if and only if *c* does not occur □→ *e* does not occur.

The right hand side of this condition is, of course, Hume's second definition of causation. Lewis's official definition of causation differs from it, for he defines causation not in terms of causal dependence directly, but in terms of chains of causal dependence.

There are two immediate things to note about the definition of causal dependence. First, it takes the primary relata of causal dependence to be *events*. Lewis's own theory of events (1986b) construes events as classes of possible spatiotemporal regions. However, very different conceptions of events are compatible with the basic definition. Indeed, it even seems possible to formulate it in terms of facts rather than events. (For instance, see Mellor (1996).) Secondly, the definition requires the causally dependent events to be *distinct* from each other. This qualification is important if spurious non-causal dependences are to be ruled out. (For this point see J. Kim (1973).) For it may be that your saying "Hello" loudly depends on your saying "Hello"; and your writing "Larry" depends on your writing "Lar". But neither dependence counts as a causal dependence since the paired events are not distinct from each other.

2.2 The Temporal Asymmetry of Causal Dependence

What constitutes the direction of the causal relation? Why is this direction typically aligned with the temporal direction from past to future? In answer to these questions, Lewis argues (1979) that the direction of causation is the direction of causal dependence; and it is typically true that events causally depend on earlier events but not on later events. He emphasises the contingency of the latter fact because he regards backwards or time-reversed causation as a conceptual possibility that cannot be ruled out *a priori*. Accordingly, he dismisses any analysis of counterfactuals that would deliver the temporal asymmetry by conceptual fiat.

Lewis's explanation of the temporal asymmetry of counterfactual dependence is based on a *de facto* asymmetry about the actual world. He defines a *determinant* for an event as any set of conditions jointly sufficient, given the laws of nature, for the event's occurrence. (Determinants of an event may be causes or traces of the event.) He observes it is contingently true that events typically have very few earlier determinants but very many later determinants. For example, a spherical wavefront expanding outwards from a point source is a process where each sample of the wave postdetermines what happens at the point at which the wave is emitted. The opposite process in which a spherical wave contracts inward with each sample of wave predetermining what happens at the point the wave is absorbed would obey the laws of nature, but seldom happens in actual fact.

Lewis combines this *de facto* asymmetry of overdetermination with his analysis of the comparative similarity relation (1979). According to this analysis, the most similar worlds are those in which the

actual laws of nature are never violated. But exact similarity with respect to particular matters of facts in some spatiotemporal region is also an important aspect of similarity if it can be achieved at the cost of a small, local miracle, but not at the cost of a big, diverse miracle. There is no built-in time bias in this account. That comes only when it is combined with the asymmetry of overdetermination.

To see how the two parts combine consider the famous example of Nixon and the Nuclear Holocaust. An early objection to Lewis's account of counterfactuals (K. Fine (1975)) was that, counterintuitively, it makes this counterfactual false:

> (4) If Nixon had pressed the button, there would have been a nuclear war.

The argument is that a world in which Nixon pressed the button, but some minute violation of the laws then prevented a nuclear war, is much more like the actual world than one in which Nixon pressed the button and a nuclear war took place. Lewis replies (1979) that this does not accord with his account of the similarity relation. On this account, a button-pressing world that diverges from the actual world by virtue of a miracle is more like the actual world than a button-pressing world that converges with the actual world by virtue of a miracle. For in view of the asymmetry of overdetermination, the divergence miracle that allows Nixon to press the button need only be a small, local miracle, but the convergence miracle required to wipe out the traces of Nixon's pressing the button must be a very big, diverse miracle. Of course, if the asymmetry of overdetermination went in the opposite temporal direction, the very same standards of similarity would dictate the opposite verdict.

In general, then, the symmetric analysis of similarity, combined with the *de facto* asymmetry of overdetermination, implies that it is easier to reconcile a hypothetical change in the actual course of events by preserving the past and allowing for a divergence miracle rather than shielding the future from change by having a convergence miracle. This fact in turn implies that, where the asymmetry of overdetermination obtains, the present counterfactually depends on the past, but not on the future.

2.3 Transitivity and Preemption

Lewis says that though causal dependence between actual events is sufficient for causation, it is not necessary (1973b). Counterfactual dependence is not transitive, so it can happen that three actual events *c*, *d* and *e* are such that *d* would not have occurred without *c*, and *e* would not have occurrred without *d*, but *e* would still have occurred without *c*. We consider an example shortly. Nonetheless, Lewis insists that causation is transitive so that *c* must be a cause of *e* if *c* is a cause of *d* and *d* is a cause of *e*.

To overcome this problem he extends causal dependence to a transitive relation in the usual way by taking its ancestral. He defines a *causal chain* as a finite sequence of actual events *c, d, e*,... where *d* depends causally on *c*, *e* on *d*, and so on throughout the sequence. Then causation is finally be defined in these terms:

(5) *c* is a cause of *e* if and only if there exists a causal chain leading from *c* to *e*.

This definition has the virtue of killing two birds with one stone. Not only does it ensure the transitivity of causation, but it also appears to solve an additional problem to do with preemption that is illustrated by the following example. Suppose that two crack marksmen conspire to assassinate a hated dictator, agreeing that one or other will shoot their victim on a public occasion. Acting side-by-side, assassins *A* and *B* find a good vantage point, and, when the dictator appears, both take aim. *A* pulls his trigger and fires a shot that hits its mark, but *B* desists from firing when he sees *A* pull his trigger. Here assassin *A*'s actions are the actual cause of the dictator's death, while *B*'s actions are a preempted potential cause. (Lewis distinguishes these cases from cases of symmetrical overdetermination in which two processes terminate in the effect, with neither process preempting the other. Lewis believes that these cases are not suitable test cases for a theory of causation since they do not elicit clear judgements.) The problem seems to be that both actions are on a par from the point of view of causal dependence: if neither *A* nor *B* acted, then the dictator would not have died; and if either had acted without the other, the dictator would have been killed.

However, given the definition of causation in terms of causal chains, Lewis is able to distinguish the preempting actual cause from the preempted potential cause. There is a causal chain running from *A*'s actions to the dictator's death. For consider the intermediary event occurring between *A*'s taking aim and the dictator's death: the bullet in mid-trajectory. The bullet's trajectory depends causally on *A*'s action and the dictator's death depends causally on the bullet's trajectory. Hence, we have a causal chain, and so causation. But no corresponding intermediary can be found between *B*'s actions and the dictator's death; and so for this reason *B*'s actions do not count as an actual cause of the death.

2.4 Chancy Causation

So far we have considered how the counterfactual theory of causation works under the assumption of determinism. But what about causation when determinism fails? Lewis (1986c) argues that chancy causation is a conceptual possibility that must be accommodated by a theory of causation. Indeed, contemporary physics tells us the actual world abounds with probabilistic processes that are causal in character. To take a familiar example (1986c): suppose that you mischievously hook up a bomb to a radioactive source and geiger counter in such a way that the bomb explodes when the counter registers a certain number of clicks. If it happens that the counter registers the required number of clicks and the bomb explodes, your act caused the explosion, even though there is no deterministic connection between them.

In order to accommodate chancy causation, Lewis (1986c) defines a more general notion of causal dependence in terms of chancy counterfactuals. These counterfactuals are of the form *A* o-> *Pr* (*C*) = *x*, where the counterfactual is an ordinary world-counterfactual, interpreted according to the semantics above, and the *Pr* operator is a probability operator with narrow scope confined to the consequent of the counterfactual. Lewis interprets the probabilities involved as temporally indexed single-case chances. (See his (1980) for the theory of single-case chance).

The more general notion of causal dependence reads:

> (6) Where *c* and *e* are distinct events, *e* causally depends on *c* if and only if, if *c* had not occurred, the chance of *e*'s ocurring would have been much less than it actually was (given that *c* occurred).

This definition covers cases of deterministic causation in which the chance of the effect with the cause is 1 and the chance of the effect without the cause is 0. But it also allows for cases of irreducible probabilistic causation where these chances can take non-extreme values. It is similar to the central notion of probabilistic relevance used in probabilistic theories of causation, except that it employs chancy counterfactuals rather than conditional probabilities. (See the discussion in Lewis (1986c) for the advantages of the counterfactual approach over the probabilistic one.)

The rest of the theory of chancy causation follows the outlines of the theory of deterministic causation. Causal dependence is extended to a transitive notion by taking its ancestral. As before, we have causation when we have one or more steps of causal dependence.

3. Problems for Lewis's Counterfactual Theory

In this section we consider the principal difficulties for Lewis's theory that have emerged in discussion over the last twenty years.

3.1 Context-sensitivity

One relatively overlooked aspect of the concept of causation is its sensitivity to contextual factors. In so far as Lewis's theory overlooks this context-sensitivity, it represents a problem for the theory.

The theory assumes that causation is an absolute relation whose nature does not vary from one context to another. (This follows from the way the counterfactuals that define the central notion of causal dependence are governed by a unique, context-invariant system of weighted respects of similarity.) According to the theory, any event but for which an effect would not have occurred is one of the effect's causes. But this generates some absurd results. For example, suppose a person develops lung cancer as a result of years of smoking. It is true that if he had not smoked he would not have got lung cancer. But it is also true that if he had not possessed lungs or had not been born, he would not have got lung cancer. Commonsense draws a distinction between causes and background conditions, ranking the person's

smoking among the former and the person's birth and possession of lungs among the latter.

In their seminal work *Causation in the Law* (1965; 2nd ed 1985), H. L. A. Hart and A. Honor argue that the distinction between causes and conditions is relative to context in at least two different ways. One form of relativity might be called relativity to the context of occurrence. If a building is destroyed by fire, the presence of oxygen would be cited as a mere condition of the building's destruction. On the other hand, if a fire breaks out in a laboratory where oxygen is deliberately excluded, it may be appropriate to cite the presence of oxygen as a cause of the fire. The second form of relativity might be called relativity to the context of enquiry. For example, the cause of a great famine in India may be identified by the Indian peasant as the drought, but the World Food Authority may identify the Indian government's failure to build up reserves as the cause, and the drought as a mere condition.

For the most part, Lewis ignores these subtle context-sensitive distinctions. In his view (1986d), every event has an objective causal history consisting of a vast structure of events ordered by causal dependence. The human mind may select parts of the causal history for attention, perhaps different parts for different purposes of enquiry. However, Lewis does not specify the 'principles of invidious selection' by which some parts of the causal history are selected for attention, except to mention the relevance of Grice's maxims of conversation. But Grice's maxims of conversation are not well suited to explaining the context-sensitive distinctions involved in our causal judgements. As many philosophers have pointed out (A. Garfinkel (1981); C. Hitchcock (1996); P. Lipton (1990); J. Woodward (1984); and B. Van Fraassen (1981)), the contextual principles behind our causal judgements seem to rely on considerations concerning which class of situations the effect is contrasted with. As general principles of rational information exchange, Grice's maxims miss out on these causation-specific principles. (For discussion of the relevance of contrastive explanation to the causes/conditions distinction see Menzies (2001).)

3.2 Temporal Asymmetry

There have been several important critical discussions of Lewis's explanation of the temporal asymmetry of causation. (See P. Horwich (1987, Chap. 10); H. Price (1992) and (1996, Chap. 6); and D. Hausman (1998, Chap. 6).)

One kind of criticism has focused on the psychological implausibility of Lewis's explanation. (See Horwich (1987).) Recall that the explanation appeals, on the one hand, to a system of weighted respects of similarity between possible worlds that is delivered by *a priori* conceptual analysis and, on the other hand, to an asymmetry of overdetermination that is established *a posteriori* as a contingent truth about the actual world. The two-part explanation is supposed to employ facts that are sufficiently well known to play a role in the explanation of our linguistic use of counterfactuals. However, it is psychologically implausible that the intricate system of weighted respects of similarity involving comparison of miracles of different sizes could capture the intuitive similarity relation used in counterfactual reasoning. Why should we have developed such a baroque notion of similarity? Moreover, the asymmetry of overdetermination is an esoteric scientific finding that is not common knowledge to everyone using counterfactuals. Long before the discovery of the asymmetry of overdetermination, our ancestors used

counterfactuals and assumed their temporal asymmetry. So it is very unlikely that this scientific finding could account for their mastery of this aspect of the use of counterfactuals. (For Lewis's reply to this criticism see Postscript E to "Counterfactual Dependence and Time's Arrow" in his (1986a, p. 66).)

Another criticism is that the *de facto* asymmetry of overdetermination is not sufficiently extensive to constitute the objective basis for the temporal asymmetry of causal dependence. Lewis concedes this asymmetry is a contingent feature of the actual world which may not obtain in other worlds. For example, in a simple world inhabited by a single atom, the asymmetry of overdetermination fails to obtain. Convergence to this world takes no more of a varied and widespread miracle than divergence from it, so that counterfactuals about what happens in this world are not temporally asymmetric. However, Lewis's use of the asymmetry of overdetermination has been criticised on the grounds that it fails not only in simple worlds of this kind but also in the actual world. (See Price (1992) and (1996).) This asymmetry, like the related fork asymmetry (correlated events typically have an earlier common cause but seldom a later common effect), is a product of thermodynamic asymmetries. The example of radiation that Lewis offers as a paradigm of the asymmetry of overdetermination depends on the fact that the sources of radiation stem from big disturbances in the initial conditions, but not in the final conditions of the system in question. If the system were a closed system in thermodynamic equilibrium, there would be no asymmetry. This means that the asymmetry of overdetermination, as a feature of thermodynamic disequilibrium, is a large-scale, statistical asymmetry, appearing at the macroscopic but not mircoscopic level. However, the commonplace judgement of physicists is that microphysical processes are causal and temporally asymmetric in character. In view of the failure of the asymmetry of overdetermination at the microscopic level, Lewis's theory is powerless to explain this fact.

3.3 Transitivity

As we have seen, Lewis builds transitivity into causation by defining it in terms of chains of causal dependence. However, a number of counter-examples have been presented which cast doubt on transitivity. (Lewis (2001a) presents a short catalogue of these counterexamples.).

Here is an example due to Michael McDermott (1995). *A* and *B* each have a switch in front of them, which they can move to the left or right. If both switches are thrown into the same position, a third person *C* receives a shock. *A* does not want to shock *C*. Seeing *B*'s switch in the left position, *A* moves her switch to the right. *B* does want to shock *C*. Seeing *A*'s switch thrown to the right, she now moves her switch to the right as well. *C* receives a shock. Clearly, *A*'s throwing her switch to the right causes *B* to throw her switch to the right, which in turn causes *C* to receive the shock. But *A* attempted to prevent the shock so that it seems unreasonable to say that *A*'s move causes *C* to be shocked.

Here is one more example, due to Ned Hall (2001). A person is walking along a mountain trail, when a boulder high above is dislodged and comes careering down the mountain slopes. The walker notices the boulder and ducks at the appropriate time. The careering boulder causes the walker to duck and this, in turn, causes his continued stride. (This second causal link involves *double prevention*: the duck prevents the collision between walker and boulder which, had it occurred, would have prevented the walker's

continued stride.) However, the careeering boulder is the sort of thing that would prevent the walker's continued stride and so it seems counterintuitive to say that it causes the stride.

Lewis has noted (2000) that all counterexamples to transitivity have a common structure. An event *c* occurs that initiates a process that threatens to prevent some later event *e*. However, *c* also causes another event *d* which cuts short the threatening process but also causes *e* to occur anyway. (Hall (2000), while noting this common structure, also observes that examples involving double prevention have distinctive features which make them easier to deflect as counterexamples to transitivity.)

The strategy Lewis adopts in his (2000) is to defend transitivity by diagnosing the sources of our inclination to accept them. For example, he points out that the examples typically involve a structure in which a *c*-type event generally prevents an *e*-type but in the particular case the *c*-event actually causes another event that causes the *e*-event. If we mix up questions of what is generally conducive to what, with questions about what caused what in this particular case, he says, we may think that it is reasonable to deny that *c* causes *e*. But if we keep the focus sharply on the particular case, we must insist that *c* does in fact cause *e*.

3.4 Preemption

As we have seen, Lewis employs his strategy of defining causation in terms of chains of causal dependence not only to make causation transitive, but also to deal with preemption examples. However, there are preemption examples that this strategy cannot deal with satisfactorily. Difficulties concerning preemption have proven to be the biggest bugbear for Lewis's theory.

In his (1986c), Lewis distinguishes cases of *early* and *late preemption*. In early preemption examples, the process running from the preempted alternative is cut short before the main process running from the preempting cause has gone to completion. The example of the two assassins, given above, is an example of this sort. The theory of causation in terms of chains of causal dependence can handle this sort of example. In contrast, cases of late preemption are ones in which the process running from the preempted cause is cut short only after the main process has gone to completion and brought about the effect. The following is an example of late preemption due to Hall (2001).

Billy and Suzy throw rocks at a bottle. Suzy throws first so that her rock arrives first and shatters the glass. Without Suzy's throw, Billy's throw would have shattered the bottle. However, Suzy's throw is the actual cause of the shattered bottle, while Billy's throw is merely a preempted potential cause. This is a case of late preemption because the alternative process (Billy's throw) is cut short after the main process (Suzy's throw) has actually brought about the effect.

Lewis's theory cannot explain the judgement that Suzy's throw was the actual cause of the shattering of the bottle. For there is no causal dependence between Suzy's throw and the shattering, since even if Suzy had not thrown her rock, the bottle would have shattered due to Billy's throw. Nor is there a chain of stepwise dependences running cause to effect, because there is no event intermediate between Suzy's

throw and the shattering that links up them into a chain of dependences. Take, for instance, Suzy's rock in mid-trajectory. Certainly, this event depends on Suzy's initial throw, but the problem is that the shattering of the bottle does not depend on it, because even without it the bottle would still have shattered because of Billy's throw.

To be sure, the bottle shattering that would have occurred without Suzy's throw would be very different from the bottle shattering that actually occurred with Suzy's throw. For a start, it would have occurred later. Following Lewis, let us call an event *fragile* to the extent that it could not have occurred at a different time, or in a different manner. One response to the problem of late preemption is to insist that the events involved should be construed as fragile events. Accordingly, it will be true rather than false that if Suzy had not thrown her rock, then the actual bottle shattering, taken as a fragile event with an essential time and manner of occurrence, would not have occurred. Lewis himself does not endorse this response on the grounds that a uniform policy of construing events as fragile would go against our usual practices, and would generate many spurious causal dependences. For example, suppose that a poison kills its victim more slowly and painfully when taken on a full stomach. Then, the victim's eating dinner before he drinks the poison would count as a cause of his death since the time and manner of the death depend on the eating of the dinner. (See his (1986c) for discussion.)

When we turn from preemption examples involving deterministic causation to those involving chancy causation, we see that the problems for Lewis's theory multiply. One particularly recalcitrant problem is described in Menzies (1989). (See also J. Woodward (1990).) Suppose that two systems can produce the same effect, perhaps at the same time and in the same manner. (It does not matter whether this is an example of early or late preemption.) However, one system is much more reliable than the other. The reliable system starts and, left to itself, will very probably produce the effect. But you do not leave it to itself. You throw a switch that shuts down the reliable system and turns on the unreliable one. As luck would have it, the unreliable system works and brings about the effect. This kind of example presents a problem for the probabilistic generalisation of the counterfactual theory because the preempting actual cause decreases the chance of the effect while the preempted potential cause increases its chance. In addition to the problem of explaining how the preempting cause qualifies as a cause when the effect does not causally depend on it, the probabilistic counterfactual theory faces the problem of explaining how the preempted cause is not really a cause when the effect does causally depend on it.

4. Recent Developments

In this section we shall consider some recent developments of the counterfactual approach to causation, which have been motivated by the desire to overcome the deficiencies in Lewis's 1973 theory, especially with respect to preemption.

4.1 Lewis's 1999 Theory

In an attempt to deal with the various problems facing his 1973 theory, Lewis has recently presented a revised version of the theory. The new version was first presented in his Whitehead Lectures at Harvard University in March 1999. (For the lectures see his (2001); a shortened version has appeared as his (2000).)

Counterfactuals play as central a role in the new theory as in the old. But the counterfactuals it employs do not simply state dependences of *whether* one event occurs on *whether* another event occurs. The counterfactuals state dependences of *whether*, *when*, and *how* one event occurs on *whether*, *when*, and *how* another event occurs. A key idea in the formulation of these counterfactuals is that of an *alteration* of an event. This is an actualised or unactualised event that occurs at a slightly different time or in a slightly different manner from the given event. An alteration is, by definition, a very fragile event that could not occur at a different time, or in a different manner without being a different event. Lewis stipulates that one alteration of an event is the very fragile version that actually occurs.

The central notion of the new theory is that of influence.

> (7) Where *c* and *e* are distinct events, *c influences e* if and only if there is a substantial range of *c*1, *c*2, ... of different not-too-distant alterations of *c* (including the actual alteration of *c*) and there is a range of *e*1, *e*2, ... of alterations of *e*, at least some of which differ, such that if *c*1 had occurred, *e*1 would have occurred, and if *c*2 had occurred, e2 would have occurred, and so on.

Where one event influences another, there is a pattern of counterfactual dependence of whether, when, and how upon whether, when, and how. As before, causation is defined as an ancestral relation.

> (8) *c causes e* if and only if there is a chain of stepwise influence from *c* to *e*.

One of the points Lewis advances in favour of this new theory is that it handles cases of late as well as early pre-emption. (The theory is restricted to deterministic causation and so does not address the example of probabilistic preemption described in section 3.4.) Reconsider, for instance, the example of late preemption involving Billy and Suzy throwing rocks at a bottle. The theory is supposed to explain why Suzy's throw, and not Billy's throw, is the cause of the shattering of the bottle. If we take an alteration in which Suzy's throw is slightly different (the rock is lighter, or she throws sooner), while holding fixed Billy's throw, we find that the shattering is different too. But if we make the same alterations to Billy's throw while holding Suzy's throw fixed, we find that the shattering is unchanged.

Another point in favour of the new theory is that it handles a type of preemption Lewis calls *trumping*. (Trumping was discovered by Jonathan Schaffer: see his (2000).) Lewis gives an example involving a major and a sergeant who are shouting orders at the soldiers. The major and sergeant simultaneously

shout "Advance"; the soldiers hear them both and advance. Since the soldiers obey the superior officer, they advance because the major orders them to, not because the sergeant does. So the major's command preempts or trumps the sergeant's. Where other theories have difficulty with trumping cases, Lewis's argues his new theory handles them with ease. Altering the major's command while holding fixed the sergeant's, the soldier's response would be correspondingly altered. In contrast, altering the sergeant's command, while holding fixed the major's, would make no difference at all.

There is, however, some reason for scepticism about whether the new theory handles the examples of late preemption and trumping completely satisfactorily. In the example of late preemption, Billy's throw has some degree of influence on the shattering of the bottle. For if Billy had thrown his rock earlier (so that it preceded Suzy's throw) and in a different manner, the bottle would have shattered earlier and in a different manner. Likewise, the sergeant's command has some degree of influence on the soldiers' advance in that if the sergeant had shouted earlier than the major with a different command, the soldiers would have obeyed his order. In response to these points, Lewis must say that these alterations of the events are too-distant to be considered relevant. But some metric of distance in alterations is required, since it seems that similar alterations of Suzy's throw and the major's command are relevant to their having causal influence.

It has also been argued that the new theory generates a great number of spurious instances of causation. (For discussion see J. Collins (2000); I. Kvart (2001); and P. Dowe (2001).) The theory implies that any event that influences another event to a certain degree counts as one of its causes. But commonsense is more discriminating about causes. To take an example of Jonathan Bennett (1987): rain in December delays a forest fire; if there had been no December rain, the forest would have caught fire in January rather than when it actually did in February. The rain influences the fire with respect to its timing, location, rapidity, and so forth. But commonsense denies that the rain was a cause of the *fire*, though it allows that it is a cause of the *delay* in the fire. Similarly, in the example of the poison victim discussed above, the victim's ingesting poison on a full stomach influences the time and manner of his death (making it a slow and painful death), but commonsense refuses to countenance his eating dinner as a cause of his death, though it may countenance it as a cause of its being a slow and painful death. *Pace* Lewis, commonsense does not take anything that affects the time and manner of an event to be a cause of the event *simpliciter*.

4.2 Causation as Intrinsic Relation

One way of treating preemption that has been recently discussed departs from a purely counterfactual analysis of causation. It has been argued that preemption examples highlight the intuitive idea that causation is an intrinsic relation between events, which is to say it is a local relation depending on the intrinsic properties of the events and what goes on between them, and nothing else. The proferred treatments of preemption marry this intuitive idea with a crucial deployment of counterfactuals.

At one time Lewis himself resorts to this way of treating late preemption examples when he invoked the notion of *quasi-dependence*. (See his (1986c).) To explain this notion consider a case that resembles the

case of Billy and Suzy throwing rocks at a bottle. Suzy throws a rock and shatters the bottle in exactly the same way in which she does in the original case. But in this case Billy and his rock are entirely absent. Lewis argued that since the process in the original case and the process in the comparison case are intrinsically alike (and also obey the same laws), both or neither must be causal. However, the comparison process is surely a causal process since, thanks to Billy's absence, it exhibits a causal dependence. Accordingly, the process in the original case must be a causal process too, even though it does not exhibit a causal dependence. In such examples Lewis has said that the actual process that does not exhibit causal dependence is, nonetheless, causal by courtesy: it exhibits *quasi-dependence* in virtue of its intrinsic resemblance to the causal process in the comparison case.

A related idea is pursued in Menzies (1996 and 1999). Menzies argues that there is an element in our concept of causation that resists capture in purely counterfactual terms. This element consists in the idea that causation is a structural relation that underlies and supports causal dependences. This idea can be captured by treating the concept of causation as the concept of a theoretical entity. Applying a standard treatment of theoretical concepts, he argues that causation should be defined as the unique occupant of a certain characteristic role given by the platitudes of the folk theory of causation. One platitude is that causation is an intrinsic relation between events. Another platitude is that it is *typically*, but not invariably, accompanied by causal dependence. Accordingly, causation is defined in the following way:

> (9) *c* causes *e* if only if the intrinsic relation that typically accompanies causal dependence holds between *c* and *e*.

On this account, causation is not constituted by causal dependence. It is, in fact, a distinct relation for which causal dependence is, at best, a defeasible marker. The relation may be identified *a posteriori* with some physically specificable relation such as energy-momentum transfer. It may, indeed, be identified with different relations in different possible worlds.

This definition is supposed to explain commonsense intuitions about preemption examples. For example, Suzy's throw, and not Billy's throw, caused the shattering of the bottle, because the intrinsic relation that typically accompanies causal dependence connects Suzy's throw, but not Billy's throw, with the shattering of the bottle.

Lewis has since rejected his approach to preemption via quasi-dependence in favour of his current theory in terms of influence. (See his (2001a; 2001b).) He now claims that theories of causation as an intrinsic relation do not do justice to the full range of our intuitions about causation. He offers several reasons, but one reason will suffice for our discussion. He notes that the intuition that causation is an intrinsic matter does not apply to cases of double prevention. Consider a case of double prevention due to Hall (2001). A fighter is escorting a bomber on a raid. The pilot of the fighter shoots down an interceptor that would otherwise have shot down the bomber. The fighter pilot's action counts as a cause of the successful bombing because the action prevented something that would have prevented the bombing. Lewis observes that the causation in such cases of double prevention is partly an extrinsic matter. If the interceptor had been about to receive a radio order to return to base without attacking the bomber, the

fighter pilot's action would not have been a cause of the bombing. Moreover, he notes that much of the spatiotemporal region between the pilot's shooting down of the interceptor and the successful bombing is simply empty so that there is no chain of events to serve as a connecting process between cause and effect. The intuition that causation is an intrinsic relation does not apply in this case. More generally, he argues that theories of causation as an intrinsic relation are overhasty generalisations of one specific kind of causation, and they fail to do justice to our intuitions about causation involving absences (as causes, effects or intermediaries).

Events

Broadly understood, events are things that happen -- things such as births and deaths, thunder and lightening, explosions, weddings, hiccups and hand-waves, dances, smiles, walks. Whether such things form a genuine metaphysical category is a question that has attracted the sustained interest of philosophers, especially in the second half of the 20th century. But there is little question that human perception, action, language, and thought manifest at least a *prima facie* commitment to entities of this sort:

- Pre-linguistic infants appear to be able to discriminate and "count" events. The content of adult perception, especially in the auditory realm, endorses the discrimination and recognition *as events* of some aspects of the perceived scene.
- Humans (and arguably other animals) form the intention to plan and execute actions, and to bring about changes in the world.
- Dedicated linguistic devices (such as verb tenses and aspects, nominalization of some verbs, certain proper names) are tuned to events and event structures, as opposed to entities and structures of other sorts.
- Thinking about the temporal, causal, and intentional aspects of the world seems to require parsing those aspects in terms of events and their descriptions.

It is not clear to what extent such commitments are to be understood as an integrated phenomenon or as four separate, independent dispositions. However, there exist significant signs of convergence among the various commitments. For instance, the events that are perceived appear to be categorically homogeneous with those that are talked about or thought of in causal explanations [Zacks *et al*. 2001].

Because the *prima facie* commitments of human perception, action, language, and thought are not taken for granted in philosophy, various forms of non-realism about events have been defended. Historically, the main arguments *in favor* of a realist attitude towards events has arisen out of theories concerning the metaphysics of the scientific image of the world [Whitehead 1919] and the semantics of natural language [Davidson 1967a]. But even in these contexts events have been introduced as questionable categories, meant to be somewhat in competition with (if not alternative to) entities of other sorts. This suggests that in spite of the apparent simplicity of the examples in our initial list, the event category is not uncontroversial.

As a matter of fact, it is not even easy to give an uncontroversial *characterization* of events. (Their broad characterization as ‘things that happen’ is commonly found in dictionaries, but it clearly just shifts the

burden to the task of clarifying the meaning of 'happen'.) One useful approach is to set events against entities belonging to other, philosophically more familiar, metaphysical categories. In the following we review the main contrasts between events and those categories that have in the literature been put forward explicitly as their ontological competitors, or at least as categories exhibiting significant differences with the category of events. Along the way, we shall review also the main conceptual tools that metaphysicians and other philosophers have adopted in their attempts to cope with events, either from a realist or from a non-realist perspective.

---

1. Events and Other Categories

1.1 Events vs. Objects

Although not undisputed, some standard differences between events and physical objects are commonplace in the philosophical literature. First, there is a difference in mode of being: material objects such as stones and chairs are said to *exist*; events are said to *occur* or *happen* or *take place* [Hacker 1982a]. Second, there are differences in the way objects and events are said to relate to space and time. Ordinary objects have relatively clear spatial boundaries and unclear temporal boundaries; events have relatively unclear spatial boundaries and clear temporal boundaries. Objects are invidiously located in space -- they *occupy* their spatial location; events tolerate co-location [Quinton 1979, Hacker 1982b]. Objects can move; events cannot [Dretske 1967]. Objects are continuants -- they are *in* time and they persist through time by being wholly present at every time at which they exist; events are occurrents -- they *take up* time and they persist by having different parts (or "stages") at different times [Mellor 1980].

The last distinction is particularly controversial, as there are philosophers who conceive of objects as four-dimensional entities that extend across time just as they extend across space. Some such philosophers would in fact draw no metaphysically significant distinction between objects and events [Quine 1960]. Rather, they would regard the relevant distinction as one of degree: both objects and events would be species of the same "material inhabitant of space-time" genus (as opposed to the genus "immaterial inhabitant", such as the Equator); but whereas events appear to develop quickly in time, objects are relatively "firm and internally coherent" [Quine 1970].

If a metaphysical distinction between objects and events is granted, then a question arises as to the relation between entities in the two categories. Objects are prime actors in events; objectless events are uncommon. But so are eventless objects; events make up the lives of objects. In a radical mood, however, one can think of the entities in one category as being metaphysically dependent on entities in the other. For instance, it has been claimed that events supervene on their participants [Lombard 1986], or that objects depend on the events in which they partake [Parsons 1991]. In a more moderate way, one can grant objects and events an equal ontological status but maintain that either objects or events are primary in the order of thought. For instance, it has been claimed that a pure event-based ontology would not be sufficient for the success of our re-identifying practices, which require some stable frame of reference, adequately provided by objects [Strawson 1959]. A similar asymmetry between objects and events seems to be endorsed by natural language, which has expressions such as ‘the fall of the apple’ but not ‘the pomification of the fall’. However, these asymmetries may be attenuated to the extent that objects, too, may and sometimes must be identified via reference to events [Moravcsik 1965, Davidson 1969, Tiles 1981].

1.2 Events vs. Facts

No matter what their relationships, events are naturally contrasted with objects insofar as both are conceived of as *individuals*. Both appear to be concrete, temporally and spatially located entities organized into part-whole hierarchies. Both can be counted, compared, quantified over, referred to, and variously described and re-described. (It has been argued that our conceptions of these two categories are so closely tied as to be structurally complementary, in that any characterization of the concept *event* that only mentions spatial and temporal features yields a characterization of the concept *object* by a simple replacement of temporal with spatial predicates, and vice versa [Mayo 1961].) From this point of view, events are to be distinguished from facts, which are characterized by features of abstractness and a-temporality: the event of Caesar's death took place in Rome in 44 B.C., but that Caesar died is a fact here as in Rome, today as in 44 B.C. [Ramsey 1927]. One could indeed speculate that for every event there is a companion fact (the fact that the event took place), but the two would still be categorially distinct [Bennett 1988]. Some philosophers, however, have conceived of the link between events and facts as being much closer than this -- close enough to justify assimilating the two categories [Wilson 1974] or at least treating both as species of the same "state of affairs" genus [Chisholm 1970]. This has two main consequences. On the one hand, because facts corresponding to non-equivalent propositions are distinct, events conceived of as facts are fine-grained entities that cannot be freely re-described or re-identified under different conceptualizations: the fact that Caesar died violently is different from the fact that he

died, so the death of Caesar would be a different event from his violent death [Chisholm 1971]. On the other hand, because linguistic expressions of facts are semantically transparent, a Fregean line of argument could be concocted to show instead that events construed as facts are too coarse-grained, to the point of melting into a single "big" entity [Davidson 1967a]. (The argument is known as the "slingshot argument" since [Barwise & Perry 1981].) Either way, the assimilation of events to facts appears to give rise to difficulties.

Some authors have insisted on distinguishing events from facts but have given accounts that effectively amount to such an assimilation. This is the case with those theories that construe events as property exemplifications, i.e., exemplifications *of* properties *by* objects *at* times [Kim 1966, Martin 1969, Goldman 1970, Taylor 1985]. On such theories, events are individual entities. But because they have a structure, a difference in any constituent is sufficient to yield a different event. In particular, a difference in the relevant constitutive property is sufficient to distinguish events such as Caesar's death, construed as Caesar's exemplification of the property of dying, and Caesar's violent death, construed as his exemplification of the property of dying violently [Kim 1976]. This makes events virtually as fine-grained as facts. It bears emphasis, however, that this consequence is not intrinsic to the theory of events as property exemplifications. Both Caesar's death and his violent death could be construed as Caesar's exemplification of one and the same property *P*, describable both as a type of dying and -- with greater accuracy -- as a type of dying violently. Thus, even if construed as a structured complex, an event can be coarsely referred to insofar as its names need not be sensitive to this structure [Bennett 1988]. In this way the distinction between events and facts can be reinstated in terms of a firm distinction between semantic and metaphysical aspects of the theory of event-descriptions.

Similar considerations apply to those theories that treat events as situations, in the sense familiar from situation semantics [Barwise & Perry 1983]. On such theories, events are construed as sets of functions from spatiotemporal locations to "situation types" defined as sequences of objects standing or failing to stand in a certain relation. But while the formal machinery delivers a fine-grained account, the algorithm for applying the machinery to natural language sentences leaves room for flexibility.

1.3 Events vs. Properties

A third major metaphysical category with which events have sometimes been contrasted is that of properties. If events are individuals then they are not properties, for properties are normally construed as universals. Individuals occur whereas universals recur. However, some philosophers have taken very seriously the intuition that in some cases events may be said to recur, as when we say that the sun rises every morning. If so, then events are more similar to properties than to individuals, similar enough to justify treating them as a *kind* of property -- e.g., as properties of moments or intervals of time [Montague 1969], properties of cross-world classes of individuals [Lewis 1986], or properties of sets of world segments [von Kutschera 1993]. For instance, on the first of these accounts, the event of the sun's rising is the property of being an interval during which the sun rises. As a characterization of event types this would be uncontroversial and would allow one to construe particular events as tokens of the corresponding type. (One such construal would correspond to the above-mentioned conception of events as property exemplifications.) But to conceive of events as universal properties is to go beyond this

uncontroversial fact and to reject the existence of event tokens altogether, even when it comes to "particular" events such as the unique rising of the sun that we witnessed this morning. Rather than an instance of the universal *sun rising*, such an event would be a universal in its own right, albeit a universal of such a restricted sort and of such a degree of singularity as to be instantiated only once.

One possible view about properties is that they are not universals but rather particulars of a special sort -- viz. abstract particulars [Stout 1923] or *tropes* [Williams 1953]. According to this view, the redness of this apple is different from the redness of anything else, not because of its extreme singularity (other things could agree with the apple colorwise) but because it is the redness of *this* apple. It exists here and now, where and while the apple exists. Likewise, this morning's rising of the sun would be a different property than any other morning's rising of the sun. If so, then the view that events are properties becomes compatible with the view that they are spatiotemporally located. An event would just be a particularized property located at some region of space-time [Bennett 1996]. (Once again, this conception is closely related to the conception of events as property exemplifications, although the term ‘exemplification’ suggests a construal of properties as universals. Some authors actually identify the two conceptions [Bennett 1988]; others reject the identification on account of the difference between property instances and property exemplifications [Macdonald 1989].)

A variant of the trope conception construes events as trope sequences [Campbell 1981]. However, since tropes are particulars, a sequence of tropes at a place is itself a trope, hence this variant is best regarded as a specification of what sort of tropes events are.

1.4. Events vs. Times

The intuition that events are properties of times can also be fleshed out in terms of thinner metaphysical commitments, by construing events as times *cum description*, i.e., as temporal instants or intervals during which certain statements hold [Van Benthem 1983]. On this view, for example, this morning's rising of the sun is identified by an ordered pair $<i, \wp>$ where i is the relevant time period (corresponding to the descriptor ‘this morning’) and $\wp$ is the sentence ‘The sun rises’. Of course, this treatment does not do justice to some of the intuitions underlying the *prima facie* commitments to events -- for instance, events can be perceived but times cannot [Gibson 1975]. But because of the availability of fully developed theories of intervals along with fully developed interval-based semantics [Cresswell 1979, Dowty 1979], and because of equally well worked out traditional theories of instants and instant-based semantics [Prior 1967], such accounts are especially attractive from a reductionist perspective. (A more general account would construe events as *spatiotemporal* regions cum description, distinguishing e.g between this morning's rising of the sun in London and its rising in Paris.)

The link between events and times has also been explored in the opposite direction, though. If events are assumed as a primitive ontological category, then one can dispense with temporal instants or intervals and construe them as derived entities. The most classical treatment of this sort proceeds by construing temporal instants as maximal sets of pairwise simultaneous (or partially simultaneous) events [Russell 1914, Whitehead 1929, Walker 1947], but other treatments are possible. For example, it has been

suggested that the mathematical connection between the way events are perceived to be ordered and the underlying temporal dimension is essentially that of a free construction (in the category-theoretic sense) of linear orderings from event orderings, induced by the binary relation *x wholly precedes y* [Thomason 1989]. Treatments such as these provide a reduction of time in terms of relations among events and are therefore especially germane to a relational conception of time (and, more generally, of space-time). Modal variants [Forbes 1993] as well as mereological variants [Pianesi & Varzi 1996] of such views are also available.

2. Types of Events

2.1 Activities, Accomplishments, Achievements, and States

Philosophers who agree with a conception of events as particulars typically distinguish different sorts of such particulars. A classic typology distinguishes four sorts: activities, accomplishments, achievements, and states [Ryle 1949, Vendler 1957]. An *activity*, such as John's walking uphill, is a homogeneous event: its sub-events satisfy the same description as the activity itself and has no natural finishing point or culmination. An *accomplishment*, such as John's climbing the mountain, may have a culmination, but is never homogeneous. An *achievement*, such as John's reaching the top, *is* a culminating event (and is therefore always instantaneous). And a *state*, such as John's knowing the shortest way, is homogeneous and may extend over time, but it makes no sense to ask how long it took or whether it culminated. Sometimes accomplishments and achievements are grouped together into a single category of *performances* [Kenny 1963]. Sometimes achievements have also been called *events* tout court and all other events have been grouped together into a broadly understood category of temporally extended entities, called *processes* [Ingarden 1935]; the word '*eventuality*' may then be used as a label covering both categories [Bach 1986].

Some authors introduce aspectual considerations into the taxonomy, drawing on Aristotle's distinction between *Energeia* and *Kinêsis* [Ackrill 1965]. The idea is that different verbs describe different types of events: verbs with no continuous form ('know') correspond to states; verbs with continuous form for which the present continuous entails the past perfect ('John is walking uphill' entails 'John walked uphill') correspond to activities; and verbs for which the present continuous entails the negation of the past perfect ('John is climbing the mountain' entails 'John has not (yet) climbed the mountain', at least in the relevant context) correspond to performances [Mourelatos 1978]. Several authors have followed in these footsteps to develop linguistically sophisticated theories [Taylor 1977, Dowty 1979, Bach 1981, Galton 1984, Verkuyl 1989], but the legitimacy of drawing ontological categorizations from such linguistic distinctions has been questioned [Gill 1993].

2.2 Static and Dynamic Events

One may want to distinguish between *dynamic* events, such as John's walk, and *static* events, such as John's rest under a tree. According to some authors, the latter are not events proper because they do not

involve any change [Ducasse 1926]. In the most abstract construal, a change is an ordered pair of facts: the fact that obtains prior to the change and the fact that obtains after the change took place [von Wright 1963]. More substantial accounts of events as changes describe them as the exemplifications of dynamic properties, i.e., properties that an object has by virtue of a "movement" in some quality space [Lombard 1979]. However, the question of whether all events should be or involve changes of some sort has been found by most authors to be ultimately a matter of conceptual stipulation -- hence of little metaphysical import.

If static events are admitted, the question arises of whether they should be kept distinct from states [Parsons 1989]. One plausible assumption is that the distinction between the static and the dynamic aspects of the world is skew to the distinction between states and activities. As there may be static activities, so there may be dynamic states. Walking is a state of John's that is dynamic, as opposed to his state of resting, which is static. The walk itself is an activity of John's that is dynamic, as opposed to the rest John takes, which can be considered a static activity.

2.3 Actions and Bodily Movements

Prima facie, actions are categorized as a subclass of events, namely, animate events. Like all events, actions are said to occur or take place, not to exist, and their relation to time and space is event-like as well: they have relatively clear beginnings and endings but unclear spatial boundaries, they appear to tolerate co-location, and they cannot be said to move from one place to another or to endure from one time to another, but rather extend in space and time by having spatial as well as temporal parts [Thomson 1977]. Actions and events appear to be homogeneous in causal explanations, too: actions can be causes of which events are effects [Davidson 1967b]. Some authors, however, prefer to draw a distinction here and to treat actions as *relations* between agents and events, namely as instances of the relation of ‘bringing about’ that may hold between an agent and an event [von Wright 1963, Chisholm 1964, Bach 1980]. On such views, actions are not individuals unless relations are themselves construed as tropes.

Whether or not actions are treated as events, one might be tempted to distinguish between *actions* proper (such as John's raising his arm) and *bodily movements* (such as John's arm rising), or between *intentional* actions (John's walk) and *unintentional* ones (John's falling into a hole). For some authors this is necessary in order to explain important facts of human behavior [Brand 1984, Mele 1997]. However, it has been argued that such a distinction does not pertain to metaphysics but rather to the conceptual apparatus by means of which we describe the realm of things that happen. On this view, an arm raising is just an arm's rising under a mentalistic description [Anscombe 1957, 1979].

2.4 Mental and Physical Events

A similar story applies to the distinction between *mental* events (John's decision to wear boots) and *physical* or *physiological* events (such and such neurons firing). One may think that this distinction is real insofar as the latter events are expected to fall naturally into the nomological net of physical theory whereas the former seem to escape it. But one may also want to resist this line of thought and maintain

that the distinction between the mental and the physical concerns exclusively the vocabulary with which we describe what goes on. These options have important ramifications for various issues philosophy of mind -- e.g., issues of mental causation [Heil & Mele 1993]. If the distinction between mental and physical events is ontologically significant, then the question arises of how they causally interact with each other, leading to various forms of anomalous or nomological dualism [Foster 1991]. By contrast, the claim that the distinction is purely semantic is congenial to a monist position, whether nomological (e.g., reductive materialism) or anomalous [Macdonald 1989]. Anomalous monism has been popular especially among philosophers who accept a particularist conception of events as widely redescribable entities, for such a conception allows one to accept the materialist claim that all events are physical (regardless of whether one describes them in mentalistic terms) while rejecting the seeming consequence that mental goings-on can be given purely physical explanations (precisely because only a physicalistic vocabulary is suited to such an explanation, so that it is only under its physical description that a mental event can be seen to enter into causal relations) [Nagel 1965, Davidson 1970, 1993]. Some authors, however, have argued that this line of argument falls prey to the charge of epiphenomenalism [Honderich 1982, Kim 1993] and on such matters the debate is still quite open.

3. Existence, Identity, and Indeterminacy

As mentioned in the Introduction, one finds a *prima facie* commitment to events in various aspects of human perception, action, language, and thought. The main line of argument offered to back this commitment up, however, comes from considerations of logical form. Not only does ordinary talk involve explicit reference to and quantification over events, as when one says that *John's walk* was pleasant or that *two explosions* were heard last night. Ordinary talk also seems to advert implicitly to events through adverbial modification [Reichenbach 1947]. We say that Brutus stabbed Caesar with a knife. If this statement is taken to assert that a certain three-place relation obtains among Brutus, Caesar, and a knife, then it is hard to explain why our statement entails that Brutus stabbed Caesar (a statement that involves a different, two-place relation) [Kenny 1963]. By contrast, if we take our statement to assert that a certain event occurred (namely, a stabbing of Caesar by Brutus) *and* that it had a certain property (namely, of being done with a knife), then the entailment is straightforward [Davidson 1967a]. These reasons do not constitute a proof that there are such entities as events. But they are telling insofar as one is interested in an account of how it is that certain statements mean what they mean, where the meaning of a statement is at least in part determined by its logical relations to other statements. For another example, it has been argued that singular causal statements cannot be analyzed in terms of a causal connective (essentially for reasons having to do with the above mentioned slingshot argument) but rather require that causation be treated as a binary relation holding between individual events [Davidson 1967b]. Still a third example involves the semantics of perceptual reports with *naked infinitive* complements, as in ‘John saw Mary cry’, which is analyzed as ‘John saw an event which was a crying by Mary’ [Higginbotham 1983]. Many more such arguments have been offered, also by authors working within different programs in linguistics [Parsons 1990, Schein 1993, Rothstein 1998, Link 1998, Higginbotham *et al*. 2000, Tenny & Pustejovsky, 2000].

On the other hand, some philosophers have been dissatisfied with this sort of "existential proof" and have

argued instead that all talk that seems to involve explicit or implicit reference to or quantification over events can be paraphrased so as to avoid the commitment. For example, it has been argued that a term such as ‘John's walk’ goes proxy for the corresponding statement ‘John walked’ [Geach 1965], so to say that John's walk was pleasant is just to say that John walked pleasantly. Similar paraphrases have been offered to deal with the case of explicit quantifier-phrases such as ‘two explosions’ as well as with the implicit event quantification that lies behind adverb-dropping inferences [Clark 1970], singular causal statements [Horgan 1978], and so on. On the face of it, it appears that questions of logical form leave the existential issue undecided, at least insofar as an event-committing analysis automatically turns into an eliminativist paraphrase when read in the opposite direction (and vice versa).

Another issue that appears to be undecided is that of identity criteria, which has been the focus of an intense debate [Pfeifer 1989]. Is John's walk the same event as his pleasant walk? Was Brutus's stabbing of Caesar the same event as his killing of Caesar? Was it the same as the violent assassination of Caesar? Some philosophers take these to be metaphysical questions -- questions whose answers call for identity criteria, which must be provided before we are allowed to take our event talk seriously. Different conceptions of events tend to suggest different answers, and widely varying ones. At one extreme we find the radical "unifiers" (who take events to be as coarse-grained as objects [Quine 1950]), at the other the radical "multipliers" (who take events to be as fine-grained as facts [Kim 1966]). Other philosophers, however, regard questions of identity to be first and foremost semantic questions -- questions about the way we talk and about what we say. No metaphysical theory, it is said, can settle the semantics of ordinary event talk, hence there is no way of determining the truth or falsity of an event identity statement exclusively on the basis of one's metaphysical views. Which events a statement speaks of depends heavily (more heavily than with ordinary material objects) on local context and unprincipled intuitions [Bennett 1988]. If so, the whole identity issue is undecidable, since one is demanding metaphysical answers to questions that are in large part semantical.

4. Conclusion

One could take the massive indeterminacy that seems to surround the existence and identity issues to be evidence that systematic theorizing about events is impossible. On the other hand, it is not clear that the indeterminacy is any worse in the case of events than in the case of objects, and we seem able to theorize in a systematic fashion about them [Lombard 1998]. If that is right, then the indeterminacy in our event concept would seem to be no fatal hindrance to the development of systematic theorizing about events.

Action

If a person's head moves, she may or may not have moved her head, and, if she did move it, she may have actively performed the movement of her head or merely, by doing something else, caused a passive movement. And, if she performed the movement, she might have done so intentionally or not. This short array of contrasts (and others like them) has motivated questions about the nature, variety, and identity of action. Beyond the matter of her moving, when the person moves her head, she may be indicating agreement or shaking an insect off her ear. Should we think of the consequences, conventional or causal, of physical behavior as constituents of an action distinct from but 'generated by' the movement? Or should we think that there is a single action describable in a host of ways? Also, actions, in even the most minimal sense, seem to be essentially 'active'. But, how can we explain what this property amounts to and defend our wavering intuitions about which events fall in the category of the 'active' and which do not?

Donald Davidson [1980, essay 3] asserted that an action, in some basic sense, is something an agent does that was 'intentional under some description,' and many other philosophers have agreed with him that there is a conceptual tie between genuine action, on the one hand, and intention, on the other. However, it is tricky to explicate the purported tie between the two concepts. First, the concept of 'intention' has various conceptual inflections whose connections to one another are not at all easy to delineate, and there have been many attempts to map the relations between intentions for the future, acting intentionally, and acting with a certain intention. Second, the notion that human behavior is often intentional under one description but not under another is itself hard to pin down. For example, as Davidson pointed out, an agent may intentionally cause himself to trip, and the activity that caused the tripping may have been intentional under that description while, presumably, the foreseen but involuntary tripping behavior that it caused is not supposed to be intentional under any heading. Nevertheless, both the tripping and its active cause are required to make it true that the agent intentionally caused himself to trip. Both occurrences fall equally, in that sense, 'under' the operative description. So further clarification is called for.

There has been a notable or notorious debate about whether the agent's reasons in acting are causes of the action -- a longstanding debate about the character of our common sense explanations of actions. Some philosophers have maintained that we explain why an agent acted as he did when we explicate how the agent's normative reasons rendered the action intelligible in his eyes. Others have stressed that the concept of 'an intention with which a person acted' has a teleological dimension that does not, in their view, reduce to the concept of 'causal guidance by the agent's reasons.' But the view that reason explanations are somehow causal explanations remains the dominant position. Finally, recent discussions have raised important new questions about the force of normative reasons for action in the context of the

agent's practical deliberation and related questions about the rational role these reasons have in moving him to act.

1. The Nature of Action and Agency

It has been common to motivate a central question about the nature of action by invoking an intuitive distinction between the things that merely *happen* to people -- the events they undergo -- and the various things they genuinely *do*. The latter events, the doings, are the *acts* or *actions* of the agent, and the problem about the nature of action is supposed to be: what distinguishes an action from a mere happening or occurrence? For some time now, however, there has been a better appreciation of the vagaries of the verb 'to do' and a livelier sense that the question is not well framed. For instance, a person may cough, sneeze, blink, blush, and thrash about in a seizure, and these are all things the person has, in some minimal sense, 'done,' although in the usual cases, the agent will have been altogether passive throughout these 'doings.' It is natural to protest that this is not the sense of "do" the canny philosopher of action originally had in mind, but it is also not so easy to say just what sense that is. Moreover, as Harry Frankfurt [1978] has pointed out, the purposeful behavior of animals constitutes a low-level type of 'active' doing. When a spider walks across the table, the spider *directly controls* the movements of his legs, and they are directed at taking him from one location to another. Those very movements have an aim or purpose for the spider, and hence they are subject to a kind of teleological explanation. Similarly, the idle, unnoticed movements of my fingers may have the goal of releasing the candy wrapper from my grasp. All this behavioral *activity* is 'action' in some fairly weak sense.

Nevertheless, a great deal of human action has a richer psychological structure than this. An agent performs activity that is directed at a goal, and commonly it is a goal the agent has adopted on the basis of an overall practical assessment of his options and opportunities. Moreover, it is immediately available to the agent's awareness both that he is performing the activity in question and that the activity is aimed by him at such-and-such a chosen end. At a still more sophisticated conceptual level, Frankfurt [1988, 1999] has also argued that basic issues concerning freedom of action presuppose and give weight to a concept of 'acting on a desire with which the agent *identifies*.' Under Frankfurt's influence on this point, a good deal has been written to elucidate the nature of 'full-blooded' human agency, whether the notion is finally delineated either in Frankfurt's way or along different but related lines [see Velleman 2000, essay 6, Bratman 1999, essay 10]. Thus, there are different levels of action to be distinguished, and these include at least the following: unconscious and/or involuntary behavior, purposeful or goal directed activity (of Frankfurt's spider, for instance), intentional action, and the autonomous acts or actions of self-

consciously active human agents. Each of the key concepts in these characterizations raises some hard puzzles.

1.1 Knowledge of one's own actions.

It is frequently noted that the agent has some sort of *immediate awareness* of his physical activity and of the goals that the activity is aimed at realizing. In this connection, Elizabeth Anscombe [1963] spoke of 'knowledge without observation.' The agent knows 'without observation' that he is performing certain bodily movements (perhaps under some rough but non-negligible description), and he knows 'without observation' what purpose(s) the behavior is meant to serve [see also Falvey 2000]. Anscombe's discussion of her claim is rich and suggestive, but her conception of 'knowledge through observation' is problematic. Surely, one wants to say, propioception and kinesthetic sensation play some role in informing the agent of the positions and movements of his body, and it is uncertain why these informational roles should fail to count as modes of inner 'observation' of the agent's own overt physical behavior. What Anscombe explicitly denies is that agents generally know of the positions or movements of their own bodies by means of 'separably describable sensations' that serve as criteria for their judgements about the narrowly physical performance of their bodies. However, when a person sees that there is a goldfinch in front of him, his knowledge is not derived as an inference from the 'separably describable' visual impressions he has in seeing the goldfinch, but this is an instance of knowledge through observation nonetheless.

In a related vein, David Velleman [1989] described this knowledge as 'spontaneous,' i.e., as knowledge that the agent has achieved without deriving it from evidence adequate to warrant it. However, it is not so plain that an agent's knowledge that certain of his movements have been guided by him toward an objective *O* are not derived from prior evidence, reached by him on the basis of a simple causal inference. That is, he knows, in an immediate, first person way, that he is committed to objective *O* as his goal. In addition, he knows, also immediately, that those movements are caused -- causally guided, as it were -- by the state of having *O* as his goal then. If these points are correct, it may be that an agent knows his present goals and intentions without inner or outer evidence, but it may also be that this same non-observational, non-inferential knowledge itself serves as evidence for his further belief that his current behavior is directed at a such-and-such goals. In the same way, an agent can often identify right off, apparently without consulting evidence at all, what action it is that he will perform *next*. Again, it may be that all that the individual agent really knows immediately is that he has an intention to do so-and-so next, and the knowledge that he is actually on the verge of doing so-and-so is grounded for him in an inference that takes his intention for the near future as its primary epistemic ground [see Wilson 2000, Moran 2001].

These considerations, if right, would mean that one's knowledge of what one is presently doing and one's knowledge of what one is about to do are not spontaneous, in Velleman's suggested sense. And yet, at this juncture, the issues are intertwined with difficult questions about the nature of intentions and their relations to first-person beliefs about one's forthcoming actions. Velleman and others reject the picture of evidential support sketched just above, maintaining that the agent's belief that he will shortly *F* is contemporaneous with and embodied in his intention to *F*. It cannot be, therefore, that his knowledge of

his intention to *F* provides the grounds from which his expectation of imminent *F*ing has been derived. The tangle of issues here merits additional unweaving in future research.

1.2 Governance of one's own actions.

It is also important to the concept of 'goal directed action' that agents normally implement a kind of *direct* control or guidance over their own behavior. An agent may guide her paralyzed left arm along a certain path by using her active right arm to shove it through the relevant trajectory. The moving of her right arm, activated as it is by the normal exercise of her system of motor control, is a genuine action, but the movement of her left arm is not. That movement is merely the causal upshot of her guiding action, just as the onset of illumination in the light bulb is the mere effect of her action when she turned on the light. The agent has direct control over the movement of the right arm, but not over the movement of the left. And yet it is hardly clear what 'direct control of behavior' can amount to here. It does not simply mean that behavior *A*, constituting a successful or attempted *F*ing, was initiated and causally guided throughout its course by a present-directed intention to be *F*ing then. Even the externally guided movement of the paralyzed left arm would seem to satisfy a condition of this weak sort. Alfred Mele [1992] has suggested that the intuitive 'directness' of the guidance of action *A* can partially be captured by stipulating that the action-guiding intention must trigger and sustain *A proximally*. In other words, it is stipulated that the agent's present-directed intention to be *F*ing should govern action *A*, but not by producing some other prior or concurrent action *A** that causally controls *A* in turn. But the proposal is dubious. On certain assumptions, most ordinary physical actions are liable to flunk this strengthened requirement. The normal voluntary movements of an agent's limbs are caused by complicated contractions of suitable muscles, and the muscle contractions, since they are aimed at causing the agent's limbs to move, may themselves count as causally prior human actions. For instance, on Davidson's account of action they will since the agent's muscle contracting is intentional under the description 'doing something that causes the arm to move' [see Davidson 1980, essay 2]. Thus, the overt arm movement, in a normal act of voluntary arm moving, *will* have been causally guided by a prior action, the muscle contracting, and consequently the causal guidance of the arm's movement will fail to be an instance of 'proximal' causation at all [see Sehon 1998].

As one might imagine, this conclusion depends upon how an act of moving a part of one's body is to be conceived. Some philosophers maintain that the movements of an agent's body are never actions. It is only the agent's direct *moving* of, say, his leg that constitutes a physical action; the leg movement is merely caused by and/or incorporated as a part of the act of moving [see Hornsby 1980]. This thesis re-opens the possibility that the causal guidance of the moving of the agent's leg by the pertinent intention *is* proximal after all. The intention proximally governs the moving, if not the movement, where the act of moving is now thought to start at the earliest, inner stage of act initiation. Still, this proposal is also controversial. For instance, J.L. Austin [1962] held that the statement

> (1) The agent moved his leg

is ambiguous between (roughly)

(1′) The agent caused his leg to move

and the more specific

(1″) The agent performed a movement with his leg.

If Austin is right about this, then the nominalization “the agent’s moving of his leg” should be correspondingly ambiguous, with a second reading that denotes a certain leg movement, a movement the agent has *performed*. Thus, no simple appeal to a putative distinction between ‘movement’ and ‘moving’ will easily patch up the conception of ‘direct control of action’ under present scrutiny.

In any event, there is another well-known reason for doubting that the ‘directness’ of an agent’s governance of his own actions involves the condition of causal proximality -- that an action is not to be controlled by still another action of the same agent. Some philosophers believe that the agent’s moving his leg is triggered and sustained by the agent’s *trying* to move his leg in just that way, and that the efficacious trying is itself an action [see Hornsby 1980, Ginet 1990, and O’Shaughnessy 1973, 1980]. If, in addition, the agent’s act of leg moving is distinct from the trying, then, again, the moving of the leg has not been caused proximally by the intention. The truth or falsity of this third assumption is linked with a wider issue about the individuation of action that has also been the subject of elaborate discussion.

Donald Davidson [1980, essay 1], concurring with Anscombe, held that

(2) If a person *F*s *by G*ing, then her act of *F*ing = her act of *G*ing.

In Davidson’s famous example, someone alerts a burglar by illuminating a room, which he does by turning on a light, which he does in turn by flipping the appropriate switch. According to the Davidson/Anscombe thesis above, the alerting of the burglar = the illuminating of the room = the turning on of the light = the flipping of the switch. And this is so despite the fact that the alerting of the burglar was unintentional while the flipping of the switch, the turning on of the light, and the illuminating of the room were intentional. Suppose now that it is also true that the agent moved his leg *by* trying to move his leg in just that matter. Combined with the Davidson/Anscombe thesis about act identification, this implies that the agent’s act of moving his leg = his act of trying to move that leg. So, perhaps the act of trying to move the leg doesn’t cause the act of moving after all, since they are just the same.

The questions involved in these debates are potentially quite confusing. First, it is important to distinguish between phrases like

(a) the agent’s turning on the light

and gerundive phrases such as

(b) the agent's turning on of the light.

Very roughly, the expression (a) operates more like a 'that' clause, viz.

(a′) that the agent turned on the light,

while the latter phrase appears to be a definite description, i.e.,

(b′) the turning on of the light [performed] by the agent.

What is more, even when this distinction has been drawn, the denotations of the gerundive phrases often remain ambiguous, especially when the verbs whose nominalizations appear in these phrases are causatives. No one denies that there is an internally complex process that is initiated by the agent's switch-flipping hand movement and that is terminated by the light's coming on as a result. This process includes, but is not identical with, the act that initiates it and the event that is its culminating upshot. Nevertheless, in a suitable conversational setting, the phrases (b) and (b′) can be properly used to designate any of the three events: the act that turned on the light, the onset of illumination in the light, and whole process whereby the light has come to be turned on. [For further discussion, see Parsons 1990, Pietrofsky 2000, and Higgenbotham 2000].

Now, the Davidson-Anscombe thesis plainly is concerned with the relation between the agent's *act* of turning on the light, his *act* of flipping the switch, etc. But which configuration of events, either prior to or contained within the extended causal process of turning on the light, really constitutes the agent's action? Some philosophers have favored the overt arm movement the agent performs, some favor the extended causal process he initiates, and some prefer the relevant event of trying that precedes and 'generates' the rest. It has proved difficult to argue for one choice over another without simply begging the question against competing positions. As noted before, Hornsby and other authors have pointed to the intuitive truth of

(3) The agent moved his arm *by* trying to move his arm,

and they appeal to the Davidson-Anscombe thesis to argue that the act of moving the arm = the *act* of trying to move the arm. On this view, the act of trying -- which *is* the act of moving -- causes a movement of the arm in much the same way that an act of moving the arm causes the onset of illumination in the light. Both the onset of illumination and the overt arm movement are simply causal consequences of the act itself, the act of trying to move his arm in just this way. Further, in light of the apparent immediacy and strong first person authority of agents' judgements that they have tried to do a certain thing, it appears that acts of trying are intrinsically mental acts. So, a distinctive type of mental act stands as the causal source of the bodily behavior that validates various physical re-descriptions of the act.

And yet none of this seems inevitable. It is arguable that

(4) The agent tried to turn on the light

simply means, as a first approximation at least, that

(4′) The agent *did something* that was directed at turning on the light.

Moreover, when (4) or (4′) is true, then the something the agent did that was directed at turning on the light will have been some other causally prior action, the act of flipping the switch, for example. If this is true of trying to perform basic acts (e.g., moving one's own arm) as well as non-basic, instrumental acts, then trying to move one's arm may be nothing more than doing something directed at making one's arm move. In this case, the something which was done may simply consist in the contracting of the agent's muscles. Or, perhaps, if we focus on the classic case of the person whose arm, unknown to her, is paralyzed, then the trying in that case (and perhaps in all) may be nothing more than the activation of certain neural systems in the brain. Of course, most agents are not aware *that* they are initiating appropriate neural activity, but they are aware *of* doing something that is meant to make their arms move. And, in point of fact, it may well be that the something of which they are aware as a causing of the arm movement just is the neural activity in the brain. From this perspective, ‘trying to *F*’ does not name a natural kind of mental act that ordinarily sets off a train of fitting physical responses. Rather, it gives us a way of describing actions in terms of a goal aimed at in the behavior without committing us as to whether the goal was realized or not. It also carries no commitment,

i. concerning the intrinsic character of the behavior that was aimed at *F*ing,
ii. whether one or several acts were performed in the course of trying, and
iii. whether any further bodily effects of the trying were themselves additional physical actions [see Cleveland 1997].

By contrast, it is a familiar doctrine that what the agent does, in the first instance, in order to cause his arm to move is to form a distinctive mental occurrence whose intrinsic psychological nature and content is immediately available to introspection. The agent *wills* his arm to move or produces a *volition* that his arm is to move, and it is this mental willing or volition that is aimed at causing his arm to move. Just as an attempt to turn on the light may be constituted by the agent's flipping of the switch, so also, in standard cases, trying to move his arm is constituted by the agent's willing his arm to move. For traditional ‘volitionalism,’ willings, volitions, basic tryings are, in Brian O'Shaughnessy's apt formulation, ‘primitive elements of animal consciousness.’[1] They are elements of consciousness in which the agent has played an active role, and occurrences that normally have the power of producing the bodily movements they represent. Nevertheless, it is one thing to grant that, in trying to move one's body, there is some ‘inner’ activity that is meant to initiate an envisaged bodily movement. It is quite another matter to argue successfully that the initiating activity has the particular mentalistic attributes that volitionism has characteristically ascribed to acts of willing.

It is also a further question whether there is only a *single* action, bodily or otherwise, that is performed along the causal route that begins with trying to move and terminates with a movement of the chosen

type. One possibility, adverted to above, is that there is a whole causal chain of *actions* that is implicated in the performance of even the simplest physical act of moving a part of one's body. If, for example, 'action' is goal-directed behavior, then the initiating neural activity, the resulting muscle contractions, and the overt movement of the arm may *all* be actions on their own, with each member in the line-up causing every subsequent member, and with all of these actions causing an eventual switch flipping somewhere further down the causal chain. On this approach, there may be nothing which is *the* act of flipping the switch or of turning on the light, because each causal link is now an act which flipped the switch and (thereby) turned on the light [see Wilson 1989]. Nevertheless, there still will be a single *overt* action that made the switch flip, the light turn on, and the burglar become alert, i.e., the overt movement of the agent's hand and arm. In this sense, the proposal supports a modified version of the Davidson/Anscombe thesis.

However, all of this discussion suppresses a basic metaphysical mystery. In the preceding two paragraphs, it has been proposed that the neural activity, the muscle contractions, and the overt hand movements may all be actions, while the switch's flipping on, the light's coming on, and the burglar's becoming alert are simply happenings outside the agent, the mere effects of the agent's overt action. As we have seen, there is plenty of disagreement about where basic agency starts and stops, whether within the agent's body or somewhere on its surface. There is less disagreement that the effects of bodily movement beyond the body, e.g., the switch's flipping on, the onset of illumination in the room, and so on, are not, by themselves at least, purposeful actions. Still, what could conceivably rationalize *any* set of discriminations between action and non-action as one traces along the pertinent complex causal chains from the initial mind or brain activity, through the bodily behavior, to the occurrences produced in the agent's wider environment?

Perhaps, one wants to say, as suggested above, that the agent has a certain kind of direct (motor) control over the goal-seeking behavior of his own body. In virtue of that fundamental biological capacity, his bodily activity, both inner and overt, is governed by him and directed at relevant objectives. Inner physical activity causes and is aimed at causing the overt arm movements and, in turn, those movements cause and are aimed at causing the switch to flip, the light to go on, and the room to become illuminated. Emphasizing considerations of this sort, one might urge that they validate the restriction of action to events in or at the agent's body. And yet, the stubborn fact remains that the agent also does have a certain 'control' over what happens to the switch, the light, and even over the burglar's state of mind. It is a goal for the agent of the switch's flipping on that it turn on the light, a goal for the agent of the onset of illumination in the room that it render the room space visible, etc. Hence, the basis of any discrimination between minimal agency and non-active consequences within the extended causal chains will have to rest on some special feature of the person's guidance: the supposed 'directness' of the motor control, the immediacy or relative certainty of the agent's expectations about actions vs. results, or facts concerning the special status the agent's living body. The earlier remarks in this section hint at the serious difficulty of seeing how any such routes are likely to provide a rationale for grounding the requisite metaphysical distinction(s).

2. Intentional Action and Intention

Anscombe opened her monograph *Intention* by noting that the concept of 'intention' figures in each of the constructions:

> (5) The agent intends to *G*;
> (6) The agent *G*'d intentionally; and
> (7) The agent *F*'d with the intention of *G*ing,

For that matter, one could add

> (7′) In *F*ing (by *F*ing), the agent intended to *G*.

Although (7) and (7′) are closely related, they seem not to say quite the same thing. For example, although it may be true that

> (8) Veronica mopped the kitchen then with the intention of feeding her flamingo afterwards,

it normally won't be true that

> (8′) In (by) mopping the kitchen, Veronica intended to feed her flamingo afterwards.

Despite the differences between them, I will call instances of (7) and (7′) ascriptions of *intention in action*.[2] These sentential forms represent familiar, succinct ways of *explaining* action. A specification of the intention with which an agent acted or the intention that the agent had in acting provides a common type of explanation of why the agent acted as he did. This observation will be examined at some length in Section 3.

Statements of form (5) are ascriptions of *intention for the future*, although, as a special case, they include ascriptions of *present-directed intentions*, i.e., the agent's intention to be *G*ing *now*. Statements of form 6), ascriptions of *acting intentionally*, bear close connections to corresponding instances of (7). As a first approximation at least, it is plausible that (6) is true just in case

> (6′) The agent *G*'d with the intention of (thereby) *G*ing.

However, several authors have questioned whether such a simple equivalence captures the special complexities of what it is to *G* intentionally.[3] Here is an example adapted from Davidson [1980, essay 4]. Suppose that Betty kills Jughead, and she does so with the intention of killing him. And yet suppose also that her intention is realized only by a wholly unexpected accident. The bullet she fires misses Jughead by a mile, but it dislodges a tree branch above his head and releases a swarm of hornets that attack him and sting him until he dies. In this case, it is at least dubious that, in this manner, Betty has killed Jughead *intentionally*. (It is equally doubtful that Betty killed him *unintentionally* either.) Or

suppose that Reggie wins the lottery, and having bizarre illusions about his ability to control which ticket will win, he enters the lottery and wins it with the intention of winning it [Mele 1997]. The first example suggests that there needs to be some condition added to (6′) that says the agent succeeded in *G*ing in a manner sufficiently in accordance with whatever plan she had for *G*ing as she acted. The second suggests that the agent's success in *G*ing must result from her competent exercise of the relevant skills, and it must not depend too much on sheer luck, whether the luck has been foreseen or not. Various other examples have prompted additional emendations and qualifications [see Harman 1976].

There are still more fundamental issues about intentions in action and how they are related to intentions directed at the present and the immediate future. In "Actions, Reasons, and Causes," Davidson seemed to suppose that ascriptions of intention in action reduce to something like the following.

> (7*) The agent *F*'ed, and at that time he had a pro-attitude toward *G*ing and believed that by *F*ing he would or might promote *G*ing, and the pro-attitude in conjunction with the means-end belief caused his *F*ing, and together they caused it 'in the right way.'

(In Davidson's widely used phrase, the pro-attitude and associated means-end belief constitute a *primary reason* for the agent to *F*.) In this account of 'acting with an intention' there is, by design, no mention of a distinctive state of intending. Davidson, at the time of this early paper, seemed to favor a reductive treatment of intentions, including intentions for the future, in terms of pro-attitudes, associated beliefs, and other potential mental causes of action. In any case, Davidson's approach to intention in action was distinctly at odds with the view Anscombe had adopted in *Intention*. She stressed the fact that constructions like (7) and (7′) supply commonsense explanations of why the agent *F*'d, and she insisted that the explanations in question do not cite the agent's reasons as causes of the action. Thus, she implicitly rejected anything like (7*), the causal analysis of 'acting with a certain intention' that Davidson apparently endorsed. On the other hand, it was less than clear from her discussion how it is that intentions give rise to an alternative mode of action explanation.

Davidson's causal analysis is modified in his later article "Intending" [1980, essay 5]. By the time of this essay, he dropped the view that there is no primitive state of intending. Intentions are now accepted as irreducible, and the category of intentions is distinguished from the broad, diverse category that includes the various pro-attitudes. In particular, he identifies intentions for the future with the agent's all-out judgments (evaluations) of what she is to do. Although there is some lack of clarity about the specific character of these practical 'all-out' judgements, they play an important role in Davidson's overall theory of action, particularly in his striking account of weakness of will [1980, essay 2]. Despite his altered outlook on intentions, however, Davidson does not give up the chief lines of his causal account of intentions in action -- of what it is to act with a certain intention. In the modified version,

> (7**) The agent's primary reason for *G*ing must cause her, in the right way, to intend to *G*, and her intending to *G* must itself cause, again in the right way, the agent's particular act of *F*ing.[4]

The interpolated, albeit vague, conditions that require causation in ‘the right way’ are meant to cover well-known counterexamples that depend upon deviant causal chains occurring either in the course of the agent’s practical reasoning or in the execution of his intentions. Here is one familiar type of example. A waiter intends to startle his boss by knocking over a stack of glasses in their vicinity, but the imminent prospect of alarming his irascible employer unsettles the waiter so badly that he involuntarily staggers into the stack and knocks the glasses over. Despite the causal role of the waiter's intention to knock over the glass, he doesn't do this intentionally. In this example, where the deviant causation occurs as part of the performance of the physical behavior itself, we have what is known as ‘primary causal deviance.’ When the deviant causation occurs on the path between the behavior and its intended further effects -- as in the example of Betty and Jughead above -- the deviance is said to be ‘secondary.’ There have been many attempts by proponents of a causal analysis of intention in action (‘causalists,’ in the terminology of von Wright 1971) to spell out what ‘the right kind(s)’ of causation might be, but with little agreement about their success [see Bishop 1989, Mele 1997]. Some other causalists, including Davidson, maintain that no armchair analysis of this matter is either possible or required. However, most causalists agree with Davidson’s later view that the concept of ‘present directed intention’ is needed in any plausible causal account of intention in action and acting intentionally. It is, after all, the present directed intention that is supposed to guide causally the ongoing activity of the agent [see also Searle 1983].

The simplest version of such an account depends on what Michael Bratman has dubbed “the Simple View.” This is the thesis that proposition (6) above, [The agent *G*’d intentionally] and, correspondingly, proposition (7) [The agent *F*ed with the intention of *G*ing] entail that, at the time of action, the agent intended *to G*. Surely, from the causalist point of view, the most natural account of *G*ing intentionally is that the action of *G*ing is governed by a present directed intention whose content for the agent is, “I am *G*ing now.’ So the causalist’s natural account presupposes the Simple View, but Bratman [1984, 1987] has presented a well-known example to show that the Simple View is false. He describes a type of case in which the agent wants either to Φ or to Θ, without having any significant preference between the two alternatives. The agent does know, however, that it is flatly impossible, in the given circumstances, for him to *both* Φ and Θ although, in these same circumstances, it *is* open to him to try to Φ and try to Θ concurrently. (Perhaps, in trying to Φ, he does something with one hand, and, in trying to Θ, he does something with the other.) Believing that such a two-pronged strategy of trying to achieve each goal maximizes his chances of achieving his actual goal of either Φing or Θing, the agent actively aims at both of the subordinate ends, trying to accomplish one or the other. The example can be spelled out in such a way that it is clear that the agent is wholly rational, in his actions and attitudes, as he knowingly pursues this bifurcated attack on his disjunctive goal. Suppose now that the agent actually succeeds in, say, Φing and that he succeeds in virtue of his skill and insight, and not through some silly accident. So, the agent Φ’s intentionally. It follows from the Simple View that the agent intended to Φ. And yet, the agent was also doing something with the intention of Θing and had this attempt succeeded instead (without the intervention of too much luck), then the agent would have Θ’d intentionally. By a second application of the Simple View, it follows that he also intended to Θ. And yet, just as it is irrational to intend to Φ while believing that it is flatly impossible for him to Φ, so also does it seem irrational to have an intention to Φ *and* an intention to Θ, while believing that it is flatly impossible to do the two things together. So the agent here should be open to criticisms of irrationality in his endeavor to Φ or Θ. Nevertheless, we observed at the outset that he is not. The only way out is to block the conclusion that, in

trying to Φ and trying to Θ in these circumstances, the agent has the contextually irrational pair of intentions, and rejecting the Simple View is the most direct manner of blocking that conclusion.

Even if Bratman's argument defeats the Simple View [see McCann 1986], it doesn't rule out some type of causal analysis of acting intentionally; it doesn't even rule out such an analysis that takes the crucial controlling cause to be an intention in every instance. One might suppose, for example, that (i) in a Bratman case, the agent merely intends to *try* to Φ and intends to *try* to Θ, and that (ii) it is these intentions that drive the agent's actions [Mele 1997]. The analysis in (7**) would be modified accordingly. However, the project of finding a workable and non-circular emendation of (7**) remains an open question.

The conceptual situation is complicated by the fact that Bratman holds that (7) [The agent *F*'d with the intention of *G*ing] is ambiguous between

> The agent *F*'d with the aim or goal of *G*ing

and

> The agent *F*'d as part of a plan that incorporated an intention to *G*.

(8) above is an especially clear example in which the second reading is required. The second reading does entail that the agent intends to *F*, and it is only the first that, according to Bratman's argument, does not. Therefore, Bratman thinks that we need to distinguish intention as an aim or goal of actions and intention as a distinctive state of commitment to future action, a state that results from and subsequently constrains our practical endeavors as planning agents. It can be rational to aim at a pair of ends one knows to be jointly unrealizable, because aiming at both may be the best way to realize one or the other. However, it is not rational to plan on accomplishing both of two objectives, known to be incompatible, since intentions that figure in rational planning should agglomerate, i.e., should fit together in a coherent larger plan. Bratman's example and the various critical discussions of it have promoted important topics concerning the very idea of the *rationality* of actions and intentions, measured against the backdrop of the agent's beliefs and suppositions.

It has been mentioned earlier that Davidson came to identify intentions for the future with all out judgements about what the agent is to be doing now or should do in the relevant future. Velleman [1989], by contrast, identifies an intention with the agent's spontaneous belief, derived from practical reflection, which says that he is presently doing a certain act (or that he will do such an act in the future), and that his act is (or will be) performed precisely as a consequence of his acceptance of this self-referential belief. Paul Grice [1971] favored a closely related view in which intention consists in the agent's willing that certain results ensue, combined with the belief that they will ensue as a consequence of the particular willing in question. Hector-Neri Castañeda [1975], influenced by Sellars [1966] maintained that intentions are a special species of internal self-command, which he calls "practitions." Bratman [1987] develops a functionalist account of intention: it is the psychological state that plays a certain kind of

characteristic causal role in our practical reasoning, in our planning for the future, and in the carrying out of our actions. This causal role, he argues, is distinct from the characteristic causal or functional roles of expectations, desires, hopes, and other attitudes about the agent's future actions.

3. The Explanation of Action

For many years, the most intensely debated topic in the philosophy of action concerned the explanation of intentional actions in terms of the agent's reasons for acting. As stated previously, Davidson and other action theorists defended the position that reason explanations are causal explanations -- explanations that cite the agent's desires, intentions, and means-end beliefs as causes of the action [see Goldman 1970]. These causalists about the explanation of action were reacting against a neo-Wittgensteinian outlook that claimed otherwise. In retrospect, the very terms in which the debate was conducted were flawed. First, for the most part, the non-causalist position relied chiefly on negative arguments that purported to show that, for conceptual reasons, motivating reasons could not be causes of action. Davidson did a great deal to rebut these arguments. It was difficult, moreover, to find a reasonably clear account of what sort of non-causal explanation the neo-Wittgensteinians had in mind. Charles Taylor, in his book *The Explanation of Action* [1964], wound up claiming that reason explanations are grounded in a kind of 'non-causal bringing about,' but neither Taylor nor anyone else ever explained how any bringing about of an event could fail to be causal. Second, the circumstances of the debate were not improved by the loose behavior of the ordinary concept of 'a cause.' When someone says that John has cause to be offended by Jane's truculent behavior, then "cause" in this setting just means 'reason,' and the statement, "John was caused to seek revenge by his anger," may means nothing more than, "John's anger was among the reasons for which he sought revenge." If so, then presumably no one denies that reasons are *in some sense* causes. In the pertinent literature, it has been common to fall back on the qualified claim that reasons are not 'efficient' or 'Humean' or 'producing' causes of action. Unfortunately, the import of these qualifications has been less than perspicuous.

George Wilson [1989] and Carl Ginet [1990] follow Anscombe in holding that reason explanations are distinctively grounded in an agent's intentions in action. Both authors hold that ascriptions of intention in action have the force of propositions that say *of* a particular act of *F*ing that it was intended by its agent to *G* (by means of *F*ing), and they claim that such *de re* propositions constitute non-causal reason explanations of why the agent *F*ed on the designated occasion. Wilson goes beyond Ginet in claiming that statements of intention in action have the meaning of

> (9) The agent's act of *F*ing was directed by him at [the objective] of *G*ing,

In this analyzed form, the teleological character of ascriptions of intention in action is made explicit. Given the goal-directed nature of action, one can provide a familiar kind of teleological explanation of the relevant behavior by mentioning a goal or purpose of the behavior for the agent at the time, and this is the information (9) conveys. Or, alternatively, when a speaker explains that

> (10) The agent *F*'d because he wanted to *G*,

the agent's desire to *G* is cited in the explanation, not as a cause of the *F*ing, but rather as indicating a desired goal or end at which the act of *F*ing came to be directed.

Most causalists will allow that reason explanations of action are teleological but contend that teleological explanations in terms of goals -- purposive explanations in other words -- are themselves analyzable as causal explanations in which the agent's primary reason(s) for *F*ing are specified as guiding causes of the act of *F*ing. Therefore, just as there are causalist analyses of what it is to do something intentionally, so there are similar counterpart analyses of teleological explanations of goal directed and, more narrowly, intentional action. The causalist about teleological explanation maintains that the goal of the behavior for the agent just is a goal the agent had at the time, one that caused the behavior and, of course, one that caused it in the right way [for criticism, see Sehon 1998].

It has not been easy to see how these disagreements are to be adjudicated. The claim that purposive explanations do or do not *reduce* to suitable counterpart causal explanations is surprisingly elusive. It is not clear, in the first place, what it is for one form of explanation to reduce to another. Moreover, as indicated above, Davidson himself has insisted that it is not possible to give an explicit, reductive account of what 'the right kind of causing' is supposed to be and that none is needed. Naturally, he may simply be right about this, but others have felt that causalism about reason explanations is illicitly protected by endemic fuzziness in the concept of 'causation of the right kind.' Some causalists who otherwise agree with Davidson have accepted the demand for a more detailed and explicit account, and some of the proposed accounts get extremely complicated. Without better agreement about the concept of 'cause' itself, the prospects for a resolution of the debate do not appear cheerful. Finally, Abraham Roth [2000] has pointed out that reasons explanations might both be irreducibly teleological *and* also cite primary reasons as efficient causes at the same time. It is arguable that similar explanations, having both causal and teleological force, figure already in specifically homeostatic (feedback) explanations of certain biological phenomena. When we explain that the organism *V*ed *because* it needed *W*, we may well be explaining both that the goal of the *V*ing was to satisfy the need for *W and* that it was the need for *W* that triggered the *V*ing.

One of the principal arguments that were used to show that reason explanations of action could not be causal was the following. If the agent's explaining reasons *R* were among the causes of his action *A*, then there must be some universal causal law which nomologically links the psychological factors in *R* (together with other relevant conditions) to the *A*-type action that they rationalize. However, it was argued, there simply are no such psychological laws; there are no strict laws and co-ordinate conditions that ensure that a suitable action will be the invariant product of the combined presence of pertinent pro-attitudes, beliefs, and other psychological states. Therefore, reasons can't be causes. In "Actions, Reasons, and, Causes," Davidson first pointed out that the thesis that there are no reason-to-action laws is crucially ambiguous between a stronger and a weaker reading, and he observes that it is the stronger version that is required for the non-causalist conclusion. The weaker reading says that there are no reason-to-action laws in which the antecedent is formulated in terms of the 'belief/desire/intention' vocabulary of commonsense psychology and the consequent is stated in terms of goal directed and intentional action. Davidson accepted that the thesis, on this reading, is correct, and he has continued to accept it ever since.

The stronger reading says that there are no reason-to-action laws in any guise, including laws in which the psychological states and events are re-described in narrowly physical terms and the actions are re-described as bare movement. Davidson affirms that there *are* laws of this second variety, whether we have discovered them or not.[5]

Many have felt that this position only lands Davidson (*qua* causalist) in deeper trouble. It is not simply that we suppose that states of having certain pro-attitudes and of having corresponding means-end beliefs are among the causes of our actions. We suppose further that the agent did what he did because the having of the pro-attitude and belief were states with (respectively) a conative and a cognitive nature, and even more importantly, they are psychological states with certain propositional contents. The specific character of the causation of the action depended crucially on the fact that these psychological states had 'the direction of fit' and the propositional contents that they did. The agent *F*'ed at a given time, we think, because, at that time, he had a desire that represented *F*ing, and not some other act, as worthwhile or otherwise attractive to him.

Fred Dretske [1988] gave a famous example in this connection. When the soprano's singing of the aria shatters the glass, it will have been facts about the acoustic properties of the singing that were relevant to the breaking. The breaking does *not* depend upon the fact that she was singing lyrics and that those lyrics expressed such-and-such a content. We therefore expect that it will be the acoustic properties, and not the 'content' properties that figure in the pertinent explanatory laws. In the case of action, by contrast, we believe that the contents of the agent's attitudes *are* causally relevant to behavior. The contents of the agent's desires and beliefs not only help justify the action that is performed but, according to causalists at least, they play a causal role in determining the actions the agent was motivated to attempt. It has been difficult to see how Davidson, rejecting laws of mental content as he does, is in any position to accommodate the intuitive counterfactual dependence of action on the content of the agent's motivating reasons. His theory seems to offer no explication whatsoever of the fundamental role of mental content in reason explanations. Nevertheless, it should be admitted that no one really has a very good theory of how mental content plays its role. An enormous amount of research has been conducted to explicate what it is for propositional attitudes, realized as states of the nervous system, to express propositional contents at all. Without some better consensus on this enormous topic, we are not likely to get far on the question of mental causation, and solid progress on the attribution of content may still leave it murky how the contents of attitudes can be among the causal factors that produce behavior.

In a fairly early phase of the debate over the causal status of reasons for action, Norman Malcolm [1968] and Charles Taylor [1964] defended the thesis that ordinary reason explanations stand in potential rivalry with the explanations of human and animal behavior the neural sciences can be expected to provide. More recently, Jaegwon Kim [1989] has revived this issue in a more general way, seeing the two modes of explanation as joint instances of a Principle of Explanatory Exclusion. That Principle tells us that, if there exist two 'complete' and 'independent' explanations of the same event or phenomenon, then one or the other of these alternative explanations must be wrong. Influenced by Davidson, many philosophers reject more than just reason-to-action laws. They believe, more generally, that there are no laws that connect the reason-giving attitudes with *any* material states, events, and processes, under purely physical descriptions. As a consequence, commonsense psychology is not strictly reducible to the neural sciences, and this

means that reason explanations of action and corresponding neural explanations are, in the intended sense, 'independent' of one another. But, detailed causal explanations of behavior in terms of neural factors should also be, again in the intended sense, 'complete.' Hence, Explanatory Exclusion affirms that either the reason explanations or the prospective neural explanations must be abandoned as incorrect. Since we are not likely to renege upon our best, most worked-out scientific accounts, it is the ultimate viability of the reason explanations from commonsense 'vernacular' psychology that appear to be threatened. The issues here are complicated and controversial -- particularly issues about the proper understanding of 'theoretical reduction.' However, if Explanatory Exclusion applies to reason explanations of action, construed as causal, we have a very general incentive for searching for a workable philosophical account of reason explanations that construes them as non-causal. Just as certain function explanations in biology may not reduce to, but also certainly do not compete with, related causal explanations in molecular biology, so also non-causal reason explanations could be expected to co-exist with neural analyses of the causes of behavior.

In the foregoing, reference has been made to explanations of actions in terms of *reasons*, but recent work on agency has questioned whether contemporary frameworks for the philosophy of action have really articulated the way in which an agent's desires and other pro-attitudes have the distinctive force of reasons in the setting of these ordinary explanations [see Frankfurt 1988, 1999, Smith 1994]. Of course, it is widely recognized that reason explanations both tell us what motivated the agent's action and elucidate the justification that the action had, at least from the agent's own standpoint. However, the motivating role of 'reasons' can come to be separated from their role in providing an apparent justification. Compare the following two cases. In the first case, Smith hears some malicious gossip about the past career of Jones. Smith takes Jones to be a person with an absolutely impeccable character, and knows the rumor she has heard to be untrue. But, Smith's character is not so good. For a long time, she has felt a stifling envy of Jones, and, on this occasion, she has an irresistible, spiteful urge to repeat the defamatory false gossip and, thereby, damage Jones' exemplary reputation. Smith knows her desire for what it is -- a powerful but thoroughly unworthy urge to injure Jones. And she knows that it gives her no justifying reason, no justification whatsoever, for repeating the nasty gossip. In this case, however, Smith gives in to her jealous inclination, and passes the misinformation along. Now, when she tells the false story, Smith's behavior certainly does have a goal or purpose for her, and we can cite that goal or purpose in explaining why she acted as she did. But, as has been stipulated already, there is an important sense in which even Smith herself does not regard her desire as constituting any full-blooded ground or reason for what she does.

The contrasting case is much the same, but, in this case, Smith still has her envious impulses, but she is not subject to their control. Further, there is a central, new dimension to the character of Smith's practical reflections. She thinks that damaging Jones' unspotted reputation may do something to undermine the standing of a certain organization to which Jones belongs, and Smith seriously feels that there are grave political objections to this organization. She therefore believes that there would be real value in discrediting it. Smith may have her doubts about whether the envisaged end (discrediting the organization) justifies the choice of means (harming the innocent Smith). In this variant example, however, it seems that Smith can rightly think that her desire to hurt Jones' reputation constitutes a genuine reason -- constitutes at least some legitimate *prima facie* justification -- for injuring Jones' good

name. Now, most ordinary explanations of action in terms of reasons are more like the second case. The agent regards her potentially motivating pro-attitudes as providing intelligible grounds for action, and it is a key task of her practical reasoning to sort out the relative reason-giving force of the competing considerations.

The theory of action should be able to explain the differences between Smith's reasons and the import they have for her in the two contrasting cases. It should provide an account of why some teleological explanations of action are also explanations in terms of genuine normative reasons for acting and other purposive explanations are not. In this area, two fundamental questions seem to be linked closely with one another. What is it for a person or some other organism to be an agent of autonomous action? And, how do we explicate the special force of reasons for autonomous action in practical reasoning -- a 'force' quite different from the motivating impact of an overmastering desire? A good deal of attention has recently been devoted to these important problems and the associated issues they engender [see Korsgaard 1996, Bratman 1999, Velleman 2000, and Moran 2001]. Progress on such area questions may eventually reconfigure and improve the more established debates about how reason explanations do their work, including, one hopes, the venerable debate about whether reasons can be causes.

Notes to Action

Notes

1. O'Shaughnessy 1973, p. 67. In O'Shaughnessy 1980, the author significantly modifies his position on this and related matters. This latter work constitutes the best, most extended investigation of fundamental metaphysical questions about action. Cleveland 1997 provides an instructive critical discussion.

2. The phrase originates with Anscombe 1963, but it has been picked up by various authors, not always with clear agreement about its use. For a causalist interpretation, treating the content of intentions as self-referential, see, for example, Searle 1983.

3. It is more usual in the literature to evaluate, following a suggestion of Davidson's, the purported equivalence of 'The agent intentionally *G*'d' and 'The agent *G*'d for some reason.' Whatever differences there might be between this proposal and the one in the text do not affect the present discussion.

4. Davidson gives the most explicit endorsement of (7**), or some minor variant thereof, on p. 221 of his "Reply to Vermazen" in Vermazen and Hintikka 1985.

5. In his paper, "Mental Events" [1980, essay 11], his denial that there are reason to action laws framed in the psychological vocabulary of ordinary discourse takes on special emphasis, and it plays a key role in an original argument he constructs for the token/token identity of mental and physical states.

Donald Davidson

Donald Davidson is one of the most important philosophers of the latter half of the twentieth century. His ideas, presented in a series of essays from the 1960's onwards, have been influential across a range of areas from semantic theory through to epistemology and ethics. Davidson's work exhibits a breadth of approach, as well as a unitary and systematic character, which is unusual within twentieth century analytic philosophy. Thus, although he acknowledges an important debt to W. V. O. Quine, Davidson's thought amalgamates influences (though these are not always explicit) from a variety of sources, including Quine, C. I. Lewis, Frank Ramsey, Immanuel Kant and the later Wittgenstein. And while often developed separately, Davidson's ideas nevertheless combine in such a way as to provide a single integrated approach to the problems of knowledge, action, language and mind. The breadth and unity of his thought, in combination with the sometimes-terse character of his prose, means that Davidson is not an easy writer to approach. Yet however demanding his work might sometimes appear, this in no way detracts from either the significance of that work or the influence it has exercised and will undoubtedly continue to exercise. Indeed, in the hands of Richard Rorty and others, and through the widespread translation of his writings, Davidson's ideas have reached an audience that extends far beyond the confines of English-speaking analytic philosophy. Of contemporary American philosophers, perhaps only Quine has had a similar reception and influence.

Biographical Sketch

Born on March 6th, 1917, in Springfield, Massachusetts, USA, Donald Herbert Davidson completed his undergraduate study at Harvard, graduating in 1939. His early interests were in literature and classics and, as an undergraduate, Davidson was strongly influenced by A. N. Whitehead. After starting graduate

work in classical philosophy (completing a Master's degree in 1941), Davidson's studies were interrupted by service with the US Navy in the Mediterranean from 1942-45. He continued work in classical philosophy after the war, graduating from Harvard in 1949 with a dissertation on Plato's 'Philebus'. By this time, however, the direction of Davidson's thinking had already, under Quine's influence, changed quite dramatically (the two having first met at Harvard in 1939-40) and he had begun to move away from the largely literary and historical concerns that had preoccupied him as an undergraduate towards a more strongly analytical approach.

While his first position was at Queen's College in New York, Davidson spent much of the early part of his career (1951-1967) at Stanford University. He has subsequently held positions at Princeton (1967-1970), Rockefeller (1970-1976), and the University of Chicago (1976-1981). Since 1981 he has taught at the University of California, Berkeley. Davidson has also been the recipient of a number of awards and fellowships and, in 1970, was the John Locke Lecturer at the University of Oxford.

Action and Mind

Reasons as Causes

Much of Davidson's early work was in decision theory (see *Decision-Making: An Experimental Approach*, with P. Suppes and S. Siegel [1957]), and it was not until the early 1960's that the work for which he is best known began to appear in print. Indeed, Davidson's first major philosophical publication was the seminal paper 'Actions, Reasons and Causes' (1963). In that paper Davidson sets out to defend the view that the explanation of action by reference to reasons (something we do, for instance, when we refer to an agent's intentions or motives in acting) is also a form of causal explanation. Indeed, he argues that reasons explain actions just inasmuch as they are the causes of those actions. This approach was in clear opposition to the Wittgensteinian orthodoxy of the time. On this latter account causal explanation was viewed as essentially a matter of showing the event to be explained as an instance of some law-like regularity (as we might explain the whistling of a kettle by reference to certain laws involving, among other things, the behaviour of gases under pressure). Since rational explanation was held, in general, not to involve any such reference to laws, but rather required showing how the action fitted into some larger pattern of rational behaviour, explanation by reference to reasons was held to be distinct from and independent of explanation by reference to causes.

Although directed against the Wittgensteinian-inspired view that reasons cannot be causes, Davidson's argument nevertheless effectively redeploys a number of Wittgensteinian notions. Two ideas play an especially significant role in the Davidsonian account -- ideas that are also, in one form or another,

important in Davidson's thinking elsewhere. The first of these ideas is the notion of a 'primary reason' -- the pairing of a belief and a desire (or 'pro-attitude') in the light of which an action is explained. Thus, my action of flipping the light switch can be explained by reference to my having the *belief* that flipping the switch turns on the light in combination with my having the *desire* to turn on the light (for most explanations explicit reference to both the belief and the desire is unnecessary). An action is thus rendered intelligible through being embedded in a broader system of attitudes attributable to the agent -- through being embedded, that is, in a broader framework of *rationality*. The second idea is that of action 'under a description' (a phrase originally appearing in G. E. M. Anscombe's *Intention* [1959]). As with the concept of a primary reason the idea here is simple enough: one and the same action is always amenable to more than one correct description. This idea is especially important, however, as it provides a means by which the same item of behaviour can be understood as intentional under some descriptions but not under others. Thus my action of flipping the light switch can be redescribed as the act of turning on the light (under which it is intentional) and also as the act of alerting the prowler who, unbeknown to me, is lurking in the bushes outside (under which it is unintentional). Generalising this point we can say that the same event can be referred to under quite disparate descriptions: the event of alerting the prowler is the same event as my flipping the light switch which is the same event as my moving of my body (or a part of my body) in a certain way.

Davidson treats the connection between reason and action (where the reason is indeed *the* reason for the action) as a connection that obtains between two events (the agent's believing and desiring on the one hand and her acting on the other) that can be variously described. The connection is both rational, inasmuch as the belief-desire pair (the 'primary reason') specifies the reason for the action, but it is also causal, inasmuch as the one event causes the other if it is indeed the reason for it. It is precisely because the reason is causally related to the action that the action can be explained by reference to the reason. Indeed, where an agent has a number of reasons for acting, and yet acts on the basis of one reason in particular, there is no way to pick out just that reason on which the agent acts other than by saying that it is the reason that *caused* her action.

Understood as rational the connection between reason and action cannot be described in terms of any strict law. Yet inasmuch as the connection is also a causal connection, so there must exist some law-like regularity, though not describable in the language of rationality, under which the events in question fall (an explanation can be causal, then, even though it does not specify any strict law). Davidson is thus able to maintain that rational explanation need not involve explicit reference to any law-like regularity, while nevertheless also holding that there must be some such regularity that underlies the rational connection just inasmuch as it is causal. Moreover, since Davidson resists the idea that rational explanations can be formulated in the terms of a predictive science, so he seems committed to denying that there can be any reduction of rational to non-rational explanation.

The Anomalism of the Mental

The more developed argument for this latter claim, and for the more general position in the philosophy of mind, of which it forms a part, appears at a number of places in Davidson's work. The first and best-

known presentation is that of ‘Mental Events’ (1970) in which Davidson argues for the compatibility of three principles (all three of which are adumbrated in various ways in the argument of ‘Actions, Reasons and Causes’): (i) that at least some mental events interact causally with physical events -- *’The Principle of Causal Interaction’*; (ii) that events related as cause and effect fall under strict laws (that is, laws that are ‘precise, explicit and as exceptionless as possible’) -- *’The Principle of the Nomological Character of Causality’*; and (iii) that there are no strict laws (as opposed to mere generalisations) relating mental and physical events -- *’The Anomalism of the Mental’*. Of these principles the first two would ordinarily be held to be incompatible with the third, and to imply, not the ‘anomalism’ of the mental, but rather, in the case of mental and physical events related as cause and effect, the existence of strict laws relating those events. To argue, as does Davidson, for the compatibility of the original principles is thus also to argue for the truth of the third, that is, for the truth of anomalism monism.

Davidson holds that events are particulars such that the same event can be referred to under more than one description. He also holds that events that are causally related must be related under some strict law. However, since Davidson takes laws to be linguistic entities, so they can relate events only as those events are given under specific descriptions. Thus, as was already evident in Davidson’s approach to the theory of action, the same pair of events may instantiate a law under one description, but not under others. There is, for example, no strict law that relates, under just those descriptions, the formation of ice on the surface of a road to the skidding of a car on that road, and yet, under a different description (a description that will employ a completely different set of concepts), the events at issue will indeed be covered by some strict law or set of laws. But while nomological relations between events (relations involving laws) depend on the descriptions under which the events are given, relations of causality and identity obtain irrespective of descriptions -- if the icing-up of the road did indeed cause the skid, then it did so no matter how the events at issue are described. (The form of description -- whether mental or physical -- is thus irrelevant to the fact that a particular causal relation obtains). It follows that the same pair of events may be related causally, and yet, under certain descriptions (though not under all), there be no strict law under which those events fall. In particular, it is possible that a mental event -- an event given under some mental description -- will be causally related to some physical event -- an event given under a physical description -- and yet there will be no strict law covering those events *under just those descriptions*. My wanting to read Tolstoy, for instance, leads me to take *War and Peace* from the shelf, and so my wanting causes a change in the physical arrangement of a certain region of space-time, but there is no strict law that relates my wanting to the physical change. Similarly, while any mental event will be identical with some physical event -- it will indeed be one and the same event under two descriptions -- it is possible that there will be no strict law relating the event as described in mentalistic terms with the event as physically described. In fact, Davidson is explicit in claiming that there can be *no* strict laws that relate the mental and the physical in this way -- there is no strict law that relates, for instance, wanting to read with a particular kind of brain activity.

Davidson’s denial of the existence of any strict ‘psycho-physical’ laws follows from his view of the mental as constrained by quite general principles of rationality that do not apply, at least not in the same way, to physical descriptions: normative considerations of overall consistency and coherence, for instance, constrain our own thinking about events as physically described, but they have no purchase on physical events as such. This does not mean, of course, that there are no correlations whatsoever to be

discerned between the mental and the physical, but it does mean that the correlations that can be discerned cannot be rendered in the precise, explicit and exceptionless form -- in the form, that is, of strict laws -- that would be required in order to achieve any reduction of mental to physical descriptions. The lack of strict laws covering events under mental descriptions is thus an insuperable barrier to any attempt to bring the mental within the framework of unified physical science. However, while the mental is not reducible to the physical, every mental event can be paired with some physical event -- that is, every mental description of an event can be paired with a physical description of the very same event. This leads Davidson to speak of the mental as 'supervening' on the physical in a way that implies a certain dependence of mental predicates on physical predicates: predicate *p* supervenes on a set of predicates *S* 'if and only if *p* does not distinguish any entities that cannot be distinguished by *S*' (see 'Thinking Causes' [1993]). Put more simply, events that cannot be distinguished under some physical description cannot be distinguished under a mental description either.

On the face of it, anomalous monism appears a highly attractive way to think about the relation between the mental and the physical - inasmuch as it combines 'monism' with 'anomalism' so it seems to preserve what is important about physicalism while nevertheless retaining the ordinary language of so-called 'folk-psychology' (the language of beliefs and desires, actions and reasons). In fact anomalous monism has proved to be a highly contentious position drawing criticism from both physicalists and non-physicalists alike. The nomological conception of causality (the second of the three principles defended in 'Mental Events') has often been seen as something for which Davidson fails to supply any real argument (a criticism he has attempted to address in 'Laws and Cause' [1995]); the Davidsonian account of supervenience has been viewed as incompatible with other aspects of his position and sometimes as simply mistaken or confused; and, perhaps the most serious and widespread criticism, anomalous monism has been seen as making the mental causally inert. These criticisms have not, however, gone unanswered (see especially 'Thinking Causes'), and while Davidson has modified aspects of his position, he has continued to hold to, and to defend, the basic theses first made explicit in 'Mental Events'.

Problems of Irrationality

Davidson's commitment to the rationality of the mental as one of the cornerstones of anomalous monism (as well as to the account of 'radical interpretation' [see 'Meaning and Truth' below]) leads him to take a special interest in the problem of apparently irrational belief and action -- something first addressed in 'How is Weakness of the Will Possible?'(1970). While Davidson treats irrationality as a real feature of our mental lives, he offers a way of dealing with it that aims at preserving, in some sense, the overall rationality of the mind (see especially 'Two Paradoxes of Irrationality' [1982]). A belief or desire in the mind of one person can cause a belief or desire in the mind of another without this compromising the rationality of the mental. (Davidson's example is my growing of a beautiful flower because I desire you to enter my garden -- you develop a craving to see the flower as a result of my desire and my desire has thereby caused, without being a reason for, your craving) Davidson suggests that we should view the same sort of relation as sometimes holding within a single mind. To this end we should view the mind as weakly 'partitioned' so that different attitudes may be located within different 'territories' and need not, therefore, be taken to come into direct conflict.

Ontology and Logical Form

Davidson's accounts of action and of mind call upon a well-developed set of analyses concerning psychological concepts such as belief, desire and intention -- concepts whose analysis is taken further in a number of papers that follow on from, and develop or modify, the ideas first set out in 'Actions, Reasons and Causes' (papers such as 'Agency' (1971) and 'Intending' [1978]) as well as in Davidson's discussions of epistemological and semantic issues (see below). But Davidson 's work in this area is also dependent on his account of the notions of cause, event and law and, in particular, on his defence of the view that events are particulars and so constitute a fundamental ontological category. If events are indeed particulars then an important question concerns the conditions of identity for events. In 'The Individuation of Events' [1969] Davidson argues that events are identical if and only if they have exactly the same causes and effects. In 'Reply to Quine on Events' [1985] he abandons this criterion in favour of the Quinean suggestion that events are identical if and only if they occupy exactly the same location in space and time.

A characteristic feature of Davidson's approach to such ontological questions has been to focus on the logical structure of sentences about the entities at issue rather than on those entities as such. Davidson's approach to events, for instance, is grounded in an analysis of the underlying logical form of sentences about events; in the case of causal relations, in an analysis of the logical form of sentences that express such relations (see 'Causal Relations' [1967]); and in his approach to action also, Davidson's approach involves an analysis of the logical form of sentences about actions (see 'The Logical Form of Action Sentences' [1967]). This reflects a more general commitment on Davidson's part to the inseparability of questions of ontology from questions of logic. This commitment is spelt out explicitly in 'The Method of Truth in Metaphysics' (1977) and it provides a further point of connection between Davidson's work in the philosophy of action, event and mind and his work on questions of meaning and language.

Meaning and Truth

The Structure of a Semantic Theory

Although Davidson has written on a wide range of topics, a great deal of his work, particularly during the late 1960s and early 1970s, has focussed on the problem of developing an approach to the theory of meaning that will be adequate to natural language. The characteristic feature of Davidson's approach to this problem is his proposal that meaning is best understood via the concept of truth, and, more particularly, that the basic structure for any adequate theory of meaning is that given in a formal theory

of truth.

Davidson's thinking about semantic theory is developed on the basis of a holistic conception of linguistic understanding (see 'Truth and Meaning' [1967]). Providing a theory of meaning for a language is thus a matter of developing a theory that will enable us to generate, for every actual and potential sentence of the language in question, a theorem that specifies what each sentence means. On this basis a theory of meaning for German that was given in English might be expected to generate theorems that would explicate the German sentence 'Schnee ist weiss' as meaning that snow is white. Since the number of potential sentences in any natural language is infinite, a theory of meaning for a language that is to be of use to creatures with finite powers such as ourselves, must be a theory that can generate an infinity of theorems (one for each sentence) on the basis of a finite set of axioms. Indeed, any language that is to be learnable by creatures such as ourselves must possess a structure that is amenable to such an approach. Consequently, the commitment to *holism* also entails a commitment to a *compositional* approach according to which the meanings of sentences are seen to depend upon the meanings of their parts, that is, upon the meanings of the words that form the finite base of the language and out of which sentences are composed. Compositionality does not compromise holism, since not only does it follow from it, but, on the Davidsonian approach, it is only as they play a role in whole sentences that individual words can be viewed as meaningful. It is sentences, and not words, that are thus the primary focus for a Davidsonian theory of meaning. Developing a theory for a language is a matter of developing a systematic account of the finite structure of the language that enables the user of the theory to understand any and every sentence of the language.

A Davidsonian theory of meaning explicates the meanings of expressions holistically through the interconnection that obtains among expressions within the structure of the language as a whole. Consequently, although it is indeed a theory *of* meaning, a theory of the sort Davidson proposes will have no use for a concept of meaning understood as some discrete entity (whether a determinate mental state or an abstract 'idea') to which meaningful expressions refer. One important implication of this is that the theorems that are generated by such a theory of meaning cannot be understood as theorems that relate expressions and 'meanings'. Instead such theorems will relate sentences to other sentences. More particularly, they will relate sentences in the language to which the theory applies (the 'object-language') to sentences in the language in which the theory of meaning is itself couched (the 'meta-language') in such a way that the latter effectively 'give the meanings of' or translate the former. It might be thought that the way to arrive at theorems of this sort is to take as the general form of such theorems '*s* means that *p*' where *s* names an object-language sentence and *p* is a sentence in the meta-language. But this would be already to assume that we could give a formal account of the connecting phrase 'means that', and not only does this seem unlikely, but it also appears to assume a concept of meaning when it is precisely that concept (at least as it applies within a particular language) that the theory aims to elucidate. It is at this point that Davidson turns to the concept of truth. Truth, he argues, is a less opaque concept than that of meaning. Moreover, to specify the conditions under which a sentence is true is also a way of specifying the meaning of a sentence. Thus, instead of '*s* means that *p*', Davidson proposes, as the model for theorems of an adequate theory of meaning, '*s* is true if and only if *p*' (the use of the biconditional 'if and only if' is crucial here as it ensures the truth-functional equivalence of the sentences *s* and *p*, that is, it ensures they will have identical truth-values). The theorems of a Davidsonian theory of meaning for

German couched in English would thus take the form of sentences such as "'Schnee ist weiss' is true if and only if snow is white."

Tarski and 'Convention T'

One of the great advantages of this proposal is that it enables Davidson to connect his account of a theory of meaning with an already existing approach to the theory of truth, namely that developed by Alfred Tarski (see Tarski, 'The Concept of Truth in Formalised Languages', first published in German in 1936, reprinted in Tarski, *Logic, Semantics and Metamathematics* [1956]). Tarski's theory of truth was originally intended, not as a general account of the nature of truth, but rather as a way of defining the truth-predicate as it applies within a formal language. Tarski suggests that we arrive at a formal definition of the predicate 'is true' by providing, for every sentence *s* in the object language, a matching sentence *p* in the meta-language that is a translation of *s*. The resulting 'T-sentences' will have the form '*s* is true (in language *L*) if and only if *p*'. That an adequate theory should indeed be capable of generating a T-sentence for every sentence in the object-language is the essence of Tarski's 'Convention T' -- a requirement that clearly matches the holistic requirement Davidson also specifies for an adequate theory of meaning. And just as a Davidsonian theory of meaning treats the meaning of whole sentences as dependent on the components of those sentences, so a Tarskian theory of truth defines truth *recursively* in that it treats the truth of complex expressions as depending on the truth of more primitive expressions. In the case of those primitive expressions -- such as predicates and other terms -- to which the concept of truth does not attach, Tarski makes use of a technical notion of *satisfaction* which stands to predicates and other primitive expressions as truth stands to whole sentences: primitive expressions are understood as being satisfied or not satisfied by certain sequences of objects (just as sentences are true or false according to the obtaining or not of certain conditions). On the Tarskian account truth-conditions turn out to be definable in terms of satisfaction.

The formal structure that Tarski articulates here is identical to that which Davidson explicates as the basis for a theory of meaning: a Tarskian truth theory can generate, for every sentence of the object-language, a T-sentence that specifies the meaning of each sentence in the sense of specifying the conditions under which it is true. What Davidson's work shows, then, is that satisfaction of Tarski's Convention T can be seen as the basic requirement for an adequate theory of meaning.

A Tarskian truth theory defines truth on the basis of logical resources that are no more than those available within first-order quantificational logic. Moreover, it also defines truth 'extensionally', that is, it defines truth in terms of the objects that satisfy expressions -- in terms, we might say, of the objects that fall under those expressions -- rather than in terms of meanings, descriptions or other 'intensional' entities. Both these features represent important advantages for a Davidsonian approach (Davidson's rejection of determinate meanings as having a significant role to play in a theory of meaning already involves a commitment to an extensional approach to language). However, these features also present certain problems. Davidson wishes to apply the Tarskian model as the basis for a theory of meaning for natural languages, but such languages are far richer than the well-defined formal systems for which Tarski originally developed his approach. In particular natural languages contain features that seem to

require resources beyond those of first-order logic or of any purely extensional analysis. Examples of such features include indirect or reported speech ('Galileo said that the earth moves'), adverbial expressions ('Flora swam slowly ' where 'slowly' modifies 'Flora swam') and non-indicative sentences such as imperatives ('Eat your eggplant!'). An important part of Davidson's work in the philosophy of language has been to show how such apparently recalcitrant features of natural language can indeed be analysed so as to make them amenable to a Tarskian treatment. In 'On Saying That' (1968) and 'Quotation' (1979) he addresses the question of indirect speech; in 'Moods and Performances' (1979) he deals with non-indicative utterances; and in 'Adverbs of Action' (1985) he takes up the problem of adverbial modification. As in Davidson's analysis of actions and events, the notion of logical form plays an important part in his approach here -- the problem of how to apply a Tarskian truth theory to natural language is shown to depend on providing an analysis of the underlying logical form of natural language expressions which renders them in such a way that they fall under the scope of a purely extensional approach employing only the resources of first-order quantificational logic.

There is, however, another more general problem that affects Davidson's appropriation of Tarski. While Tarski uses the notion of sameness of meaning, through the notion of translation, as the means to provide a definition of truth -- one of the requirements of Convention T is that the sentence on the right hand side of a Tarskian T-sentence be a translation of the sentence on the left - Davidson aims to use truth to provide an account of meaning. But in that case it seems that he needs some other way to constrain the formation of T-sentences so as to ensure that they do indeed deliver correct specifications of what sentences mean. This problem is readily illustrated by the question of how we are we to rule out T-sentences of the form "'Schnee ist weiss' is true if and only if grass is green." Since the biconditional 'if and only if' ensures only that the sentence named on the left will have the same truth value as the sentence on the right, so it would seem to allow us to make any substitution of sentences on the right so long as their truth value is identical to that on the left. In one respect this problem is met by simply insisting on the way in which T-sentences must be seen as theorems generated by a theory of meaning that is adequate to the language in question as a whole (see 'Truth and Meaning'). Since the meaning of particular expressions will not be independent of the meaning of other expressions (in virtue of the commitment to compositionality the meanings of all sentences must be generated on the same finite base), so a theory that generates problematic results in respect of one expression can be expected to generate problematic results elsewhere, and, in particular, to also generate results that do not meet the requirements of Convention T. This problem can also be seen, however, as closely related to another important point of difference between a Tarskian truth theory and a Davidsonian theory of meaning: a theory of meaning for a natural language must be an empirical theory -- it is, indeed, a theory that ought to apply to actual linguistic behaviour -- and as such it ought to be empirically verifiable. Satisfaction of the requirement that a theory of meaning be adequate as an empirical theory, and so that it be adequate to the actual behaviour of speakers, will also ensure tighter constraints (if such are needed) on the formation of T-sentences. Indeed, Davidson is not only quite explicit in emphasising the empirical character of a theory of meaning, but he also offers a detailed account that both explains how such a theory might be developed and specifies the nature of the evidence on which it must be based.

Radical Interpretation

Davidson’s strategy is to embed the formal structure for a theory of meaning (the structure he finds in a Tarskian truth theory) within a more general theory of interpretation the broad outlines of which he draws from Quine (see Quine, *Word and Object* [1960]). ‘Radical translation’ is intended by Quine as an idealisation of the project of translation that will exhibit that project in its purest form. Normally the task of the translator is aided by prior linguistic knowledge -- either of the actual language to be translated or of some related language. Quine envisages a case in which translation of a language must proceed without any prior linguistic knowledge and solely on the basis of the observed behaviour of the speakers of the language in conjunction with observation of the basic perceptual stimulations that give rise to that behaviour. Davidson has a broader conception of the behavioural evidence available than does Quine (he allows that we may, for instance, identify speakers as having the attitude of ‘holding true’ with respect to sentences) and, in addition, rejects the Quinean insistence on a special role being given to simple perceptual stimulations. Moreover, since Davidson’s interest is more properly semantic than Quine’s (Quine sees radical translation as part of a primarily epistemological inquiry), while Davidson also views a theory of translation alone as insufficient to ensure understanding of the language it translates (the translation may be into a language we do not understand), so the notion of ‘translation’ is replaced in the Davidsonian account with that of ‘interpretation’. *Radical interpretation* is a matter of interpreting the linguistic behaviour of a speaker ‘from scratch’ and so without reliance on any prior knowledge either of the speaker’s beliefs or the meanings of the speaker’s utterances. It is intended to lay bare the knowledge that is required if linguistic understanding is to be possible, but it involves no claims about the possible instantiation of that knowledge in the minds of interpreters (Davidson thus makes no commitments about the underlying psychological reality of the knowledge that a theory of interpretation makes explicit).

The basic problem that radical interpretation must address is that one cannot assign meanings to a speaker’s utterances without knowing what the speaker believes, while one cannot identify beliefs without knowing what the speaker’s utterances mean. It seems that we must provide both a theory of belief and a theory of meaning at one and the same time. Davidson claims that the way to achieve this is through the application of the so-called ‘principle of charity’ (Davidson has also referred to it as the principle of ‘rational accommodation’) a version of which is also to be found in Quine. In Davidson’s work this principle, which admits of various formulations and cannot be rendered in any completely precise form, often appears in terms of the injunction to optimise agreement between ourselves and those we interpret, that is, it counsels us to interpret speakers as holding true beliefs (true by our lights at least) wherever it is plausible to do (see ‘Radical Interpretation’ [1973]). In fact the principle can be seen as combining two notions: a holistic assumption of rationality in belief (‘coherence’) and an assumption of causal relatedness between beliefs -- especially perceptual beliefs -- and the objects of belief (‘correspondence’) (see ‘Three Varieties of Knowledge [1991]). The process of interpretation turns out to depend on both aspects of the principle. Attributions of belief and assignments of meaning must be consistent with one another and with the speaker’s overall behaviour; they must also be consistent with the evidence afforded by our knowledge of the speaker’s environment, since it is the worldly causes of beliefs that must, in the ‘most basic cases’, be taken to be the objects of belief (see ‘A Coherence Theory of Truth and Knowledge’ [1983]). Inasmuch as charity is taken to generate particular attributions of belief, so those attributions are, of course, always defeasible. The principle itself is not so, however, since it remains, on the Davidsonian account, a presupposition of any interpretation whatsoever. Charity is, in this respect, both a constraint and an enabling principle in all interpretation -- it is more than just a

heuristic device to be employed in the opening stages of interpretative engagement.

If we assume that the speaker's beliefs, at least in the simplest and most basic cases, are largely in agreement with our own, and so, by our account, are largely true, then we can use our own beliefs about the world as a guide to the speaker's beliefs. And, provided that we can identify simple assertoric utterances on the part of a speaker (that is, provided we can identify the attitude of holding true), then the interconnection between belief and meaning enables us to use our *beliefs* as a guide to the *meanings* of the speaker's utterances -- we get the basis for both a rudimentary theory of belief and a rudimentary account of meaning. So, for example, when the speaker with whom we are engaged uses a certain sequence of sounds repeatedly in the presence of what we believe to be a rabbit, we can, as a preliminary hypothesis, interpret those sounds as utterances about rabbits or about some particular rabbit. Once we have arrived at a preliminary assignment of meanings for a significant body of utterances, we can test our assignments against further linguistic behaviour on the part of the speaker, modifying those assignments in accordance with the results. Using our developing theory of meaning we are then able to test the initial attributions of belief that were generated through the application of charity, and, where necessary, modify those attributions also. This enables us, in turn, to further adjust our assignments of meaning, which enables further adjustment in the attribution of beliefs, ... and so the process continues until some sort of equilibrium is reached. The development of a more finely tuned theory of belief thus allows us to better adjust our theory of meaning, while the adjustment of our theory of meaning in turn enables us to better tune our theory of belief. Through balancing attributions of belief against assignments of meaning, we are able to move towards an overall theory of behaviour for a speaker or speakers that combines both a theory of meaning and of belief within a single theory of interpretation.

Holism and Indeterminacy

Since it is indeed a single, combined theory that is the aim here, so the adequacy of any such theory must be measured in terms of the extent to which the theory does indeed provide a unified view of the totality of behavioural evidence available to us (taken in conjunction with our own beliefs about the world) rather than by reference to any single item of behaviour. This can be viewed as a more general version of the same requirement, made in relation to a formal theory of meaning, that a theory of meaning for a language address the totality of utterances for that language, although, in the context of radical interpretation, this requirement must be understood as also closely tied to the the need to attend to normative considerations of overall rationality. A direct consequence of this holistic approach is that there will always be more than one theory of interpretation that will be adequate to any particular body of evidence since theories may differ in particular attributions of belief or assignments of meaning while nevertheless providing an equally satisfactory account of the speaker's overall behaviour. It is this failure of uniqueness that Davidson terms the 'indeterminacy' of interpretation and which provides a counterpart to the 'indeterminacy of translation' that also appears, though it has a more limited application, in Quine. On the Davidsonian account, while such indeterminacy often goes unnoticed and is indeed rather less for Davidson than than for Quine (partly as a consequence of Davidson's employment of Tarski and so of the need to read the structure of first-order logic into the language interpreted), it nevertheless remains an ineliminable feature of all interpretation. Moreover, indeterminacy is not to be viewed merely as

reflecting some epistemological limitation on interpretation, but rather reflects the holistic character of meaning and of belief. Such concepts refer us to overall patterns in the behaviour of speakers rather than to discrete, entities to which interpretation must somehow gain access. Indeed, holism of this sort applies, not only to meanings and beliefs, but also to the so-called 'propositional attitudes' in general. The latter are most simply characterised as attitudes specifiable by reference to a proposition (believing that there is eggplant for dinner is a matter of holding true the proposition that there is eggplant for dinner; desiring that there be eggplant for dinner is a matter of wanting it to be true that there be eggplant for dinner) and so the *contents* of attitudes of this sort are always *propositional*. Davidsonian holism is thus a holism that applies to meanings, to attitudes, and also, thereby, to the content of attitudes. Indeed, we can speak of the Davidsonian account of interpretation as providing a quite general account of how mental content is determined (such content being understood as the content of propositional mental states such as belief): through the causal relation between speakers and objects in the world and through the rational integration of speakers' behaviour. Thus, as Davidson's approach to the theory of meaning turns out to imply a more general theory of interpretation, so his holistic view of meaning implies a holistic view of the mental, and of mental content, in general.

Davidson's commitment to the indeterminacy that follows from his holistic approach has lead some to view his position as involving a form of anti-realism about the mind and about beliefs, desires and so forth. Davidson argues, however, that the indeterminacy of interpretation should be understood analogously with the indeterminacy that attaches to measurement. Such theories assign numerical values to objects on the basis of empirically observable phenomena and in accordance with certain formal theoretical constraints. Where there exist different theories that address the same phenomena, each theory may assign different numerical values to the objects at issue (as do Celsius and Fahrenheit in the measurement of temperature), and yet there need be no difference in the empirical adequacy of those theories, since what is significant is the overall pattern of assignments rather than the value assigned in any particular case. Similarly in interpretation, it is the overall pattern that a theory finds in behaviour that is significant and that remains invariant between different, but equally adequate, theories. An account of meaning for a language is an account of just this pattern.

Although the indeterminacy thesis has sometimes been a focus for objections to Davidson's approach, it is the more basic thesis of holism as developed in its full-blown form in the account of radical interpretation (and particularly as it relates to meaning) that has often attracted the most direct and trenchant criticism. Michael Dummett has been one of the most important critics of the Davidsonian position (see especially 'What is a Theory of Meaning', in S. Guttenplan [ed.], *Mind and Language* [1975]). Dummett argues that Davidson's commitment to holism not only gives rise to problems concerning, for instance, how a language can be learnt (since it seems to require that one come to understand the whole of the language at one go, whereas learning is always piecemeal), but that it also restricts Davidson from being able to give what Dummett views as a properly full-blooded account of the nature of linguistic understanding (since it means that Davidson cannot provide an account that explicates the semantic in terms of the non-semantic). More recent criticisms have come from Jerry Fodor, amongst others, whose opposition to holism (not only in Davidson, but in Quine, Dennett and elsewhere) is largely motivated by a desire to defend the possibility of a certain scientific approach to the mind (see especially, Jerry Fodor and Ernest LePore, *Holism: A Shopper's Guide* [1992]).

Language and Convention

The heart of a Davidsonian theory of interpretation is, of course, a Tarskian truth theory. But a truth theory provides only the formal structure on which linguistic interpretation is based: such a theory needs to be embedded within a broader approach that looks to the interconnections between utterances, other behaviour and attitudes; in addition, the application of such a theory to actual linguistic behaviour must also take account of the dynamic and shifting character of such behaviour. This latter point is easily overlooked, but it leads Davidson to some important conclusions. Ordinary speech is full of ungrammatical constructions (constructions that may even be acknowledged to be ungrammatical by the speaker herself), incomplete sentences or phrases, metaphors, neologisms, jokes, puns and all manner of phenomena that cannot be met simply by the application to utterances of a pre-existing theory for the language being spoken. Linguistic understanding cannot, then, be a matter simply of the mechanical application of a Tarski-like theory (although this is just what Davidson might be taken to suggest in the early essays). In papers such as ‘A Nice Derangement of Epitaphs’ (1986), Davidson addresses just this point, arguing that while linguistic understanding does indeed depend upon a grasp of the formal structure of a language, that structure always stands in need of modification in the light of actual linguistic behaviour. Understanding a language is a matter of continually adjusting interpretative presuppositions (presuppositions that are often not explicit) in accord with the utterances to be interpreted. Furthermore, this calls upon skills and knowledge (imagination, attentiveness to the attitudes and behaviour of others, knowledge of the world) that are not specifically linguistic and that are part of a more general ability to get on in the world and in relation to others -- an ability that also resists any formal explication. In ‘A Nice Derangment of Epitaphs’, Davidson puts this point, in provocative fashion, by claiming that ‘there is no such thing as a language’ (adding the immediate qualification ‘not if a language is anything like what many philosophers and linguists have supposed’). Put less provocatively, the essential point is that linguistic conventions (and in particular linguistic conventions that take the form of agreement over the employment of shared syntactic and semantic rules), while they may well facilitate understanding, cannot be the basis for such understanding.

Davidson’s denial of rule-based conventions as having a founding role in linguistic understanding, together with his emphasis on the way in which the capacity for linguistic understanding must be seen as part as part of a more general set of capacities for getting on in the world, underlie Davidson’s much-discussed account of metaphor and related features of language (see ‘What Metaphors Mean’ [1978]). Davidson rejects the idea that metaphorical language can be explained by reference to any set of rules that govern such meaning. Instead it depends on using sentences with their ‘literal’ or standard meanings in ways that give rise to new or unexpected insights -- and just as there are no rules by which we can work out what a speaker means when she utters an ungrammatical sentence, makes a pun or otherwise uses language in a way that diverges from the norm, so there are no rules that govern the grasp of metaphor.

Knowledge and Belief

‘Three Varieties of Knowledge’

In Davidson’s work the question ‘what is meaning?’ is replaced by the question ‘What would a speaker need to know to understand the utterances of another?’ The result is an account that treats the theory of meaning as necessarily part of a much broader theory of interpretation and, indeed, of a much broader approach to the mental as such. This account is holistic inasmuch as it requires that any adequate theory must address linguistic and non-linguistic behaviour in its entirety. As we have already seen, this means that a theory of interpretation must adopt a compositional approach to the analysis of meaning; it must recognise the interconnected character of attitudes and of attitudes and behaviour; and it must also attribute attitudes and interpret behaviour in a way constrained by normative principles of rationality. Rationality is not, however, the only principle on which Davidson’s account of radical interpretation depends. It involves, in fact, a marriage of both holistic and ‘externalist’ considerations: considerations concerning the dependence of attitudinal content on the rational connections between attitudes (‘holism’) and concerning the dependence of such content on the causal connections between attitudes and objects in the world (‘externalism’). Indeed, this marriage is evident, as we saw earlier, in the principle of charity itself and its combination of considerations of both ‘coherence’ and ‘correspondence’. Davidson holds, in fact, that attitudes can be attributed, and so attitudinal content determined, only on the basis of a triangular structure that requires interaction between at least two creatures as well as interaction between each creature and a set of common objects in the world.

Identifying the content of attitudes is a matter of identifying the objects of those attitudes, and, in the most basic cases, the objects of attitudes are identical with the causes of those same attitudes (as the cause of my belief that there is a bird outside my window is the bird outside my window). Identifying beliefs involves a process analogous to that of ‘triangulation’ whereby the position of an object is determined by taking a line from each of two already known locations to the object in question -- the intersection of the lines fixes the position of the object (this idea first appears in ‘Rational Animals [1982]). Similarly, the objects of propositional attitudes are fixed by looking to find objects that are the common causes, and so the common objects, of the attitudes of two or more speakers who are capable of observing and responding to one another’s behaviour. In ‘Three Varieties of Knowledge’, Davidson develops the metaphor of triangulation into the idea of a three-way conceptual interdependence between knowledge of oneself, knowledge of others and knowledge of the world. Just as knowledge of language cannot be separated from our more general knowledge of the world, so Davidson argues that knowledge of oneself, knowledge of other persons and knowledge of a common, ‘objective’ world form an interdependent set of concepts no one of which is possible in the absence of the others.

Against Relativism and Scepticism

The inseparability of these ‘varieties’ of knowledge has a number of important implications. Since our knowledge of our own minds is not independent of our knowledge of the world nor of our knowledge of others, so we cannot treat self-knowledge as a matter of our having access to some set of private ‘mental’ objects. Our knowledge of ourselves arises only in relation to our involvement with others and with respect to a publically accessible world. Even so, we retain a certain authority over our own attitudes and utterances simply in virtue of the fact that those attitudes and utterances are indeed our own (see ‘First-Person Authority’, [1984]). Since knowledge of the world is inseparable from other forms of knowledge, so global epistemological scepticism -- the view that all or most of our beliefs about the world could be false -- turns out to be committed to much more than is usually supposed. Should it indeed turn out that our beliefs about the world were all, or for the most part, false, then this would not only imply the falsity of most of our beliefs about others, but it would also have the peculiar consequence of making false most of our beliefs about ourselves -- including the supposition that we do indeed hold those particular false beliefs. Although this may fall short of demonstrating the falsity of such scepticism, it surely demonstrates it to be deeply problematic.

The way in which the Davidsonian rejection of scepticism does indeed derive quite directly from Davidson’s adoption of a holistic, externalist approach to knowledge, and to attitudinal content in general, has sometimes been obscured by Davidson’s presentation of his argument against scepticism through the employment (for the first time in ‘Thought and Talk’) of the rather problematic notion of an ‘omniscient interpreter’. Such an interpreter would attribute beliefs to others and assign meanings to their utterances, but would nevertheless do so on the basis of his own, true, beliefs. The omniscient interpreter would therefore have to find a large amount of agreement between his own beliefs and the beliefs of those he interprets -- and what was agreed would also, by hypothesis, be true. This argument disappears from Davidson’s later discussions in which the idea of triangulation comes much more to the fore.

A feature of both the triangulation argument, and the Davidsonian account of radical interpretation, is that the attribution of attitudes must always proceed in tandem with the interpretation of utterances -- identifying content, whether of utterances or of attitudes, is indeed a single project. An inability to interpret utterances (that is, an inability to assign meanings to instances of putative linguistic behaviour) will thereby imply an inability to attribute attitudes (and vice versa). A creature that we cannot interpret as capable of meaningful speech will thus also be a creature that we cannot interpret as capable of possessing contentful attitudes. Such considerations lead Davidson to deny that non-linguistic animals are capable of thought -- where thought involves the possession of propositional attitudes such as beliefs or desires (see especially ‘Thought and Talk’ [1975]). This does not mean that such animals have no mental life at all, nor does it mean that we cannot usefully use mental concepts in explaining and predicting the behaviour of such creatures. What it does mean, however, is that the extent to which we can think of such creatures as having attitudes and a mental life like our own is measured by the extent to which we can assign determinate propositional content to the attitudes we would ascribe to those creatures. A further consequence of this view is that the idea of an untranslatable language -- an idea often found in association with the thesis of conceptual relativism -- cannot be given any coherent formulation. Inability to translate counts as evidence, not of the existence of an untranslatable language, but of the absence of a language of any sort (see ‘On the Very Idea of a Conceptual Scheme’ [1974]).

The 'Third Dogma' of Empiricism

Davidson's rejection of the idea of an untranslatable language (and the associated idea, also common to many forms of conceptual relativism, of a radically different, and so 'incommensurable' system of belief) is part of a more general argument that he advances (notably in 'On the Very Idea of a Conceptual Scheme') against the so-called 'third dogma' of empiricism. The first two dogmas are those famously identified by Quine in 'Two Dogmas of Empiricism' (in *From a Logical Point of View* [1953]). The first is that of reductionism (the idea that, for any meaningful statement, it can be recast in the language of pure sensory experience, or, at least, in terms of a set of confirmatory instances), while the second is the analytic-synthetic distinction (the idea that, with respect to all meaningful statements, one can distinguish between statements that are true in virtue of their meaning and those that are true in virtue of both their meanings and some fact or facts about the world). The rejection of both these dogmas can be seen as an important element throughout Davidson's thinking. The third dogma, which Davidson claims can still be discerned in Quine's work (and so can survive the rejection even of the analytic-synthetic distinction), consists in the idea that one can distinguish within knowledge or experience between a conceptual component (the 'conceptual scheme') and an empirical component (the 'empirical content') -- the former is often taken to derive from language and the later from experience, nature or some form of 'sensory input'. While there are difficulties in even arriving at a clear formulation of this distinction (particularly so far as the nature of the relation between the two components is concerned), such a distinction depends on being able to distinguish, at some basic level, between a 'subjective' contribution to knowledge that comes from ourselves and an 'objective' contribution that comes from the world. What the Davidsonian account of knowledge and interpretation demonstrates, however, is that no such distinction can be drawn. Attitudes are already interconnected -- causally, semantically and epistemically -- with objects and events in the world; while knowledge of self and others already presupposes knowledge of the world. The very idea of a conceptual scheme is thus rejected by Davidson along with the idea of any strong form of conceptual relativism. To possess attitudes and be capable of speech is already to be capable of interpreting others and to be open to interpretation by them.

Realism, Anti-Realism and Theories of Truth

Davidson emphasises the holistic character of the mental (both in terms of the interdependence that obtains between various forms of knowledge as well as the interconnected character of attitudes and of attitudes and behaviour). He has, at times, also referred to his position as involving a 'coherence' theory of truth and of knowledge (in 'A Coherence Theory of Truth and Knowledge' [1983]). Nevertheless, Davidson is not a coherentist, in any standard sense, about either truth or knowledge. Nor, for all that he adopts a Tarskian approach to meaning, does he espouse a correspondence theory of truth. Davidson eschews any attempt to provide an account of the nature of truth, maintaining that truth is an absolutely central concept that cannot be reduced to or replaced by any other notion (see 'The Structure and Content of Truth' [1990]). His employment of the notion of coherence is best seen as reflecting his commitment to the fundamentally rational and holistic character of the mind. It can also be seen to be tied to Davidson's rejection of those forms of epistemological foundationalism that would attempt to ground knowledge or belief in the sensory causes of belief -- beliefs, as one might expect given Davidson's

holistic approach, can find evidential support only in other beliefs. Similarly, Davidson's sometime employment of the notion of correspondence is best understood, not as providing, any direct elucidation of the nature of truth, but rather as deriving from his externalist commitment to the idea that the content of belief is dependent upon the worldly causes of belief. In 'True to the Facts' (1969) Davidson does defend what he there presents as a form of correspondence theory of truth. However, not only has Davidson since relinquished the claim that his is a 'correspondence' view of truth (see 'The Structure and Content of Truth'), but the account set out in 'True to the Facts' is, in any case, far removed from what is usually taken to be involved in any correspondence theory.

Since Davidson rejects both sceptical and relativist positions, while nevertheless insisting of the indispensability of an irreducibly basic concept of objective truth, Davidson cannot be easily situated with respect to the realist/anti-realist controversy that, until quite recently, was a major concern of many anglo-american philosophers. The Davidsonian position has, nevertheless, been variously assimilated, at different times and by different critics, to both the realist and the anti-realist camp. Yet realism and anti-realism are equally unsatisfactory from a Davidsonian point of view, since neither is compatible with the holistic and externalist character of knowledge and belief. Realism makes truth inaccessible (inasmuch as it admits the sceptical possibility that even our best-confirmed theories about the world could all be false), while anti-realism makes truth too epistemic (inasmuch as it rejects the idea of truth as objective). In this respect, and as he himself makes clear (see 'The Structure and Content of Truth'), Davidson does not merely reject the specific premises that underlie the realist and anti-realist positions, but views the very dispute between them as essentially misconceived. This reflects a characteristic feature of Davidson's thinking in general (and not just as it relates to realism and anti-realism), namely its resistance to any simple classification using the standard philosophical categories of the day.

Bibliography

[Note: The dates given in brackets after the titles of publications mentioned in the text above are the dates of first publication. For the most part articles by Davidson that appear in the collections listed below were previously published elsewhere. As a consequence, where those articles are mentioned in the text, they carry a date of publication earlier than that of the collection in which they also appear. In addition to the three volumes of collected papers listed here, a further two volumes, titled *Problems of Rationality* and *Truth*, *Lamguage and History*, are scheduled to appear in the near future]

- Davidson, Donald, *Essays on Actions and Events* (Oxford: Clarendon Press, 2nd edn, 2002), includes (amongst others): 'Actions, Reasons and Causes', 'Agency', 'Intending', 'The Logical Form of Action Sentences', 'Causal Relations', 'The Individuation of Events', 'Mental Events', 'Adverbs of Action'.
- Davidson Donald, *Inquiries into Truth and Interpretation*(Oxford: Clarendon Press, 2nd edn, 2001), includes (amongst others): 'Truth and Meaning', 'Quotation', 'True to the Facts', 'On Saying That', 'Radical Interpretation', 'Thought and Talk', 'On the Very Idea of a Conceptual Scheme'.
- Davidson, Donald, *Subjective, Intersubjective, Objective*(Oxford: Clarendon Press, 2001),

includes (amongst others): ‘First Person Authority’, ‘Rational Animnals’, ‘A Coherence Theory of Truth and Knowledge’, ‘Three Varieties of Knowledge’.

The Analysis of Knowledge

The objective of the analysis of knowledge is to state the conditions that are individually necessary and jointly sufficient for propositional knowledge: knowledge that such-and-such is the case. Propositional knowledge must be distinguished from two other kinds of knowledge that fall outside the scope of the analysis: knowing a place or a person, and knowing how to do something. The concept to be analyzed -- the analysandum -- is commonly expressed using the schema "*S* knows that *p*", where "*S*" refers to the knowing subject, and "*p*" to the proposition that is known. A proposed analysis consists of a statement of the following form: *S* knows that *p* if and only if -- . The blank is to be replaced by the analysans: a list of conditions that are individually necessary and jointly sufficient. To test whether a proposed analysis is correct, we must ask (a) whether every possible case in which the conditions listed in the analysans are met is a case in which *S* knows that *p*, and (b) whether every possible case in which *S* knows that *p* is a case in which each of these conditions is met. When we ask (a), we wish to find out whether the proposed analysans is sufficient for *S*'s knowing that *p*; when we ask (b), we wish to determine whether each of the conditions listed in the analysans is necessary.

1. Knowledge as Justified True Belief

According to the following analysis, which is usually referred to as the "JTB" account, knowledge is

justified true belief.

> **The JTB Analysis of Knowledge**:
> *S* knows that *p* iff
> (i) *p* is true;
> (ii) *S* believes that *p*;
> (iii) *S* is justified in believing that *p*.

Condition (i), the truth condition, enjoys nearly universal assent, and thus has not generated any significant degree of discussion. It is overwhelmingly clear that what is false cannot be known. For example, it is false that G. E. Moore is the author of *Sense and Sensibilia.* Since it is false, it is not the sort of thing anybody can know.

1.1 The Belief Condition

Unlike the truth condition, condition (ii), the belief condition, has generated at least some discussion. Although initially it might seems obvious that knowing that *p* requires believing that *p*, some philosophers have argued that knowledge without belief is indeed possible. Suppose Walter comes home after work to find out that his house has burned down. He utters the words "I don't believe it." Critics of the belief condition might argue that Walter knows that his house has burned down (he sees that it has), but, as his words indicate, he does not believe it. Therefore, there is knowledge without belief. To this objection, there is an effective reply. What Walter wishes to convey by saying "I don't believe it" is not that he really does not believe what he sees with his own eyes, but rather that he finds it hard to come to terms with what he sees.

A more serious counterexample has been suggested by Colin Radford.[1] Suppose Albert is quizzed on English history. One of the questions is: When did Queen Elizabeth die?" Albert doesn't think he knows, but answers the question correctly. Moreover, he gives correct answers to many other question to which he didn't think he knew the answer. Let us focus on Albert's answer to the question about Elizabeth:

> (E) Elizabeth died in 1603.

Radford makes the following two claims about this example:

(a) Albert does not believe (E). Reason: He thinks he doesn't know the answer to the question. He doesn't trust his answer because he takes it to be a mere guess.

(b) Albert knows (E). Reason: His answer is not at all just a lucky guess. The fact that he answers most of the questions correctly indicates that he has actually learned, and never forgotten, the basic facts of English history.

Since he takes (a) and (b) to be true, Radford would argue that knowledge without belief is indeed possible. How would an advocate of the JTB account respond to Radford's proposed counterexample? Their response would be, in short, that this is not a case of knowledge without belief because it isn't a case of knowledge to begin with. Albert doesn't know (E) because he has no justification for believing (E). If he were to believe (E), his belief would be unjustified. This reply anticipates what we have not yet discussed: the necessity of the justification condition. Let us first discuss why friends of JTB hold that knowledge requires justification, and then discuss in greater detail why they would not accept Radford's alleged counterexample.

1.2 The Justification Condition

Why is condition (iii) necessary? Why not say that knowledge is true belief? The standard answer is that to identify knowledge with true belief would be implausible because a belief that is true just because of luck does not qualify as knowledge. Beliefs that are lacking justification are false more often than not. However, on occasion, such beliefs happen to be true. Suppose William takes a medication that has the following side effect: it causes him to be overcome with irrational fears. One of his fears is that he has cancer. This fear is so powerful that he starts believing it. Suppose further that, by sheer coincidence, he does have cancer. So his belief is true. Clearly, though, his belief does not amount to knowledge. But why not? Most epistemologists would agree that William does not know because his belief's truth is due to luck (bad luck, in this case). Let us refer to a belief's turning out to be true because of mere luck as *epistemic luck*.It is uncontroversial that knowledge is incompatible with epistemic luck. What, though, is needed to rule out epistemic luck? Advocates of the JTB account would say that what is needed is justification. A true belief, if an instance of knowledge and thus not true because of epistemic luck, must be justified.[2] But what is it for a belief to be justified?

Among the philosophers who favor the JTB approach, we find bewildering disagreement on how this question is to be answered. According to one prominent view, typically referred to as "evidentialism", a belief is justified if, and only if, it fits the subject's evidence.[3] Evidentialists, then, would say that the reason why knowledge is not the same as true belief is that knowledge requires evidence. Opponents of evidentialism would say that evidentialist justification (i.e., having adequate evidence) is not needed to rule out epistemic luck. They would argue that what is needed instead is a suitable relation between the belief and the mental process that brought it about. What we are looking at here is an important disagreement about the nature of knowledge, which will be our main focus further below. In the meantime, we will continue our examination of the JTB analysis.

Let us return to Radford's counterexample to the belief condition, which we considered above. We are now in a position to discuss further the reply to it. Recall that Albert does not take himself to know the answer to the question about the date of Elizabeth's death. He does not because he has does not remember having learned the basic facts of British history. Now, it is of course true that he did learn these facts, and is indeed able to recall them. But is this by itself sufficient for knowing them? Philosophers who think that knowledge requires evidence would say that it is not. Albert needs to have evidence for believing that he learned those facts. Until he is quizzed, he has no such evidence. *After* the

quiz, when he is told that most of his answers were correct, he does have the requisite evidence. For once he comes to know that he is able to produce consistently correct answers to the questions he is asked, he has acquired evidence for believing that he must have learned this subject matter at school. This evidence is also evidence for the answers he has given. So at that point, the justification condition is met, and thus (since the other conditions of knowledge are also met) he knows (again) that Elizabeth died in 1603. However, he did not know this before he finds out that he must have learned those facts, for at that point his answer to the question lacked justification, and thus did not add up to knowledge. Evidentialists would deny, therefore, that Radford has supplied us with a counterexample to the belief condition.[4]

2. The Gettier Problem

In his short 1963 paper, "Is Justified True Belief Knowledge?", Edmund Gettier presented two effective counterexamples to the JTB analysis.[5] The second of these goes as follows. Suppose Smith has good evidence for the false proposition

> (1) Jones owns a Ford.[6]

Suppose further Smith infers from (1) the following three disjunctions:

> (2) Either Jones owns a Ford or Brown is in Boston.
> (3) Either Jones owns a Ford or Brown is in Barcelona.
> (4) Either Jones owns a Ford or Brown is in Brest-Litovsk.

Since (1) entails each of the propositions (2) through (4), and since Smith recognizes these entailments, he is justified in believing each of propositions (2)-(4). Now suppose that, by sheer coincidence, Brown is indeed in Barcelona. Given these assumptions, in believing (3), Smith holds a justified true belief. However, is it an instance of knowledge? Since Smith has no evidence whatever as to Brown's whereabouts, and believes what is true only because of luck, the answer would have to be ‘no’. Consequently, the three conditions of the JTB account -- truth, belief, and justification -- are not sufficient for knowledge.[7] How must the analysis of knowledge be modified to make it immune to cases like the one we just considered? This is what is commonly referred to as the "Gettier problem".

Epistemologists who think that the JTB approach is basically on the right track must choose between two different strategies for solving the Gettier problem. The first is to strengthen the justification condition. This was attempted by Roderick Chisholm.[8] The second strategy is to search for a suitable further condition, a condition that would, so to speak, "degettierize" justified true belief. Let us focus on this second strategy. According to one suggestion, the following fourth condition would do the trick:

> (iv) *S*'s belief that *p* is not inferred from any falsehood.[9]

Unfortunately, this proposal is unsuccessful. Since Gettier cases need not involve any inference, there are

possible cases of justified true belief in which the subject fails to have knowledge although condition (iv) is met. Suppose, for example, that James, who is relaxing on a bench in a park, observes a dog that, about 8 yards away from him, is chewing on a bone. So he believes

(5) There is a dog over there.

Suppose further that what he takes to be a dog is actually a robot dog so perfect that, by vision alone, it could not be distinguished from an actual dog. James does not know that such robot dogs exist. But in fact a Japanese toy manufacturer has recently developed them, and what James sees is a prototype that is used for testing the public's response. Given these assumptions, (5) is of course false. But suppose further that just a few feet away from the robot dog, there is a real dog. Sitting behind a bush, he is concealed from James's view. Given this further assumption, James's belief is true. So once again, what we have before us is a justified true belief that doesn't qualify as an instance of knowledge. Arguably, this belief is directly justified by a visual experience; it is not inferred from any falsehood. But if (5) is indeed a non-inferential belief, then the JTB account, even if supplemented with (iv), gives us the wrong result that James knows (5).

Another case illustrating that clause (iv) won't do the job is the well-known Barn County case.[10] Suppose there is a county in the Midwest with the following peculiar feature. The landscape next to the road leading through that county is peppered with barn-facades: structures that from the road look exactly like barns. Observation from any other viewpoint would immediately reveal these structures to be fakes: devices erected for the purpose of fooling unsuspecting motorists into believing in the presence of barns. Suppose Henry is driving along the road that leads through Barn County. Naturally, he will on numerous occasions form a false belief in the presence of a barn. Since Henry has no reason to suspect that he is the victim of organized deception, these beliefs are justified. Now suppose further that, on one of those occasions when he believes there is a barn over there, he happens to be looking at the one and only real barn in the county. This time, his belief is justified and true. But its truth is the result of luck, and thus his belief is not an instance of knowledge. Yet condition (iv) is met in this case. His belief is clearly not the result of any inference from a falsehood. Once again, we see that (iv) does not succeed as a solution to the Gettier problem.

Above, we noted that the role of the justification condition is to ensure that the analysans does not mistakenly identify as knowledge a belief that is true because of epistemic luck. The lesson to be learned from the Gettier problem is that the justification condition by itself cannot ensure this. Even a justified belief, understood as a belief based on good evidence, can be true because of luck. Thus if a JTB analysis of knowledge is to rule out the full range of cases of epistemic luck, it must be amended with a suitable fourth condition, a condition that succeeds in preventing justified true belief from being "gettiered." We will refer to an analysis of this type as a "JTB+" conception of knowledge.

3. An Alternative Approach: Reliabilism

The analysis of knowledge may be approached by asking the following question: What turns a true belief

into knowledge? An uncontroversial answer to this question would be: the sort of thing that effectively prevents a belief from being true as a result of epistemic luck. Controversy begins as soon as this formula is turned into a substantive proposal. According to evidentialism, which endorses the JTB+ conception of knowledge, the combination of two things accomplishes this goal: evidentialist justification plus degettierization (a condition that prevents a true and justified belief from being "gettiered"). However, according to an alternative approach that has in the last three decades become increasingly popular, what stands in the way of epistemic luck -- what turns a true belief into knowledge -- is the reliability of the cognitive process that produced the belief. Consider how we acquire knowledge of our physical environment: we do so through sense experience. Sense experiential processes are, at least under normal conditions, highly reliable. There is nothing accidental about the truth of the beliefs these processes produce. Thus beliefs produced by sense experience, if true, should qualify as instances of knowledge. An analogous point could be made for other reliable cognitive processes, such as introspection, memory, and rational intuition. We might, therefore, say that what turns true belief into knowledge is the reliability of our cognitive processes.

This approach -- reliabilism, as it is usually called -- can be carried out in two different ways. First, there is reliabilism as a theory of justification (J- reliabilism).[11] Here the idea is that while justification is indeed necessary for knowledge, its nature is not evidentialist but reliabilist. The most basic version of this view -- let's call it "simple" J-reliabilism -- goes as follows:

> **Simple J-Reliabilism**:
> *S* is justified in believing that *p* if, and only if, *S*'s belief that *p* was produced by a reliable cognitive process.

Second, there is reliabilism as a theory of knowledge (K-reliabilism).[12] According to this approach, knowledge does not require justification. Rather, what it requires (in addition to truth) is reliable belief formation. Fred Dretske defends this view as follows:

> Those who think knowledge requires something *other than*, or at least *more than*, reliably produced true belief, something (usually) in the way of justification for the belief that one's reliably produced beliefs *are* being reliably produced, have, it seems to me, an obligation to say what benefits this justification is supposed to confer . . . Who needs it, and why? If an animal inherits a perfectly reliable belief-generating mechanism, and it also inherits a disposition, everything being equal, to *act* on the basis of the belief so generated, what additional benefits are conferred by a justification that the beliefs *are* being produced in some reliable way? If there are no additional benefits, what good is this justification? Why should we insist that no one can have knowledge without it?[13]

Further below we will discuss how advocates of the JTB approach might answer Dretske's question. In the meantime, let us focus a bit more on Dretske's account of knowledge. According to Dretske, reliable cognitive processes convey information, and thus endow not only humans, but (nonhuman) animals as well, with knowledge. He writes:

> I wanted a characterization that would at least allow for the possibility that animals (a frog, rat, ape, or my dog) could know things without my having to suppose them capable of the more sophisticated intellectual operations involved in traditional analyses of knowledge.[14]

Attributing knowledge to animals is certainly in accord with our ordinary practiceof using the word ‘knowledge’. Dretske seems right, therefore, when he views the result that animals have knowledge as a desideratum.

A second advantage of his theory is, so Dretske claims, that it avoids Gettier problems. He says:

> Gettier difficulties . . . arise for any account of knowledge that makes knowledge a product of some justificatory relationship (having good evidence, excellent reasons, etc.) that *could* relate one to something false . . . This is [a] problem for justificational accounts. The problem is evaded in the information-theoretic model, because one can get into an appropriate justificational relationship to something false, but one cannot get into an appropriate informational relationship to something false.[15]

Solving the Gettier-problem is, however, a bit more complex than this passage suggests. Consider again the case of Henry in Barn County. He sees a real barn in front of him, yet does not know that there is a barn near-by. Exactly how can Dretske's theory explain Henry's failure to know? After all, he perceives an actual barn, and so does not stand in any informational relationship to something false. So if perception, on account of its reliability, normally conveys information, it should do so in this case as well. Alas, it doesn't. Clearly, if a theory like Dretske's is to handle this case and others like it, it must be supplemented with a clause that makes it immune to the case of the fake barns, and other examples like it.[16]

4. Internalism and Externalism

Evidentialists reject both J-reliabilism and K-reliabilism. They reject J-reliabilism because they advocate internalism: they take justification to be something that is "internal" to the subject. J-reliabilists disagree; they take justification to be something that is "external" to the subject.[17]

In order to pin down what the "internality" of justification is supposed to be, let us turn to Roderick Chisholm, one of the chief advocates of internalism. In the third edition of *The Theory of Knowledge*, Chisholm says the following:

> If a person *S* is internally justified in believing a certain thing, then this may be something he can know just by reflecting upon his own state of mind.[18]

In the second edition of this book, he characterizes internalism in a somewhat different way:

> We presuppose . . . that the things we know are justified for us in the following sense: we can know what it is, on any occasion, that constitutes our grounds, or reasons, or evidence for thinking that we know.[19]

These passages differ in the following respect: in the first Chisholm is concerned with the property of justification (a belief's being justified); in the second, with justifiers: the things that make justified beliefs justified. What is common to both passages is the constraint Chisholm imposes. In the first passage, Chisholm characterizes justification as something that is recognizable *on reflection*, and in the second as the sort of thing that can be known *on any occasion.*Arguably, this is just a terminological difference. It would not be implausible to claim that what can be recognized through reflection is something that can be recognized on any occasion, and what can be recognized on any occasion is something that can be recognized through reflection. Although this point deserves further examination, let us here simply assume that recognizability on reflection and recognizability on any occasion amount to the same thing. In what follows, we will refer to it as *direct recognizability*.

As already noted, in the first passage Chisholm imposes the direct recognizability constraint on justification, in the second on justifiers. Does this amount to a substantive difference? If the direct recognizability of justifiers implies the direct recognizability of justification, and vice versa, then the two passages we considered would indeed just be alternative ways of stating the same point. Whether they really are is debatable, but here we will simply assume that it makes no difference whether internalism is characterized in terms of the direct recognizability of justification, or that of justifiers.

Chisholm, then, defines internalism in terms of how justification (justifiers) is (are) knowable, that is, in terms of direct recognizability, or epistemic accessibility. This type of internalism may therefore be called *accessibility internalism*. Alternatively, internalism can be defined in terms of limiting justifiers to mental states. According to this second way of defining internalism, justifiers must be internal to the mind, i.e., must be mental events or states. Internalism thus defined could be referred to as *mental state internalism*.[20] Whether accessibility internalism and mental state internalism are genuine alternatives depends on whether mental states (and events) are directly recognizable. If they are, what appear to be genuine alternatives might in fact not be.[21] Since here we cannot go into the details of this issue, we will cut this matter short and simply define internalism, as suggested by Chisholm, in terms of direct recognizability, while acknowledging that it might be preferable to define it by restricting justifies to mental states. We will refer to internalism as defined here as "J-internalism," since it imposes the direct recognizability constraint on not knowledge, but justification.

> **J-Internalism**:
> Justification is directly recognizable. At any time *t* at which *S* holds a justified belief *B*, *S* is in a position to know at *t* that *B* is justified.[22]

J-internalism is to be contrasted with J-externalism, which is simply its negation.

> **J-Externalism**:
> Justification is not directly recognizable. It is not the case that at any time *t* at which *S* holds a justified belief B, *S* is in a position to know at *t* that *B* is justified. (There are times at which *S* holds a justified belief *B* but is not in a position to know that *B* is justified.)

Next, we will discuss what consequences we can derive from J-internalism. To begin with, we can derive the result that simple J-reliabilism is an externalist theory. According to Simple J-Reliabilism, reliability by itself -- without the subject's having any evidence indicating its presence -- is sufficient for justification. So simple J-reliabilism allows for possible cases of the following kind:

- (i) the subject holds a reliably formed belief;
- (ii) the subject has no evidence whatever indicating that this belief was reliably formed, nor any other evidence in its support;
- (iii) the belief in question is justified.

To illustrate this point, let us consider a familiar example due to Laurence BonJour. Suppose Norman is a perfectly reliable clairvoyant. At time t, his clairvoyance causes Norman to form the belief that the president is presently in New York. However, Norman has no evidence whatever indicating that he is clairvoyant. Nor has he at *t* any way of recognizing that his belief was caused by his clairvoyance. Norman, then, cannot at *t* recognize that his belief is justified. So Simple J-reliabilism implies that Norman's belief is justified at *t* although Norman cannot recognize at *t* that that his belief is justified. Simple J-Reliabilism, therefore, is a version of J-externalism.

Second, J-internalism allows us to derive the consequence -- as it should -- that evidentialism is an internalist theory. The question of what a person's evidence consists of is of course not uncontroversial.[23] Nor is it uncontroversial what kind of cognitive access a subject has to her evidence.[24] However, it would certainly not be without a good deal of initial plausibility, at least if one looks at the matter from the point of view of the evidentialist, to make the following two assumptions. First, a subject's evidence consists of both her beliefs and experiential states (such as sensory, introspective, memorial, and intuitional states). Second, a subject's beliefs and experiential states are directly recognizable to her. And if we now add the further assumption (mentioned above) that the direct recognizability of justifiers implies the direct recognizability of justification, then we get the result that evidentialism is a form of J-internalism. Let us display the argument in detail:

> **Why Evidentialism Is A Version of J-Internalism**:
> (1) According to evidentialism, justifiers consist of a person's evidence.
> (2) A person's evidence is directly recognizable to that person.
> Therefore:
> (3) According to evidentialism, a person's justifiers are directly recognizable to that person.

(4) If the justifiers that make a person's justified beliefs justified are directly recognizable to that person, then the justification of that person's justified beliefs is directly recognizable to that person.

Therefore:

(5) According to evidentialism, the justification of a person's justified beliefs is directly recognizable to that person.

The crucial premises in this argument are (2) and (4). Surely, evidentialists would be reluctant to call "evidence" something that is not directly recognizable to a subject.[25] So (2) would appear to be a premise that evidentialists are likely to endorse. And (4) expresses no more than one part of what we already assumed: that the direct recognizability of justifiers implies the direct recognizability of justification, and vice versa. Of course, this assumption might be challenged. What seems safe to say, therefore, is the conditional point that, if (2) and (4) capture what is essential to evidentialism, then evidentialism implies internalism about justification.

As mentioned at the beginning of this section, evidentialists also reject K-reliabilism. They do so because, pace Dretske, they think that internal justification -- justification in the form of having adequate evidence -- is necessary for knowledge. In other words, they deny that a belief's origin in a reliable cognitive process is sufficient for the belief's being an instance ofknowledge. Let us refer to this position as internalism about knowledge, or K-internalism, and let us define it using the concept of *internal justification*: the kind of justification that meets the direct recognizability constraint.

> **K-Internalism**:
> Internal justification is a necessary condition of knowledge. A belief's origin in a reliable cognitive process is *not* sufficient for its being an instance of knowledge.

K-externalism is simply the negation of internalism:

> **K-Externalism**:
> Internal justification is not a necessary condition of knowledge. A belief's origin in a reliable cognitive process *is* sufficient for its being an instance of knowledge. Consequently, there are cases of knowledge without internal justification.

In this section, we have merely concerned ourselves with what internalists and externalists disagree about with regard to both justification and knowledge. In the next two sections, we will examine what reasons internalists and externalists can cite in support of their respective views.

5. Why Internalism?

To begin with, one straightforward argument for J-internalism proceeds from evidentialism as a premise. For as we have seen above, there is a plausible construal of evidentialism that proceeds from the direct

recognizability of a person's evidence to the direct recognizability of justification. So philosophers who are attracted to evidentialism are likely to be attracted to J-internalism as well. Furthermore, as was already mentioned at the end of the previous section, evidentialism is not only a view about the nature of justification, but also a view about the nature of knowledge. And what evidentialists would say about the nature of knowledge is this: having justification -- in the form of having adequate evidence -- is a necessary condition of knowledge.[26] But such justification is plausibly construed as internal justification, as satisfying the direct recognizability constraint that J-internalism imposes. It would appear, therefore, that evidentialists take internal justification to be necessary for knowledge, and thus hold the view we have labeled "K-internalism".

Second, there is an argument for internalism that starts with what is referred to as the deontological conception of epistemic justification:

> **Deontological Justification**:
> *S* is justified in believing that *p* iff in believing that *p*, *S* does not violate his epistemic duty.

The concept of duty employed here must not be confused with ethical duty, or prudential duty. The type of duty in question is specifically epistemic.[27] Exactly what epistemic duties are, however, is a matter of controversy. The basic idea is that epistemic duties are those that arise in the pursuit of truth.[28] Thus we might express (1) alternatively as follows: *S* is justified in believing that *p* iff in believing that *p*, *S* does not fail to do what he ought to do in the pursuit of truth. Of course, this way of putting things leads us directly to a further question: in the pursuit of truth, exactly what is it that one ought to do? Evidentialists would say: it is to believe what, and only what, one has evidence for.[29] Now if that is one's epistemic duty, then those who take justification to be deontological can employ the argument considered above (which proceeds from evidentialism to J-internalism) to derive the conclusion that deontological justification is internal justification. So the combination of deontology about justification with evidentialism allows for a pretty straightforward derivation of J-internalism.

It has also been suggested that there is a more direct argument from deontology to J-internalism, an argument that does not depend on evidentialism as a premise.[30] It derives the direct recognizability of justification from the premise that what determines epistemic duty is directly recognizable.

> **From Deontology to Internalism**:
> (1) Justification is a matter of epistemic duty fulfillment.
> Therefore:
> (2) What determines justification is identical to what determines epistemic duty.
> (3) What determines epistemic duty is directly recognizable.
> Therefore:
> (4) What determines justification is directly recognizable.

(5) If what determines justification is directly recognizable, then justification itself is directly recognizable.

Therefore:

(6) Justification is directly recognizable.

(2) follows directly from the deontological conception of justification. (5) is nothing new; we have assumed it above already. The argument's main premise is of course (3).[31] Certainly (3) is not obviously implausible. Nevertheless, it is open to criticism, as is (5), which we merely assumed. Obviously, then, the argument is not uncontroversial. Nevertheless, it seems fair to say that it represents a straightforward and defensible derivation of internalism from deontology.

Third, internalism (J or K) can be defended indirectly on the basis of objections to particular externalist accounts of justification or knowledge. Since reliabilism is the dominant externalist approach, let us briefly consider a couple of internalist objections to reliabilism. First, recall BonJour's example of Norman: a subject who unwittingly possesses a reliable faculty of clairvoyance.[32] This faculty produces the belief that the president is in New York, a belief that is reliably produced, and thus according to simple J-reliabilism justified. But is that belief really justified? Internalists would say that Norman's belief is actually unjustified, and thus not an instance of knowledge. They would say, therefore, that a belief's being reliably produced is not sufficient for making it justified, and that a true belief's being reliably produced is not sufficient for making it an instance of knowledge.

Second, internalists would say that reliable belief production is not even necessary for knowledge. Suppose you are a victim of Descartes's evil demon. You believe that you have a body and that there is a world of physical things, but in fact neither of these beliefs is true. There is no physical world at all. Since your perceptual beliefs are not reliably produced under these circumstances, simple J-reliabilism implies that they are unjustified. To internalists, this is an intuitively implausible result. They would take your beliefs to be (by and large) justified because they are (by and large) based on adequate evidence or good reasons.[33] Hence they would reject the claim that being produced by reliable faculties is a necessary condition of epistemic justification.[34]

6. Why Externalism?

One reason for externalism lies in the attraction of "philosophical naturalism." According to Gilbert Harman, this view, when applied to ethics, "is the doctrine that moral facts are facts of nature. Naturalism as a general view is the sensible thesis that *all* facts are facts of nature."[35] What naturalists in ethics want, according to Harman,

> is to be able to locate value, justice, right, wrong, and so forth in the world in the way that tables, colors, genes, temperatures, and so on can be located in the world.[36]

According to this conception of naturalism, a naturalist in epistemology wants to be able to locate such things as knowledge, certainty, epistemic justification, and probability "in the world in the way that tables, colors, genes, temperatures, and so on can be located in the world." How, though, are naturalists to accomplish this? According to one answer to this question, they can accomplish this by identifying the non-epistemic grounds on which epistemic phenomena supervene. Alvin Goldman describes this desideratum as follows:

> The term "justified," I presume, is an evaluative term, a term of appraisal. Any correct definition or synonym of it would also feature evaluative terms. I assume that such definitions or synonyms might be given, but I am not interested in them. I want a set of *substantive* conditions that specify when a belief is justified . . . I want a theory of justified belief to specify in non-epistemic terms when a belief is justified."[37]

However, internalists need not deny that epistemic phenomena supervene on non-epistemic grounds, and that it is the task of epistemology to reveal these grounds. That is, internalists might as well agree that what a theory of justification ought to accomplish is an account of the substantive conditions of justification that is carried out in non-epistemic terms. It is doubtful, therefore, that the goal of locating epistemic value in the natural world establishes a link between philosophical naturalism and externalism.[38]

According to a second answer to the question of how epistemic value can be located in the natural world, the way to do that is to employ the methods of the natural sciences.[39] Appealing to this methodological constraint, externalists might argue that, because the study of justification and knowledge is an empirical study, justification and knowledge cannot be what internalists take it to be, but rather must be identified with reliable belief production: a phenomenon that can be studied empirically. It is far from clear, however, that the fundamental questions of epistemology can be answered by employing the methods of natural science. If they cannot be answered that way, then epistemology cannot be done without employing, at least to some extent, the a priori methods of the armchair philosopher. But then the universal scope of the methodological constraint in question remains unmotivated, and no compelling reason remains to think that justification and knowledge are the sort of thing that can only be studied empirically, and thus cannot be what internalist take them to be.

A second reason for externalism (more specifically, J-externalism) has to do with the connection between justification and truth. Internalists conceive of a justified belief as a belief that, relative to the subject's evidence or reasons, is likely to be true. However, such likelihood of truth is compatible with the belief's actual falsity. Indeed, such likelihood of truth is compatible with the evil demon scenario in which the vast majority of your empirical beliefs, although justified, is in fact false. Externalists consider this connection between justification and truth too thin, and thus demand a stronger kind of likelihood of truth.[40] Reliability is usually taken to fill the bill.[41] William Alston, for example, would concur that, without a reliability constraint, the connection between justification and truth becomes too tenuous.[42] He argues that only reliably formed beliefs can be justified, and defines a reliable belief-producing mechanism as one that "would yield mostly true beliefs in a sufficiently large and varied run of

employments in situations of the sorts we typically encounter."[43] Suppose we endorse this conception of justification. Let's suppose further that most of our beliefs are justified. It then follows that most of the beliefs we form in ordinary circumstances would have to be true most of the time. Such a belief system could still be brought about by an evil demon. However, it would not be a belief-system consisting of mostly false beliefs, and thus the evil demon responsible for it wouldn't be quite as evil as he could be. So what Alston-type justification rules out is this: a belief system of mostly justified beliefs that is generated by an evil demon who sees to it that most of our beliefs are false. This, then, is the benefit we can secure when, as externalists suggest, we make reliability a necessary element of justification.

Internalists would object that a strong link between justification and truth runs afoul of the rather forceful intuition that the beliefs of an evil demon victim are justified although they are mostly false. In response, externalists might concede that the sort of justification internalists have in mind and attribute to evil demon victims is a legitimate concept, but question the epistemological relevance of that concept. Of what *epistemic* value (of what value to the acquisition of knowledge), they might ask, is internal justification if it is the sort of thing an evil demon victim can enjoy, a person whose belief system is massively marred by falsehood? Internalists would reply that internal justification should not be expected to supply us with a guarantee of truth, and that its value derives from the fact that internal justification is necessary for knowledge.

A third reason for externalism has to do with Dretske's question about justification: "Who needs it, and why?" Dretske would say, of course, that nobody needs it (for the acquisition of knowledge, that is) because reliable belief production is sufficient for turning true belief into knowledge. With this, internalists disagree.[44] They take the existence of examples like BonJour's clairvoyant Norman as a decisive reason to reject this sufficiency claim. According to them, Norman's belief about the whereabouts of the president, although reliably formed, is clearly unjustified, and thus not an instance of knowledge. Internalists, therefore, would answer Dretske's question thus: Those who wish to enjoy knowledge need justification, and they need it because one does not know that *p* unless one has adequate evidence or undefeated reasons for believing that *p*.

In reply to this, Dretske might repeat a point -- a point that amounts to a fourth reason for externalism -- from the passage we considered above: he takes animals such as frogs, rats, apes, and dogs to have knowledge. This is surely in line with the way we ordinarily use the concept of knowledge. The owner of a pet who does not attribute knowledge to it would be hard to find. But are animals capable of the sophisticated mental operations required by beings who enjoy the sort of justification internalists have in mind? It would seem not.[45] At this point, the disagreement between internalists and externalists appears unresolvable. On the one hand, there are examples like BonJour's clairvoyant Norman, examples that strongly suggest that internal justification *is* necessary for knowledge. On the other hand, there is Dretske's point that knowledge is enjoyed by not only humans but animals as well. And this strongly suggests that internal justification is *not* necessary for knowledge.

7. Two Analyses of Knowledge

K-internalism and K-externalism, then, are supported by conflicting intuitions. On the one hand, there is the thought that in order to know, one must have justification in the form of having adequate evidence or reasons. On the other hand, there is the thought that knowledge, resulting from reliable cognitive faculties, is not reserved to humans only. Both of these thoughts are inherently plausible. However, if it is indeed true that animals are not the sort of beings that can have internally justified or unjustified beliefs, these intuitions cannot be reconciled. If they cannot, then we get as a result of this irreconcilability two alternative and competing analyses of knowledge: one internalist, the other externalist. Let us state a gloss of the respective analyses. In these analyses, the term "internal justification" stands for the kind of concept internalists have in mind, and the term "external justification" for the kind of concept externalists employ.

> **External Knowledge (EK)**:
> *S* knows that *p* iff
>
> (i) *p* is true;
>
> (ii) *S* believes that *p*;
>
> (iii) *S* is externally justified in believing that *p*.

> **Internal Knowledge (IK)**:
> *S* knows that *p* iff
>
> (i) *p* is true;
>
> (ii) *S* believes that *p*;
>
> (iii) *S* is internally justified in believing that *p*;
>
> (iv) *S*'s belief that *p* is degettiered.

EK and IK agree and differ in the following respects:

(a) According to both EK and IK, knowledge requires true belief. The question each of these analyses is intended to answer is: what do we need to add to true belief to get knowledge?

(b) According to both, external justification is necessary for knowledge. K-internalists acknowledge the necessity of external justification at least indirectly when they make degettierization a necessary condition of knowledge. The explanation of this point has to do with the nature of degettierization. What sort of thing would achieve it? Let us venture a hypothesis: what achieves degettierization is the sort of thing that produces external justification. If that is correct, then it follows that K-internalists are in agreement with K-externalists about the necessity of external justification.

(c) IK requires internal justification, EK does not. That is the one condition where the two analyses differ. As a result of this difference, EK includes within the scope of knowledge animals, but fails to accommodate the intuition underlying BonJour's case of clairvoyant Norman, and other cases like that. IK, on the other hand, does accommodate this intuition, but -- counter-intuitively, as K-externalists would say -- excludes animals from the range of subjects that can have knowledge.

If the internalism/externalism controversy is seen as essentially a controversy over the nature of knowledge, the debate over J-internalism vs. J-externalism would appear to be a case of talking past each other. J-internalists and J-externalists simply intend justification to achieve different things. They each operate with a different concept of justification. J-externalists take justification to be the sort of thing that turns true belief into knowledge, and view the Gettier problem merely as the problem of adding the right sort of bells and whistles to the justification-condition. J-internalists, on the other hand, cannot view degettierization as something that can, in the form of a suitable clause, be tacked on to the justification condition, for degettierization is an external matter.[46] Rather, internalists take justification to be the sort of thing that turns true *and* degettiered belief into knowledge. Since J-internalists and J-externalists assign different roles to justification, what they ultimately disagree about is not the nature of justification, but the sort of thing in relation to which the theoretical role of epistemic justification is fixed: knowledge. Internalists assign justification the role of turning true and degettiered belief into knowledge because they take internal justification to be necessary for knowledge. In contrast, externalists assign a different role -- that of turning true belief into knowledge -- to justification because they think that internal justification is *not* necessary for knowledge. It is this difference in their respective views on the nature of knowledge that leads to different views on the nature of justification.

Thus we are confronted with a fundamental disagreement about the nature of knowledge. Externalists such as Dretske would say that the desideratum of making knowledge a natural phenomenon that is instantiated equally by humans and animals must trump the demand that knowledge require the possession of justification in the form of adequate evidence. They would have to say, therefore, that Norman, the unwitting clairvoyant, has knowledge just as much as a mouse that knows where to look for the cheese. Internalists would argue the other way around. To them, Norman-type cases establish the necessity of adequate evidence or undefeated reasons. And so they would say that, just as Norman's reliable clairvoyance (by itself, in the absence of evidence) does not give him knowledge, a mouse's reliable cognitive mechanisms do not give it knowledge of where to look for the cheese. Externalists would say that it merely seems to us that Norman lacks knowledge when in fact he has it. Internalists would say that it merely seems to us that animals know when in fact they do not.

Who is right about the nature of knowledge: internalists or externalist? It might be a mistake to expect that there is a decisive argument that settles the dispute one way or the other.[47] Most likely, one reason why the nature of knowledge is a subject matter of philosophy is that in the end its nature remains enigmatic. Nevertheless, the common ground shared by IK and EK should not be overlooked. Both require true belief and external justification. What is contentious is merely the further question of whether knowledge requires internal justification as well.[48]

Notes to The Analysis of Knowledge

Notes

1. See Radford 1966.

2. It is important not to misunderstand the justification condition. What it requires for knowledge is not that the subject have engaged in the *activity* of justifying the belief, or performed the act of showing (or trying to show) that the belief is justified. Rather, what the justification condition requires is merely that the belief that qualifies as knowledge have the *property* of being justified. It can have that property even if the subject has not in fact shown to anyone that the belief is justified. Consider an ordinary person's belief that five and five is ten. Most people have never attempted to justify this belief, and probably would be at a loss as to how to go about justifying it. But for most people, that belief would qualify as an instance of knowledge. The importance of the distinction between the activity of justifying and a belief's property of being justified is emphasized by William Alston in the following passage: "To turn to justification, the first point is that I will be working with the concept of a subject S's *being justified in believing that p*, rather than with the concept of S's *justifying* a belief. That is, I will be concerned with the state or conditionof being justified, rather than with the *activity* of justifying a belief. It is amazing how often these concepts are conflated in the literature. The crucial difference between them is that while to justify a belief is to marshal considerations in its support, in order for me to be justified in believing that *p* it is not necessary that I have done anything by way of an argument for *p* or for my epistemic situation vis-à-vis *p*. Unless I am justified in many beliefs without arguing for them, there is precious little I justifiably believe." Alston 1991, p. 71. For an alternative view, see Almeder 1999, pp. 90 and 123. Almeder defends the view that, "as a matter of ordinary discourse, 'being justified' is not something we can always separate from the activity of giving, or being able to give, reasons when the question 'How do you know?' is appropriately asked." Ibid, p. 92.

3. For a defense of evidentialism, see Feldman and Conee 1985. For criticisms of evidentialism, see De Rose 2000, and Plantinga 1996, pp. 358-361.

4. For a good discussion of objections to the belief condition, see Lehrer 1990, chapter 2.

5. Gettier 1963.

6. Gettier states explicitly the assumption that a justified belief can be false.

7. There are, therefore, two reasons why knowledge is not to be analyzed as true belief. First, a true belief

might fail to be justified. Second, a true belief might be justified but fail to be knowledge because the subject is in a Gettier-type situation.

8. See Chisholm 1977, chapter 6. Chisholm's strategy of building a degettierization clause into the justification condition is difficult to understand, given Chisholm's deep commitment to internalism. Since degettierization is an external matter, this strategy makes justification an external property. (See note 46) Thus, for internalists the place to take care of the Gettier problem is clearly a fourth condition.

9. See, for example, Armstrong 1973, p. 152, and Clark 1963. For further references, see Shope 1983, p. 24. This monograph provides a comprehensive discussion of the Gettier literature up to 1980. For a shorter but excellent discussion of the Gettier problem, see the Appendix in Pollock 1986.

10. See Goldman 1976.

For an example of a reliability condition amended so as to solve the Gettier problem, see Goldman 1976. See also Goldman 1986, pp. 46-7.

11. For examples of J-reliabilism, see: Goldman 1979, 1986, and Swain 1981.

12. For examples of K-reliabilism, see: Armstrong 1973, Dretske 1981, and Nozick 1981.

13. Dretske, 1989, p. 95.

14. Dretske 1985, p. 177.

15. Ibid, p. 179.

16. We might, therefore, distinguish between reliabilism, and reliabilism+, where the latter, unlike the former, involves a suitable degettierization clause. For an example of a reliability condition amended so as to solve the Gettier problem, see Goldman 1976. See also Goldman 1986, pp. 46-7. It should be noted, however, that the "+" in reliabilism+ need not take the form of a fourth condition. Rather, the "+" can simply be a suitable clause within the justification condition, where that condition is, of course, formulated in terms of reliability. (For an example of a reliability condition amended so as to solve the Gettier problem, see Goldman 1976. See also Goldman 1986, pp. 46-7.) But within an *internalist* JTB+ account of knowledge (to be discussed in the next section), the"+" demands a separate and fourth condition, since internal justification and degettierization differ in a crucial respect: unlike the former, the latter is an external affair. See note 46. Consequently, if we think of the "+" in JTB+ as a separate condition that cannot be mixed in with the justification condition, then the need to account for Gettier cases does not require of us to move from reliabilism to reliabilism+ in the same way as it requires of us to move from JTB to JTB+.

17. For literature discussing the internalism/externalism debate, see Alston 1989, pp. 185-226, BonJour 1985, chapter 3, Conee and Feldman, forthcoming, Goldman 1999, Fumerton 1995, Sosa 1999, Steup 1998, and Steup, 2001b.

18. Chisholm 1989, p. 7.

19. Chisholm 1977, p. 17.

20. Conee and Feldman (forthcoming) argue that internalism should be characterized in terms of mental states and events.

21. On the other hand, if mental states/events are not directly recognizable, the mental state criterion might not give internalists what they want. The problem here is that internalists would not want to count, for example, the state of being reliably clairvoyant as a mental state. If they did, they would not be in a position to deny that (unwittingly)reliable clairvoyance is a source of justification. Thus the need arises to differentiate between neurophysiological states that are, and those that are not, mental states. It might be that the best way to achieve this is to say that only directly recognizable neurophysiological states are mental states. But if the direct recognizability criterion is needed to define mental states, then mental state internalism does not appreciably differ from accessibility internalism.

22. If *S* is knocked out, or perhaps only sleeping, is he in a position to know the justificational status of any of her beliefs? Those who would say ‘no’ should reformulate the definition of J-internalism as follows: At any time *t* at which *S* is capable of thinking and holds a justified belief *B*, *S* is in a position to know at *t* that *B* is justified.

23. For a brief article on the concept of evidence, see Feldman 1992. See also Feldman 1988b.

24. For discussion of this issue, see Goldman 1999, and Steup 2001b.

25. The reason for this is that the kind of evidence that is relevant to a belief's justificational status must be evidence the subject possesses. But what brings evidence into the subject's possession? According to a strict view, only if it comes in the form of propositions that the subject believes. The problem with this view is its narrow scope. It excludes sensory experiences and memories from the kind of evidence that a subject possesses. Arguably, the best way to include them is to say this: evidence the subject possesses consists of the sorts of things that she can recognize on reflection, that is, that are directly recognizable to her.

26. It could be objected that an evidentialist would not have to be a K-internalist. The two theories are logically independent. Perhaps they are. It seems to me, however, that an evidentialist who doesn't take the possession of evidence to be a necessary condition of knowledge would be a strange bird indeed.

27. This view was held, for example, by Chisholm. In the second edition of his *Theory of Knowledge*, he wrote:

> We may assume that every person is subject to a purely intellectual requirement---that of trying his best to bring it about that, for every proposition *h* that he considers, he accepts *h* if and only if *h* is true. (1977, p. 14)

Laurence BonJour is another epistemologist who endorses a deontological conception of epistemic justification. He expresses it thus:

> The distinguishing characteristic of epistemic justification is thus its essential or internal relation to the cognitive goal of truth. It follows that one's cognitive endeavors are epistemically justified only if and to the extent that they are aimed at this goal, which means very roughly that one accepts all and only those beliefs which one has good reason to think are true. To accept a belief in the absence of such a reason, however appealing or even mandatory such acceptance might be from some other standpoint, is to neglect the pursuit of truth; such acceptance is, one might say, epistemically irresponsible. My contention here is that the idea of avoiding such irresponsibility, of being epistemically responsible in one's believings, is the core of the notion of epistemic justification. (1985, p. 8)

For further literature on the deontological conception of justification, see Alston 1989, pp. 81-152, Feldman 1988, and Steup 1996, chapter four.

28. For literature on the role of truth in epistemology, see Alston 1996, chapter 8, David 2001, and De Paul 2001.

29. Alternatively, evidentialists could drop the first part of this conjunction. Is it really my epistemic duty to believe *everything* that my evidence supports? It could be objected that it is hard to understand why it should be my epistemic duty to clutter up my belief system with trivial logical consequences of what my evidence supports. The reply to that would be that the consideration of clutter is not an epistemic, but a practical consideration. For discussion of this issue, see Feldman 1988.

30. For example, Goldman (1999) takes the rationale for internalism to rest on the deontological conception of justification as its main premise. For discussion of this issue, see Feldman forthcoming, and Steup 2001b.

31. The argument for (3) would go as follows: The concept of a duty has built into it an epistemic aspect. That by virtue of which a subject has a duty must, in the very least, be readily knowable, if not directly recognizable, to the subject. For otherwise, the could be such a thing as an unrecognizable duty, which is a conceptual impossibility. Critics of the argument displayed in the main text could argue that ready

knowability is less than direct recognizability, but certainly enough to put the concept of duty on a solid footing. Hard-boiled internalists would insist that ready knowability either amounts to direct recognizability, or isn't quite enough.

32. See the critique of externalism in chapter 3 of BonJour 1985.

33. I add "good reasons" to allow for the possibilities of internalists who are not evidentialists, and would characterize internal justification not in terms of not evidence but reasons.

34. The evil demon objection to reliabilism can be found in Cohen 1984, pp. 280-82, Foley 1985, Ginet 1985, and Lehrer 1990, p. 166.

35. Harman 1977, p. 17.

36. Harman 1984, p. 33. Harman 1984, p. 33.

37. At the beginning of his 1977, Goldman explicitly states his analytic goal: to give necessary and sufficient conditions of epistemic justification in non-epistemic terms.

38. See Chisholm 1989, p. 61f, where Chisholm makes it abundantly clear that he intends his "formal epistemic principles" to state what epistemic justification supervenes on. See also Steup 1996, chapter 9, where I argue that, as far as the analytic goal is concerned, there is surprising overlap between the internalist Chisholm and the externalist Goldman.

39. For recent literature on the naturalization of epistemology, see the Kornblith 1999 and Feldman 1999.

40. Thus Chisholm writes: "According to [the] traditional conception of "internal" epistemic justification, there is no *logical* connection between epistemic justification and truth. A belief may be internally justified and yet be *false*. This consequence is not acceptable to the externalist. He feels that an adequate account of epistemic justification should exhibit *some* logical connection between epistemic justification and truth." Chisholm 1989, p. 76f. See also Fumerton 1995, pp. 200-203.

41. An externalist alternative to reliabilism is Plantinga's proper functionalism. See Plantinga 1993a and 1993b.

42. It should be mentioned, however, that Alston also makes an effort to appreciate the appeal of internalism. See pp. 227-248 in his 1989.

43. Alston 1993, p. 9.

44. For a discussion of Dretske's question, see Almeder 1998, p. 132-136.

45. Alston, for example, endorses the view that animals and small children cannot have justified beliefs. He writes: "Lower animals, very small children, and idiots acquire and utilize much perceptual knowledge concerning the immediate environment; otherwise they would not be able to move around in it successfully. But they are not capable of acting in the light rules. So [justification as a normative property] is at best a necessary condition for the knowledge possessed by the likes of normal mature human beings." (1989, p. 173) I am inclined to concur with Alston. Although animals do of course have sensory experiences, I do not think that these experiences constitute *evidence* for them, for I take the concept of evidence to have a deontological aspect. A subject doesn't have evidence for *p* simply by virtue of being, for example, in a sensory state of the right sort. Rather, such a sensory state is evidence only if it *entitles* the subject, or makes it *permissible* for her, to believe that *p*. But animals are not subject to entitlements or permissions of that sort. I would, therefore, reject the suggestion that animals and little children can have evidence. For a contrary view, see Russell 2001.

46. Degettierization is an external matter because gettierization is an external matter. And gettierization is an external matter because a subject who is in a Gettier-type situation cannot tell on reflection (recognize directly) that she is in such a situation. On reflection, such a subject would have to come to the conclusion that she has knowledge.

47. I think it would be fair to say, however, that the subject matter of traditional epistemology has been IK rather than EK. Of course, this is not by itself a reason to prefer IK, since it might be a reflection of the shortcomings of traditional epistemology instead of an indication of the superiority of IK.

48. There are alternative approaches to the analysis of knowledge which I did not discuss in this article. First of all, I should mention Plantinga's proper functionalism, as represented by his 1993a and 1993b. I should also mention Linda Zagzebski's recent defense of virtue epistemology. Zagzebski 1996 and 1999. The virtue approach is also advocated in Goldman 1991, various papers in Sosa 1991, and Greco 1993.

Naturalized Epistemology

Naturalized epistemology is best seen as a cluster of views according to which epistemology is closely connected to natural science. Some advocates of naturalized epistemology emphasize methodological issues, arguing that epistemologists must make use of results from the sciences that study human reasoning in pursuing epistemological questions. The most extreme view along these lines recommends replacing traditional epistemology with the psychological study of how we reason. A more modest view recommends that philosophers make use of results from sciences studying cognition to resolve epistemological issues. A rather different form of naturalized epistemology is about the content of paradigmatically epistemological statements. Advocates of this kind of naturalized epistemology propose accounts of these statements entirely in terms of scientifically respectable objects and properties. In this they seem to contrast with more traditional epistemologists whose accounts make free use of evaluative terms such as "good reasons" and "adequate evidence". The significance of the claims of advocates of naturalized epistemology can best be appreciated by seeing them as a reaction to the methods and views that have been prominent in much of the twentieth century.

---

1. Background

A great deal of work in epistemology is devoted to two projects: replying to arguments for skepticism and analyzing key epistemological concepts. Although the discussion of skepticism goes back to ancient times, much of the contemporary thought on the topic is a reaction to Descartes. According to the Cartesian picture, if we have knowledge of the world around us, this knowledge is ultimately traceable to our knowledge of our own experiences. We know how we are experiencing the world, and somehow we reason from this knowledge out to the world. There is, however, a possibility of error in such reasoning.

Our experiences might result from dreams, hallucinations, or the manipulations of an evil demon or his modern counterpart, an evil neuroscientist artificially stimulating a bodiless brain in a vat. Arguments beginning with premises involving hypotheses such as these yield skeptical conclusions. Other skeptical arguments begin with premises about more routine sorts of errors and confusions. These arguments call into question apparent knowledge gained by ordinary people in ordinary circumstances as well as apparent knowledge gained through scientific inquiry. Epistemologists continue to try to identify precisely the structure of these skeptical arguments and the assumptions about knowledge and the world that they rely on. Traditional epistemologists, that is, those who do not advocate naturalizing epistemology, typically carry out this activity in their armchairs. They often see the scientific study of our cognitive systems as at best only distantly related to their effort to reply to skeptical arguments.

Arguments for skepticism rely, implicitly or explicitly, on assumptions about what is required for knowledge. Hence, consideration of those arguments invites analysis of what is necessary for knowledge. Widely shared views imply that for a person to know a proposition to be true, the person must have a well justified belief in the proposition and the proposition must in fact be true. Independent interest in what differentiates knowledge from mere true belief and shared opinion also generates interest in questions about the analysis of knowledge, as well as its key components. These analyses are intended to state necessary and sufficient conditions for the application of the concept. The details of the many analyses of knowledge epistemologists have offered are not crucial for present purposes, nor are the details of the varying accounts of justification that have occupied center stage in the epistemological literature. Section 4 will review the general differences between the sorts of analyses some naturalists propose and more traditional purportedly non-natural analyses. The central point to be reviewed in Sections 2 and 3 turns on the fact that the discussion of these analyses has typically gone on by means of reflection on possible cases. Epistemologists describe possible cases, consult their intuitions about whether the cases would be cases of knowledge or not, and decide on that basis whether or not the cases show the proposed analysis to fail. Once again, the task is carried out in the epistemologist's armchair, without the aid of science. It is this method of inquiry to which some naturalists object.

2. Replacement Naturalism

The source of much of the recent interest in Naturalized Epistemology is W.V.O Quine's celebrated essay, "Epistemology Naturalized" (Quine, 1969). Quine begins this essay by saying that "Epistemology is concerned with the foundations of science." In an effort to show that science has an adequate foundation, epistemologists attempted to derive statements about the world around us from statements about our own sensations. Given that we are certain about our own sensations, if we could strictly derive our beliefs about the world from our beliefs about sensations, we could then be certain of the derived truths about the world as well. We would then have a firm foundation for both everyday knowledge and scientific knowledge. Quine argues that such efforts to ground our beliefs about the world have failed. The proposed derivations just don't work. Virtually all contemporary philosophers agree. Quine concludes that the traditional effort to respond to skepticism is a failure and recommends what on the surface seems to be the abandonment of epistemology altogether. He apparently thinks that the failure of this sort of foundationalism shows that epistemology is impossible. He writes:

> The stimulation of his sensory receptors is all the evidence anybody has had to go on, ultimately, in arriving at his picture of the world. Why not just see how this construction really proceeds? Why not settle for psychology? (Quine, 1969: 75)

Quine seems to be recommending that we abandon the effort to show that we do in fact have knowledge and that we instead study the ways in which we form beliefs. His proposal is that we study the psychological processes that take us from sensory stimulations to beliefs about the world. He elaborates on this idea in a widely quoted passage:

> Epistemology, or something like it, simply falls into place as a chapter of psychology and hence of natural science. It studies a natural phenomenon, viz., a physical human subject. This human subject is accorded a certain experimentally controlled input -- certain patterns of irradiation in assorted frequencies, for instance -- and in the fullness of time the subject delivers as output a description of the three-dimensional external world and its history. The relation between the meager input and the torrential output is a relation that we are prompted to study for somewhat the same reasons that always prompted epistemology: namely, in order to see how evidence relates to theory, and in what ways one's theory of nature transcends any available evidence...But a conspicuous difference between old epistemology and the epistemological enterprise in this new psychological setting is that we can now make free use of empirical psychology. (Quine, 1969: 82-3)

As Jaegwon Kim points out in a widely cited critical discussion of Quine, another conspicuous difference between traditional epistemology and what Quine recommends is that they study strikingly different topics (Kim, 1988: 390). The old epistemology was interested in questions about rationality, justification, and knowledge. The central questions concerned whether an epistemic support relation--a justifying relation--holds between our basic evidence and our beliefs about the world. Analysis of some of the arguments for skepticism reveals that they rely on the view that our evidence supports our beliefs only if our beliefs are deducible from that evidence. Seeing that they are not, many epistemologists are drawn to investigate other accounts of the epistemic support relation, accounts that allow for the possibility that our beliefs about the world are well supported by our sensory evidence, even if they are not strictly derivable from that evidence. As Kim sees it, Quine has proposed ignoring these questions about epistemic support and investigating instead the causal connections between our sensory evidence and our beliefs about the world. Thus, if we follow the Quinean recommendation, we will study the same relata--our basic evidence and our beliefs about the world. However, we will study a different relation. In the original case, we looked to see if there was an epistemic support relation between the data and the beliefs. In the new case, we look to see the nature of the causal connection between them.

The Quinean view that we should abandon epistemology for psychology is not widely accepted by contemporary naturalists in epistemology. (See Almeder, 1998; BonJour, 1994; Foley, 1994; Fumerton, 1994.) Even Quine's later views were more moderate (Quine, 1990). Perhaps this is because questions about the quality of our reasons for our beliefs about the world strike even naturalists as perfectly good questions, questions deserving of investigation and analysis. Perhaps it is because new views about the

nature of knowledge and justification hold that they require the use of processes and methods that reliably lead to truth rather than recognizably good reasons. Whether we actually use such processes and methods seems to be a perfectly good question. In any case, Quinean Replacement Naturalism finds relatively few supporters.

One recent author who does defend a view close to Quine's is Hilary Kornblith. Kornblith contends that once traditional epistemologists admit that the Cartesian program of deriving beliefs about the world from certain foundations fails, they end up endorsing as legitimate whatever principles enable them to ratify the beliefs they started with. He writes,

> Of course knowledge is possible if we weaken the standards for knowledge far enough, in particular if we weaken them until we can show that many of our beliefs then pass the standards. But this seems to be nothing more than an exercise in self-congratulation. Why should we care about knowledge so defined? (Kornblith, 1999: 160)

He goes on to say,

> But if our standards for knowledge are merely designed to allow us to attach the epithet 'knowledge' to whatever it is we pretheoretically believe, then ... the result is an uncritical endorsement of the epistemological status quo. (Kornblith, 1999: 160)

Somewhat similar sentiments, though perhaps for different reasons, can be found in the writings of Stephen Stich. (Stich, 1990)

There is, however, a difference between the view that our pretheoretical beliefs are justified (or amount to knowledge), no matter what else is true of them, and the search for plausible general principles about knowledge and justification that have the result that those beliefs are justified. The principles philosophers put forward, including inference to the best explanation, principles about coherence and the conservation of belief, and so on, can be assessed and criticized. Few armchair epistemologists say that "whatever it is we pretheoretically believe" amounts to knowledge. Virtually all epistemologists agree that many everyday beliefs fall short of what's needed for justification and knowledge. Some conclude that knowledge is less common than one would initially think. By reflecting carefully on what they take to be realistic examples, they attempt to identify what is good about possible ways of reasoning. By calling our attention to the reasoning that withstands scrutiny and reflection, they can contribute to an effort to help us improve. So many defenders of traditional epistemology would deny that they are simply endorsing the status quo. (See Feldman, 1999)

3. Cooperative Naturalism

Although Quine's Replacement Naturalism is not widely accepted, a more modest descendant of his view is extremely popular. This view, Cooperative Naturalism, holds that, while there are evaluative questions

to pursue, empirical results from psychology concerning how we actually think and reason are essential or useful for making progress in addressing evaluative questions. A representative claim of this sort can be found in Susan Haack's *Evidence and Inquiry*, " ... the results from the sciences of cognition may be relevant to, and may be legitimately used in the resolution of traditional epistemological problems" (Haack, 1993: 118). Many philosophers who are more favorably disposed to naturalism than Haack is have voiced similar sentiments. (For example, Goldman, 1992; Stich and Nisbett, 1980: 118; Harman, 1986: 7; Kornblith, 1994: 7.)

What role empirical results can play in epistemology depends in large part on what counts as epistemology. Philip Kitcher's 1992 article, "The Naturalists Return," is a long and comprehensive study of naturalism in epistemology, arguing in part that the apsychologistic tendencies of the 20th century are in fact departures from what was standard in philosophy. Kitcher asks, "How could our psychological and biological capacities and limitations *fail* to be relevant to the study of human knowledge?" (Kitcher, 1992: 58) Obviously, empirical work is relevant to "the study of human knowledge." But this shows its relevance to epistemology only if epistemology is itself as broad as the study of human knowledge. If, however, there are specifically philosophical questions about knowledge, and epistemology is the study of those questions, then the relevance of empirical work about such things as our psychological and biological capacities remains open for debate. Disputes about which questions count as philosophical are likely to be futile. However, it is possible to examine fruitfully the merits of Cooperative Naturalism with respect to some of the issues typically addressed by epistemologists.

In thinking about the role of empirical information in epistemology it is helpful to keep in mind the fact that there are at least three possible views about the potential sources of information for epistemological theorizing, rather than the two that are sometimes identified. Some philosophers seem to be *a priorists*, in that they think that only what can be known *a priori* is relevant to epistemological questions. Other philosophers are *armchair epistemologists*, since they are willing to rely on common sense empirical knowledge -- what can be known from one's armchair, as well as *a priori* information. And *scientific epistemologists* proclaim the value of (or need for) the results from empirical studies for epistemology. This three way classification complicates the discussion of Cooperative Naturalism. If Cooperative Naturalism is the view that empirical information is important for resolving epistemological issues, then armchair epistemologists can accept it. However, if Cooperative Naturalism is the view that detailed information from the empirical sciences is important for epistemology, then armchair epistemologists are likely not to agree. There is no point in arguing about what Cooperative Naturalism "really" is. It will be enough to notice these different possibilities.

Traditional epistemologists often attempt to reply to arguments for skepticism without appeal to information available from the sciences. The arguments they consider typically include premises of two sorts. Premises of one sort specify some necessary condition for knowledge. Premises of the other sort say that people's beliefs never, or rarely, satisfy that necessary condition, or perhaps that they can't satisfy that condition. To the extent that an evaluation of the skeptical argument focuses on a premise of the first sort, *a priorists* will be often be in a position to carry out the task. A good analysis of knowledge will enable them to determine whether knowledge really does have the necessary condition the argument describes. Premises of this sort are in fact the focus of a good deal of the traditional debate. Thus, there

are debates about whether knowledge and justification require conclusive reasons or merely very strong reasons, whether they require reasons at all rather than mere reliability or causal connectedness, whether the fact that a belief provides a good explanation of some data, or is natural, or is widely accepted provide epistemic support for that belief. It is not clear that empirical studies of how we actually reason help with these debates. They can be carried out in the armchair.

Traditionalists often turn their attention to our knowledge in specific domains. They wonder whether, given the sort of basic evidence we have, can we know about other minds, about right and wrong, or about religious matters. They might assume, for example, that our evidence for our beliefs about the mental states of others consists primarily in our observations of their behavior. The key question is then whether that sort of evidence is good evidence for the sort of conclusion we tend to draw. Traditionalists seem to assume the general character of evidence we have for beliefs about other minds (or any of the other categories listed) and then to ask whether that sort of evidence is good enough to justify beliefs of the kind in question. It is not clear that detailed information from empirical studies of human reasoning is needed here. The key issue concerns what is needed for knowledge and whether the general sort of evidence we have - something we can identify from our armchairs - meets the relevant necessary condition for knowledge. Given what they have set out to do, it seems sensible for traditionalists to proceed without scientific input. But it is important to realize that even if traditionalists succeed in refuting arguments for skepticism, they will not thereby show that we do have knowledge. They will only have refuted arguments for the denial of that claim.

It is possible that naturalists tend to focus on different questions: Can we show that we do have knowledge in one area or another? In the various areas do we in fact tend to draw the right conclusions from the evidence we do have? Are the processes we actually use reliable ones? Quine seemed to take the question to be whether our actual scientific beliefs had a firm foundation. The goal was to "reconstruct" our knowledge. There is no doubt that answering these questions requires empirical input. While we can from our armchairs have some ideas about the sorts of inferences we make and the reliability of the processes that occur in us, detailed scientific information is needed to have a clear picture of our actual practices. Furthermore, information about the sorts of errors and mistakes we are apt to make about specific topics is vital to assessing the merits of our actual beliefs about those topics.

Claims to the effect that actual people know actual facts about the world are contingent propositions about the world. They cannot be known a priori. Perhaps such things can be known from our armchairs, since we can know quite a bit from our armchairs. It is difficult to see why we cannot know some things about knowledge from our armchairs. Still, information from empirical sciences cannot be irrelevant to issues about what people actually know. We might plausibly judge from our armchairs that we have knowledge in some range of cases. It is possible that cognitive science will discover that in some or all of these cases our beliefs result from bizarre, thoroughly unreliable, deviant causal chains. If that were to happen, we might learn that we lack knowledge in cases where we thought we had it. Though the possibility that we will learn such things in a variety of familiar cases is extremely small, it is not zero. So empirical results could overturn our judgments about these cases. Thus, if it is epistemology's business to make judgments about whether actual people have knowledge in actual cases, and Cooperative Naturalism is the view that empirical information from the natural sciences is potentially

relevant to those judgments, then Cooperative Naturalism is unquestionably true. What would be remarkable about this is that anyone ever denied it.

Some traditional epistemologists give the impression that they simply assume that we do have knowledge and that no empirical information can overturn that judgment. The claim, or assumption, they make is that we know pretty much what we think we know. A representative formulation of this approach can be found in John Pollock's *Contemporary Theories of Knowledge*. Pollock writes:

> In typical skeptical arguments, we invariably find that we are more certain of the of the knowledge seemingly denied us than we are of some of the premises. Thus it is not reasonable to adopt the skeptical conclusion that we do not have that knowledge. The rational stance is instead to deny one or more of the premises. (Pollock, 1986: 6)

Pollock goes on to say that contemporary epistemologists largely see figuring out what knowledge is as their goal, rather than refuting skepticism. As he puts it, we "need not refute the skeptic - we already know that the skeptic is wrong" (Pollock, 1986: 6). This view, of course, has its similarities to views endorsed by G. E. Moore, and it is by no means uncommon. More generally, many epistemologists proceed on the assumption that we do know pretty much what we think we know, and thus on the assumption that skepticism is false. It may seem that this position, or this attitude, rules out the possibility that empirical results will overturn their philosophical starting point. (For discussion, see Kornblith, 1988.)

It is not clear, however, that the philosophers who take this position really do need to say anything quite so strong. What they may be committed to, in fact, is the more modest claim that no abstract philosophical claim is initially more plausible than the claim that we do have knowledge in a typical range of actual cases. They need not be committed to the more extreme, and quite implausible, claim that no empirical results could possibly show that we lack knowledge in particular actual cases. Surely empirical results could show that any contingent claim to knowledge that we make is false, either by showing that the thing we claim to know is false or by showing that our belief in that fact arose in some untoward way. The Moorean assumption is better taken to be a position toward highly abstract philosophical arguments for skepticism, typically arguments that imply that we lack knowledge no matter what the facts in the world are. It may be a mistake to reject these arguments out of hand. But whatever we say about such arguments, it would be mistake to attribute to Pollock, Moore, and others who share their views the idea that specific claims about what we know cannot be overthrown on the basis of empirical information. Nothing about their philosophical positions requires them to maintain that extreme view.

On a related point, Philip Kitcher takes tradtionalists to hold that "our favored logical principles are prescriptions for thought" (Kitcher, 1992: 63). But he thinks that the mere fact that we favor certain logical principles is of no value in establishing that they are meritorious principles. Our principles are good ones only if they actually do enable us to attain our epistemic ends. "Simply asserting that [certain rules] unfold our conception of rationality will be beside the crucial point" (Kitcher, 1992: 63). What

needs to be determined is whether our principles actually get us to the truth, and empirical inquiry is needed to find that out. So, as he sees it, traditionalists simply endorse the principles we favor whereas naturalists are willing to put those principles to empirical tests.

Kitcher illustrates his point by means of Hume's problem of induction. Hume famously asked whether we have any good reason to believe the conclusions of our inductive arguments. We notice that all observed instances of some sort of object have had a certain property and we infer that the next object of that kind will have that property. Our premise does not entail our conclusion and it turns out that it is extraordinarily difficult to justify these inductive inferences in a way that does not illicitly rely on induction itself. One solution to the problem, associated with Peter Strawson (1952), is that "adopting the inductive practices and principles that we do is constitutive of our concept of rationality." But, Kitcher asks, "why should we treat our current concept of rationality as privileged?" (Kitcher, 1992: 63). After all, rival societies might have rival conceptions. Anti-inductivists could proclaim their practices rational because they are constitutive of their conception of rationality. As Stephen Stich asks, "Why should we care one whit whether the cognitive processes we use are sanctioned by [our] evaluative concepts?" (Stich, 1990: 92).

Once again, it is possible that the debate between naturalists and traditionalists results in part from an emphasis on different questions. One way to view the issue about induction that Hume raised makes it a very general issue about whether it is ever reasonable to use past, or unobserved, cases as the basis for beliefs about future, or observed cases. The Strawsonian view he mentions says that it is, and defends this on the basis of claims about our concept of rationality. Kitcher takes this to be a defense of our adoption of "the inductive practices and principles" that we actually use. If the principles to which he refers are more specific principles licensing particular inductive inferences, then it may be that they are contingent principles that cannot be justified by *a priori* or even armchair methods. Kitcher is right to object to philosophers who contend that these lower level principles are necessary consequences of our concept of rationality may be mistaken. Still, Strawson may have been right about the more general issue about the rationality of using past cases as the basis for belief about future cases. Analogously, there may be some general issues about the rationality of reliance on testimony, but claims about whether particular sources are trustworthy require empirical defense.

4. Substantive Naturalism

Paradigmatic epistemological facts are expressed by sentences using terms such as those on the following list provided by Alvin Goldman:

> justified,
> warranted,
> has (good) grounds,
> has reason (to believe),
> knows that,
> sees that,

> apprehends that,
> is probable (in an epistemic or inductive sense),
> shows that,
> establishes that
> ascertains that.
> (Goldman, 1979: 1-2)

The crucial thing about sentences using these terms are that they seem to do more than merely describe how things are. They say or imply how something is to be evaluated from an epistemological perspective. Traditional epistemologists take these evaluative epistemological sentences to be objectively true or false, and thus they are committed to there being epistemological facts. The status and nature of these facts constitutes a second major issue falling under the heading of epistemological naturalism.

In a discussion of naturalism in ethics Gilbert Harman writes:

> [Ethical naturalism] is the doctrine that moral facts are facts of nature. Naturalism as a general view is the sensible thesis that *all* facts are facts of nature. (Harman, 1977: 17)

Substantive epistemological naturalism is the view that all epistemic facts are natural facts.

This is not informative unless it is supplemented with some account of what counts as a natural fact. One view is that the natural facts include all the facts that a complete science will acknowledge. Another way to characterize the natural facts is to provide a list of representative examples of the sorts of things that count as natural, with the hope that we have at least a reasonably good idea of what else might be included. The two approaches are not incompatible, since the examples might be a list of the sorts of facts science acknowledges. One such list was produced by Alvin Goldman in his classic paper, "What is Justified Belief?" (Goldman, 1979). Though Goldman was not explicitly discussing naturalism in this paper, the things he mentions will serve present purposes quite well. Goldman suggests that the following are non-epistemic terms:

> believes that,
> is true,
> causes,
> it is necessary that,
> implies,
> is deducible from
> is probable (either in the frequency sense or the propensity sense)
> (Goldman, 1979: 2)

He says:

> In general, (purely) doxastic, metaphysical, modal, semantic, or syntactic expressions are

not epistemic. (Goldman, 1979: 2)

Naturalized epistemologists contend that if epistemic terms make sense at all, they must be understood in terms of items such as those on this list. Their view seems to contrast with that of traditional epistemologists, who are content to formulate their analyses using evaluative epistemic terms.

It is possible for naturalists to deny that epistemic sentences report facts at all. Defenders of such a view might contend that the sentences are sheer nonsense. More plausibly, they might argue that they are meaningful but non-factual, perhaps because they are expressions of approval or disapproval of the beliefs and believers or the acts and actors mentioned. There have been some defenses of this view, though more frequently in ethics than in epistemology. (See Gibbard, 1990)

Another approach for naturalists is to argue that epistemic terms can be given naturalistic definitions. For present purposes it will suffice to take a definition of a term to be a statement of logically necessary and sufficient conditions for its application. Familiar accounts of epistemic terms seem to be divisible into those that employ only clearly naturalistic terms and those that do not. Many traditional definitions of epistemic justification make essential use of other evaluative epistemic terms. Thus, it is common to define justification in terms of good reasons, adequate evidence, strong grounds, the right to be sure, and the like. For example, evidentialism holds that a person is justified in believing a proposition at a time if and only if the evidence the person has at that time supports believing that proposition (rather than disbelieving it or suspending judgment about it). This definition appeals to two crucial elements: the evidence a person has at a time and the support relation that can hold between a body of evidence and an attitude toward a proposition.

There is no reason for naturalists to worry about the naturalistic credentials of the idea of evidence possessed. This is not to say that the concept is entirely clear. But there is nothing metaphysically spooky, or even evaluative, about it. The evidence one possesses is some combination or other of the experiences one is having, the memories one has, and the other beliefs one has. It may be that other beliefs count as evidence only if they themselves are justified, but this at most shows that the account of justification will turn out to be recursive. It does not show that this element of the evidentialist definition invokes anything non-natural.

The second component of the evidentialist definition of justification is the idea of evidential support. It is easy enough to give examples of cases in which this relation is supposed to obtain and other cases in which it does not obtain. There may also be some cases that are difficult to assess. Despite this, its naturalistic credentials are in doubt. Evidential support seems to be precisely the sort of relation whose connection to the scientifically identifiable objects and properties is difficult to ascertain. Similar worries apply to accounts of epistemic justification in terms of epistemic duties or rights or in terms of epistemically responsible behavior.

In contrast to evidentialism are causal and reliabilist accounts. The simplest version of the causal theory says that a belief that p is justified when the fact that p is causally connected to the belief that p. This

theory invokes facts, beliefs, and causal connections, all terms acceptable to naturalists. Reliabilism also seems to invoke only naturalistically respectable terms. In its simplest form it holds that a belief is justified provided it is produced by a belief-forming process that reliably leads to true beliefs. More complex forms of reliabilism also appear to be naturalistically acceptable.

These considerations suggest that one aspect of the debate between naturalists and non-naturalists is best understood as a debate about whether knowledge and justification can be understood in naturalistically acceptable causal and reliabilist terms or must be understood in terms of naturalistically suspect evaluative terms. What remains unclear, however, is whether philosophers who defend traditional accounts of justification, such as evidentialism, are committed to any troubling form of non-naturalism.

Defenders of evidentialist accounts are not (or at least need not be) committed to the idea that no naturalistic definitions of the terms they employ in their definitions are possible. It may be that they just have not produced such definitions yet. And even if the terms are not strictly definable, it does not follow that they are not themselves perfectly good naturalistic terms. This is because it remains possible that evaluative epistemic facts *supervene* on naturalistic ones. To say that the evaluative facts supervene on the natural ones is to say that in any two worlds in which all the natural facts are alike, all the evaluative facts are also alike. Alternatively, one might say that facts about the epistemic status of beliefs supervene on natural facts provided that, necessarily, if two believers share all the same natural properties, then same beliefs are justified for them. If this supervenience thesis is true, then, arguably, the epistemic facts depend on the natural facts and, perhaps, they are therefore natural facts.

The supervenience thesis is endorsed by a great many philosophers. A representative assertion of it is:

> ...if a belief is justified, that must be so *because* it has certain factual, non-epistemic properties...That it is a justified belief cannot be a brute fundamental fact... [it] must be grounded in the factual descriptive properties of that particular belief. (Kim, 1988: 399)

This quotation comes from Kim's critical discussion of Quine's "Naturalized Epistemology." One can find similar passages in the writings of philosophers, including many who would not typically be regarded as naturalists. (Chisholm, 1982: 12; Van Cleve, 1985: 97-101). Indeed, there are very few who deny the supervenience thesis. One who does is Keith Lehrer (Lehrer, 1997).

So, the supervenience thesis is widely accepted. There is, of course, considerable disagreement about which facts are central to the supervenience base for epistemic facts. *Evidentialism* holds that the key natural facts that determine whether a belief is justified are facts about the evidence the person has for that belief. The evidence one has is some combination or other of the experiences one is having, the memories one has, and the other beliefs one has. All of these are unquestionably natural facts about a person. And evidentialism holds that necessarily, people who have the same evidence are justified in believing the same things. In other words, the theory is that natural facts about evidence possessed determine epistemic facts. *Reliabilism* holds that the crucial facts in the supervenience base of epistemic facts are facts about the reliability of the causal produce producing or sustaining the belief. These too are

unquestionably natural facts.

If supervening on natural facts is sufficient for making a fact natural, then it follows that it is widely agreed that epistemic facts are natural facts. It difficult to determine whether supervening on what is natural is sufficient for naturalness, but things participants to the debate say can help to clarify the issues. In an extensive review of naturalism in epistemology, James Maffie writes that a key claim of naturalism is that:

> epistemic value is anchored to descriptive fact, no longer entering the world autonomously as brute, fundamental fact...(Maffie, 1990: 284)

One can find comparable claims in the writings of many others. (See Steup, 1996: 185-6; Lycan, 1988: 122) If epistemic facts supervene on unquestionably natural facts, then they do not float free, they are not autonomous, they are not brute facts, they are anchored in the natural world. That seems like a good reason to conclude that they are natural facts.

Of course, some naturalists may contend that a substantive naturalist view must treat epistemic facts as supervening on causal rather than logical facts. (See Kitcher, 1992) Perhaps some support for rejecting the view that anything that supervenes on what's natural is itself natural comes from the fact that this thesis yields the surprising result that the famous ethical non-naturalists were actually naturalists. For example, G. E. Moore would have endorsed the supervenience thesis. However, Kim says that we use the term "naturalism" ambiguously in "ethical naturalism" and "epistemological naturalism". The former requires definitions in natural terms. The latter requires only supervenience. (Kim, 1988: 398) So Kim's view seems to be that, so far as the debate about naturalistic epistemology goes, epistemic facts are natural facts if they supervene on unquestionably natural facts. His view, like nearly all participants to the debate, is that they do.

Even if supervenience of the sort just discussed shows that many epistemic facts are natural facts, a question remains for some traditionalists. In addition to facts about particular people being justified in believing particular propositions, they are committed to the existence of epistemic facts about what beliefs are supported by a particular body of evidence. It remains unclear whether these are natural facts. Traditionalists often regard these facts as necessary truths, and it is their necessity that enables evidentialists to endorse the supervenience thesis. The sentences expressing these epistemic relations express facts - call them *epistemic support* facts. It is legitimate to ask whether they count as natural facts.

If the epistemic support facts are not natural facts, then not all epistemic facts are natural facts and, according to traditionalists, substantive epistemological naturalism is false. If the epistemic support facts are natural facts, and justification is defined in terms of evidence possessed and epistemic support, then justification is defined in entirely natural terms. In that case, evidentialists do not need to rely on supervenience to defend naturalism. (If reliabilists admit that there are epistemic support facts, then they too must account for their status.)

Whether epistemic support facts are natural facts is a difficult and unexplored question. Epistemic support facts are, on many views, necessary truths. On standard definitions of supervenience, it is trivial that necessary truths supervene on natural facts. (They supervene on anything.) Given that supervening on what is natural is sufficient for being natural, it follows that they are natural facts. However, this response seems to avoid the central questions. This is because some traditionalists, notably Roderick Chisholm, assert the existence of a special class of epistemic support facts whose naturalistic status is questionable. Chisholm contends that "there are principles of evidence other than the formal principles of deductive logic and inductive logic" (Chisholm, 1977: 67). For example, Chisholm held that there were special principles about perceptual evidence along the lines of:

> (**R**). Being in the state of seeming to see something red (being appeared to redly) is evidence for the proposition that one really does see something red.

The evidential support described in (R) is, of course, defeasible. One could have evidence that one is not really seeing something red in spite of being appeared to redly. The key thing about (R) is that it is not, or at least not obviously, an instance of some general deductive or probabilistic principle. It is not a principle of logic. It is, instead, a fundamental principle of epistemology. Thus, at least some evidentialists seem to be committed to there being fundamental epistemic principles, or evidential support relations, that differ from any deductive or probabilistic relations and cannot be defined in terms of any complex of psychological relations and familiar logical relations. Naturalists are apt to find this all highly suspect.

Some traditionalists go further. They hold that to be justified in a belief not only must we have evidence that supports the belief, but we must "grasp" the connection between the evidence and the proposition believed (Fumerton, 1995: 183-224) This grasping of evidential relations may strike some naturalists as exceedingly dubious. However, it is best not to see the issue here as one about naturalism itself. If traditionalists say that there is a special sort of grasping or understanding or acquaintance with epistemic support facts and naturalists deny that there is any such thing, it is seriously misleading to attribute some sort of non-naturalism to the traditionalists. They are making a claim about what natural relations there actually are. Their view is that acquaintance is a particularly fundamental sort of psychological, hence natural, relation. Possibly some naturalists will deny that any such grasping of connections occurs, but the issue here is something like an issue that arises in discussions of extra-sensory perception. Clear-headed defenders of the view that we are capable of perceiving things that ordinary psychology would declare us incapable of perceiving differ with their opponents over what natural relations (or abilities) we have. While some may try to cast their view in mystical language, there is no reason to invoke non-naturalism here. If a hard-headed naturalist became convinced that some people did have some abilities previously thought to be beyond us, the response should be a change in views about what nature is like, not a renunciation of naturalism.

Still, there remains the question of the status of facts like (R). As noted, Chisholm regarded it as a special epistemic principle. But not all traditionalists must follow suit. They might argue that these principles are special cases of naturalistically acceptable general principles. For example, one could argue that (R)

follows from some general principle about best explanations. Or perhaps it really does have inductive support. Support from appeals to conservatism (what we already believe), what we naturally believe, what is generally accepted, and other factors are possible. Philosophers who endorse any such view can proudly proclaim themselves substantive naturalists.

Chisholm, of course, would not accept this. He thought that there were fundamental epistemic principles that could not be explained in any such terms. Perhaps this counts as non-naturalism. Even here, however, the issues are less than fully clear. Chisholm apparently thought that, in addition to deductive and probabilistic connections, there was another species of connection between propositions (or between experiences and propositions). His view was that these relations are part of the real, or natural, world. Some may deny that there are any such relations. This seems, once again, to be a dispute about what there is, not a dispute about whether there is something beyond what is natural. In other words, if Chisholm is right, it is quite unclear why terms such as "supports" and other epistemic terms do not belong on the list of naturalistically acceptable terms in the first place. If they do, then even Chisholm can plausibly maintain that epistemic support facts are natural facts. If so, then almost all epistemologists are substantive naturalists.

Social Epistemology

Social epistemology is the study of the social dimensions of knowledge or information. There is little consensus, however, on what the term "knowledge" comprehends, what is the scope of the "social", or what the style or purpose of the study should be. According to some writers, social epistemology should retain the same general mission as classical epistemology, revamped in the recognition that classical epistemology was too individualistic. According to other writers, social epistemology should be a more radical departure from classical epistemology, a successor discipline that would replace epistemology as traditionally conceived. The classical approach could be realized in at least two forms. One would emphasize the traditional epistemic goal of acquiring true beliefs. It would study social practices in terms of their impact on the truth-values of agents' beliefs. A second version of the classical approach would focus on the epistemic goal of having justified or rational beliefs. Applied to the social realm, it might concentrate, for example, on when a cognitive agent is justified or warranted in accepting the statements and opinions of others. Proponents of the anti-classical approach have little or no use for concepts like truth and justification. In addressing the social dimensions of knowledge, they understand "knowledge" as simply what is believed, or what beliefs are "institutionalized" in this or that community, culture, or context. They seek to identify the social forces and influences responsible for knowledge production so conceived. Social epistemology is theoretically significant because of the central role of society in the knowledge-forming process. It also has practical importance because of its possible role in the redesign of information-related social institutions.

1. History of Social Epistemology

The phrase "social epistemology" does not have a long history of systematic use. It is not difficult, however, to find historical philosophers who made at least brief forays into the social dimensions of knowledge or rational belief. In his dialogue *Charmides*, Plato posed the question of how a layperson can determine whether someone who purports to be an expert in an area really is one. Since dependence on experts or authorities is a problem within the scope of social epistemology, this was a mini-exploration of the subject. The seventeenth and eighteenth century British philosophers John Locke, David Hume, and Thomas Reid devoted portions of their epistemologies -- often just scattered remarks -- to the problem of "testimony": When should cognitive agents rely on the opinions and reports of others? What must a hearer know about a speaker to be entitled to trust his assertions? Locke so emphasized the importance of intellectual self-reliance that he expressed strong doubts about giving authority to the opinions of others (1959, I. iii. 23). Hume took it for granted that we regularly rely on the factual statements of others, but insisted that it is reasonable to do so only to the extent that we have adequate reasons for thinking that these sources are reliable. Hume's empiricism led him to require that these reasons be based on personal observations that establish the veracity of human testimony (Hume 1975, X, 111). Reid, by contrast, claimed that our natural attitude of trusting others is reasonable even if we know little if anything about their reliability. Testimony, at least sincere testimony, is always *prima facie* credible (Reid 1975, VI, xxiv). All of these positions, of course, are epistemological positions. However, they were generally part of an epistemological enterprise that was basically egocentric in orientation, so they are perhaps not ideal or pure paradigms of social epistemology. Nonetheless, they are clear examples of early epistemologies that examined social dimensions of epistemic justification.

A different tradition focused on aspects of knowledge that are "social" in a more sociological or political sense, though members of this tradition less frequently aligned their work to core issues in epistemology. Karl Marx's theory of ideology could well be considered a type of social epistemology. On one interpretation of Marx's conception of "ideology", an ideology is a set of beliefs, a world-view, or a form of consciousness that is in some fashion false or delusive. The cause of these beliefs, and perhaps of their delusiveness, is the social situation and interests of the believers. Since the theory of ideology, so described, is concerned with the truth and falsity of beliefs, it might even be considered a form of *classical* social epistemology.

Karl Mannheim (1936) extended Marx's theory of ideology into a sociology of knowledge. He classed forms of consciousness as ideological when the thoughts of a social group can be traced to the group's social situation or "life conditions" (1936: 78). The descriptive enterprise of tracing these thoughts to the social situation might be construed as social epistemology. The further enterprise of critiquing and dissolving ideological delusions --"Ideologiekritik" -- is surely a form of social epistemology. The critical theory of the Frankfurt School was one attempt, or a family of attempts, to develop this idea. Critical theory aims at emancipation and enlightenment by making agents aware of hidden coercion in their environment, enabling them to determine where their true interests lie (Geuss 1981: 54). In a variant of critical theory, Jurgen Habermas introduced the idea of an "ideal speech situation", a hypothetical situation of absolutely uncoerced and unlimited discussion between completely free and equal human agents (Habermas 1973; Geuss 1981: 65). In some writings Habermas uses the ideal speech situation as a transcendental criterion of truth. Beliefs that agents would agree upon in the ideal speech situation are ipso facto true beliefs (Habermas and Luhmann 1971: 139, 224). Here a social communicational device

is treated as a type of epistemic standard.

Subsequent developments in the sociology of knowledge, and especially in the sociology of science, can also be considered forms of social epistemology. Since science is widely considered the paradigmatic knowledge-producing enterprise, and since epistemology is centrally concerned with knowledge, any endeavor that seeks to identify social determinants of science might plausibly be categorized as a form of social epistemology. Both Mannheim and the sociologist of science Robert Merton (1973) exempted (natural) science from the influence of societal or "existential" factors of the types that influence other categories of beliefs. Science was viewed as a society unto itself, largely autonomous from the rest of society. But later sociologists of science have declined to offer the same exemption. The Edinburgh School contends that all scientific beliefs are on a par with other beliefs in terms of their causes. Barry Barnes and David Bloor formulated a "symmetry" or "equivalence" postulate, according to which all beliefs are on a par with respect to the causes of their credibility (1982). Many historical case studies conducted in this tradition have tried to show how scientists too are swayed by class interests, political interests, and other factors usually considered "external" to pure science (Forman 1971; Shapin 1975; Mackenzie 1981). Thomas Kuhn (1962/1970) is thought to have shown that purely objective considerations can never settle disputes between competing scientific theories or paradigms, and hence scientific beliefs must be influenced by "social factors". Kuhn's descriptions of the practices of scientific research communities, especially descriptions of the inculcation and preservation of paradigms during periods of "normal" science, were clear and influential examples of a social analysis of science, especially when contrasted with the positivist tradition of analysis. Michel Foucault developed a radically political view of knowledge and science, arguing that practices of so-called knowledge-seeking, especially in the modern world, really serve the aims of power and social domination (1977, 1980). All of these writers may be considered "social epistemologists", although they themselves do not employ this phrase.

Perhaps the first use of the phrase "social epistemology" appears in the writings of a library scientist, Jesse Shera, who in turn credits his associate Margaret Egan. "[S]ocial epistemology," says Shera, "is the study of knowledge in society.... The focus of this discipline should be upon the production, flow, integration, and consumption of all forms of communicated thought throughout the entire social fabric" (1970: 86). Shera was particularly interested in the affinity between social epistemology and librarianship. He did not, however, construct a conception of social epistemology with very definite philosophical or social-scientific contours. What might such contours be?

2. Classical Approaches

Classical epistemology has been concerned with the pursuit of truth. How can an individual engage in cognitive activity so as to arrive at true belief and avoid false belief? This was the task Rene Descartes set for himself in his *Discourse on the Method of Rightly Conducting the Reason and Seeking for Truth in the Sciences* (1637/1955) and in his *Meditations on First Philosophy* (1641/1955). Classical epistemology has equally been concerned with rationality or epistemic justification, as suggested by part of the title of the *Discourse*. A person might rightly conduct her reason in the search for truth but not

succeed in getting the truth. However, as long as she forms a belief by a proper use of reason -- and perhaps by proper use of other faculties like perception and memory -- then her belief is rationally warranted or justified. Classical epistemologists all regard this as one sort of epistemic desideratum. Furthermore, according to the standard account of knowledge in classical epistemology, for a person to *know* a proposition, she must believe it, it must be true, and the belief in it must be justified or rationally warranted. So if epistemology is the study of knowledge, and more specifically the study of how knowledge can be attained, it must also be the study of how true and justified belief can be attained. Epistemological projects restricted to just one of these dimensions -- truth or justification -- would also fit the classical mold.

The foregoing remarks apply to classical epistemology in its "individualist" guise. What type of epistemology does one get if one tries to "socialize" classical epistemology? One gets some sort of social angle on the pursuit of true belief and/or the pursuit of justified belief. Some projects in social epistemology have adopted precisely these themes.

Perhaps the first formulation of a truth-oriented social epistemology is found in writings by Alvin Goldman from the late 1970s through the mid-1980s (Goldman 1978, 1986, 1987). Goldman there proposes to divide epistemology into two branches: individual epistemology and social epistemology (or "epistemics"). Both branches would seek to identify and assess processes, methods or practices in terms of their contributions -- positive or negative -- to the production of true belief. Individual epistemology would identify and evaluate psychological processes that occur within the epistemic subject. Social epistemology would identify and evaluate social processes by which epistemic subjects interact with other agents who exert causal influence on their beliefs. The communicational acts of other agents and the institutional structures that guide or frame such communicational acts would be prime examples of social-epistemic practices that would be studied within social epistemology. In Goldman's subsequent book, *Knowledge in a Social World* (1999), this conception of social epistemology is developed in detail. It is argued that, both in everyday life and in specialized arenas such as science, law, and education, a certain value is placed on having true beliefs rather than false beliefs or no opinion (uncertainty). This type of value is called "veritistic value", and a measure of veritistic value is proposed. The rest of the book examines types of social practices that make positive or negative contributions toward increasing veritistic value. Types of practices examined include speech practices of reporting and arguing, market and non-market mechanisms that regulate the flow of speech, types of information technologies, assigning scientific credit and guiding scientific inquiries with an eye to credit, trial procedures or legal adjudication systems, and systems that disseminate political information about electoral candidates.

The veritistic approach to social epistemology aims to be evaluative or normative rather than purely descriptive or explanatory. It seeks to evaluate actual and prospective practices in terms of their impacts on true versus false beliefs. Although truth may have no explanatory role to play in the social studies of knowledge, it can play a regulative role. How can truth play a regulative role, it may be asked, unless we already have ways of deciding what is true? How can the social epistemologist assess the truth-propensity of a practice unless she already has a method of determining whether the beliefs caused by the practice are true or false? But if she has such a method of determination, why bother with social epistemology? In answer to these questions, it is sometimes possible to demonstrate mathematically that

a certain practice would have certain veritistic properties. For example, Goldman indicates that a particular (difficult to instantiate) practice of Bayesian inference has a general propensity, on average, to increase the veritistic properties of one's beliefs (Goldman 1999: 115-123). Similarly, it can be shown mathematically that a certain mode of amalgamating expert opinions in a group yields greater group accuracy than other modes of amalgamation (Shapley and Grofman 1984; Goldman 1999: 81-82). Finally, a practice can sometimes be judged veritistically unsatisfactory when later and better evidence shows that many judgments issued under its aegis were false. The medieval practice of trial by ordeal was abandoned in part because it was shown that the ordeal had produced numerous erroneous judgments of guilt. This emerged when voluntary confessions were later obtained from different people, or new eye-witnesses came forward.

Philip Kitcher has also developed the social epistemology of science from a truth-oriented perspective. One of his chief concerns has been the division of cognitive labor (Kitcher 1990, 1993: chap. 8). The progress of science will be optimized, says Kitcher, when there is an optimal distribution of effort within the scientific community. It may be better for a scientific community to attack a given problem by encouraging some members to pursue one strategy and others to pursue another, rather than all pursue the single most promising strategy. In saying that progress will be "optimized", it is meant that it will be optimized in terms of getting true answers to significant scientific questions. In *The Advancement of Science* (1993) Kitcher constructs the notion of a "consensus practice", a social practice built up from individual practices consisting of an individual's beliefs, the informants he regards as credible, the methodology of scientific reasoning he accepts, and so forth. A "core" consensus practice consists of the elements of individual practices common to all members of the community. A "virtual" consensus practice is a practice generated by taking into account the statements, methodologies, etc. that members accept "indirectly" by deferring to other scientists as authorities. Kitcher then constructs a family of notions of scientific "progress", and he characterizes progress in terms of improvements of consensus practices in getting significant truth and achieving explanatory success.

Feminist epistemologists often embrace the idea of social epistemology. However, many of them strongly criticize traditional epistemology and view it as a poor model for feminist epistemology. At least a few feminist epistemologists, however, take a fundamentally truth-oriented position. Elizabeth Anderson explicitly views feminist epistemology as a branch of social epistemology (1995: 54). Furthermore, when she proceeds to explain the aim of social epistemology, she identifies it as the aim of promoting our reliable, i.e., truth-conducive, processes of belief formation and checking or canceling out our unreliable belief-forming processes (1995: 55). Thus, the fundamental aim is the classical one of seeking true beliefs and avoiding false ones.

Thus far our examples of classically-oriented social epistemology center on the truth aim. What about the aim of epistemic justification or rationality? As indicated earlier, the problem of testimony is a problem about justification: What makes a hearer *justified* in accepting a report or other factual statement by a speaker? In the last two decades, testimony has become an active area of epistemological investigation. Although testimony theorists do not generally use the phrase "social epistemology" to describe their inquiry, that seems to be an appropriate label (see Schmitt 1994a).

According to "reductionism" about testimony, a hearer H is justified or warranted in accepting a speaker's report or factual statement only if H is justified is believing that the speaker is reliable and sincere, where the latter justification rests on sources other than testimony itself. In other words, testimony can only be a derivative source of epistemic warrant, not a "basic" source like perception, memory, or inductive inference. This reductionist view was held by Hume. In contrast to reductionism, there is the view that testimony is itself a "basic" source of warrant. A hearer has default, or *prima facie*, warrant in believing what a speaker says, no matter how little he knows about the speaker's reliability and sincerity. Of course, evidence of the speaker's unreliability or insincerity may defeat or override his *prima facie* warrant for acceptance. But that does not conflict with the claim that testimony *per se* is a basic source of evidence. C. A. J. Coady (1992) argues that reductionism would lead to widespread skepticism, because people do not generally have enough testimony-free evidence of testifiers' trustworthiness to confer the sort of justification demanded by reductionism. This argument is amplified and qualified by Elizabeth Fricker (1995). Others such as Tyler Burge (1993) and Richard Foley (1994) have argued that reductionism is in any case inadequately motivated.

Another form of justificationist social epistemology that is broadly classical in conception is that of Helen Longino (1990, 1993). In Longino's conception, a scientific belief is justified to the extent that it results from the application of "objective" methods. "To say that a theory or hypothesis was accepted on the basis of objective methods does not guarantee that it is true, but it does--if anything does--justify us in asserting that it is true" (1993: 268). The social character of Longino's approach is reflected in her insistence that objectivity is a characteristic of a community's scientific practice rather than a characteristic of an individual scientist, for objectivity refers to the avoidance of individual subjectivity or bias. Longino develops an account of objectivity that is tied to critical discourse. Objectivity in a scientific community, she says, would require four features: recognized avenues for criticism, responsiveness of beliefs to critical discussion, shared standards of responsiveness to criticism, and equality of intellectual authority.

3. Anti-Classical Approaches

Many researchers in the social studies of knowledge reject or ignore such classical concerns of epistemology as truth, justification, and rationality. It is acknowledged, of course, that various communities and cultures speak the language of truth, justification, or rationality, but the researchers in question do not find such concepts legitimate or useful for their own purposes. They seek to describe and understand a selected community's norms of rationality, like anthropologists describing the norms or mores of an alien culture. But they reject the notion that there are any universal or "objective" norms of rationality, or criteria of truth, that they themselves could appropriately invoke. As Barry Barnes and David Bloor put it, "there are no context-free or super-cultural norms of rationality" (1982: 27). So they are not prepared to decree that certain practices are more rational or more truth-conducive than others. In other words, they officially decline to make any judgments about the epistemic properties of various belief-forming practices (though the debunking connotations of their work, discussed below, may belie this stance). They indicate that such judgments would have no culture-free basis or foundation.

They are, nonetheless, clearly interested in belief-forming practices. If we use the term "knowledge" for any sort of belief (or at least for "institutionalized" belief), whether true or false, justified or unjustified, then they can be said to be investigators of knowledge. Since they are specifically interested in social influences on knowledge (so understood), they plausibly qualify as social epistemologists. They do not typically apply this label to themselves, perhaps in recognition that what was traditionally called "epistemology" had different purposes or aspirations. But if the old aspirations must be abandoned -- as Richard Rorty (1979) explicitly argued -- why not use the old label for the new type of project? For this reason, researchers in the social studies of science, or science and technology studies, will here be considered social epistemologists. There is, however, an additional reason why some of these writers might be called social epistemologists. Some claim to derive epistemologically significant conclusions (in the classical sense of "epistemology") from their sociological or anthropological investigations. Two examples are cases in point. First, as indicated earlier, historical case studies undertaken by members of the Edinburgh School attempt to show that scientists are heavily influenced by social factors "external" to the proper business of science. Other social analyses of science try to show how the game of scientific persuasion is really driven by factors resembling battles or political contests, where the outcome depends on the number or strength of one's allies *as contrasted* with, say, genuine epistemic worth. If either of these claims were right, the epistemic status of science as an objective and authoritative source of information would be greatly reduced. This claim, if true, seems to have genuine epistemological significance. Second, some sociologists of science claim to show that scientific "facts" are not "out-there" entities, which obtain independently of the human social interactions, but are mere "fabrications" resulting from those social interactions. This is an epistemological thesis, or at least a metaphysical thesis, of some philosophical significance. So some of these writers seem to have philosophical aspirations, not merely social science aspirations.

Let us begin with the first type of thrust, i.e., attempts to debunk the epistemic authority of science. The debunking of science's epistemic authority, at least by sociologists or historians of science, would have to be accomplished by empirical means, for example, by showing how scientific beliefs were actually produced in this or that socio-historical episode. This is precisely what various historians and sociologists of science purport to accomplish. One challenge to this would be a straightforwardly empirical challenge: Do these historical accounts get matters right? Many debunking efforts by members of the "Strong Programme" in the sociology of science have been disputed by others. In addition, there is an obvious, theoretically more interesting, response. How can these studies establish the debunking conclusions unless the studies themselves have epistemic authority? Yet the studies themselves use some of the very empirical, scientific procedures they purport to debunk. If such procedures are epistemically questionable, the studies' own results should be in question. There is, in other words, a problem of "reflexivity" facing this type of debunking challenge.

Not all sociological approaches are linked to historical case studies. Some offer a more theoretical analysis of how scientists persuade one another of this or that conclusion. For example, Bruno Latour sketches an account of how persuasion is effected in science by marshalling "allies" of substantial reputation on one's own side of a controversy (1987: chap. 1). Can this ostensibly non-epistemic account of science support a successful debunking of its epistemic pretensions? A first point to notice is that any successful debunking of epistemic authority, if explicitly spelled out, must address epistemic issues. It

must be shown that the procedures used by scientists have poor epistemic qualities. But this presupposes that there are objective, *bona fide* epistemic categories, which sociologists of science of Latour's persuasion tend to doubt or deny. If such categories are admitted, the further question arises as to whether persuasion by reference to the numbers of concurring "allies" is really an epistemically bad procedure. Although Latour's military/political vocabulary provides an amusing contrast with conventional characterizations of science, it isn't clear that the practices described are epistemically bad, or sub-rational, practices.

Let us turn now to the social construction of scientific facts. Again there is a question of how this sort of thesis could be established by sociologists. How could any scrutinizing of the activities of human scientists have determinate implications as to whether certain chemical substances, for example, exist independently of these scientists' interactions? Yet this is exactly what Latour and Steve Woolgar imply in their book *Laboratory Life: The [Social] Construction of Scientific Facts* (1979/1986). Latour and Woolgar claim that the "reality [of a scientific entity or fact] is formed as a consequence of [the] stabilization [of a controversy]" (1986: 180). In other words, the reality does not exist prior to the social event of stabilization, but is the result of such stabilization. How can they determine this without being biochemists as opposed to sociologists? How can the study of macro-events of a social nature establish that there do or do not exist certain biochemical substances independently of those macro-events?

In discussing social constructivism, it is essential to distinguish between weak and strong versions. Weak social constructivism is the view that human *representations* of reality -- either linguistic or mental representations -- are social constructs. For example, to say that gender is socially constructed, in this weak version of social constructivism, is to say that people's representations or conceptions of gender are socially constructed. Strong social constructivism claims not only that representations are socially constructed, but that the *entities themselves* to which these representations refer are socially constructed. In other words, not only are scientific representations of certain biochemical substances socially constructed, but the substances themselves are socially constructed. The weak version of social constructivism is quite innocuous, at least in the present context. Only the thesis of strong social constructivism is metaphysically (and, by implication, epistemologically) interesting. It is this sort of metaphysical thesis that Latour and Woolgar seem to endorse.

But there are many problems with this metaphysical thesis. One question is whether social constructivists like Latour and Woolgar mean to be "causal" constructivists or "constitutive" constructivists, in the terminology of Andre Kukla (2000). Causal constructivism is the view that human activity causes and sustains facts about the world, including scientific facts, whereas constitutive constructivism is the view that what we call "facts about the world" are really just facts about human activity (Kukla 2000: 21). Although Latour and Woolgar use the language of causal constructivism, it seems more likely that the doctrine they intend is constitutive constructivism. There are, however, severe philosophical difficulties for constitutive social constructivism as a general metaphysical doctrine, as Kukla explains.

Not all researchers within the social studies of science think of social epistemology as confined to the description and explanation of science. Steve Fuller (1987, 1988, 1999), who champions social epistemology in that very phrase, sees the enterprise as normative: How should the institution of science

be organized and run? What is the best (scientific) means to knowledge production? However, Fuller does not construe "knowledge" in a truth-entailing fashion, and so parts company with classical epistemology. What does he take the end of knowledge production to be? In one place he says that it's a matter of empirical determination what that end is (1987: 177). But if we don't now know the end, how can we try to direct science toward it? And how can one determine science's end empirically? Science might be found to have many different results. Which of them is its "end"?

4. Conceptions of the Social

In what sense is social epistemology "social"? Different writers have different conceptions of the social, and this inevitably leads to different conceptions of social epistemology. In the Marxian tradition and in early forms of the sociology of knowledge, "social factors" referred primarily to various types of "interests": class interests, political interests, or anything else pertaining to the "existential" world of power and politics. Under this conception of the social, it is natural to see social factors as antithetical to "reason". If science is infiltrated by social factors, in this sense, how can it be a successful instrument for getting at truth? Thinking of the relationship between the rational and the social as one of opposition, it is not surprising to find Larry Laudan proposing an "arationality principle": "[T]he sociology of knowledge may step in to explain beliefs if and only if those beliefs cannot be explained in terms of their rational merits" (Laudan 1977: 202).

Can the opposition between the rational and the social be eliminated, or at least relaxed? A first possible move is to allow "interests" to include the private or professional interests of scientists. It seems undeniable that scientists are at least partly driven by a desire for "credit" from their peers (Hull 1988). But won't private and professional interests deflect scientists from reason and truth as much as class or political interests? Several writers argue to the contrary. There is no necessary conflict between professional interest and successful pursuit of truth. Kitcher (1990) argues that the optimal division of labor in scientific research may be attained not by "pure", altruistic scientists but by scientists with "grubby" and epistemically "sullied" motives. Similarly, Goldman and Shaked (1991) show that, given certain assumptions about credit-giving practices and experimental choices, there will be little difference between choices of truth-motivated scientists and choices of credit-motivated scientists. Hence, there will be little difference in expected success of moving the community toward truth. Credit-driven interests need not be inimical to truth-promotion.

A further proposal is to expand the "social" beyond politics and interests altogether. The most inclusive sense of the social is simply any relationship among two or more individuals. There is no reason why social epistemology cannot be social in this broad sense. Any interaction among individuals affecting the credal states of some of them might be considered a social-epistemic relationship. So understood, a wide range of communicative interactions would be fit subjects for social epistemology. For example, many knowledge-seeking enterprises are collaborative in nature, including scientific enterprises involving research teams. An interesting task for social epistemology is to identify the types of collaboration that would be optimal in terms of some epistemically relevant measure (Thagard 1997).

Can the "social" be fully captured by inter-individual relationships? Some theorists would argue in the negative, pointing specifically to collective entities such as corporations, committees, juries, and teams. We often attribute mental or mental-like states, including beliefs, to such collective entities (Gilbert 1989; Tuomela 1995; Searle 1995). We might say, for example, that a jury was convinced that the defendant intended such-and-such, or that the jury doubted that a certain alleged conversation really took place. Collective entities are obviously "social" in an important way; and if it is granted that such entities are bearers of beliefs and other doxastic states, shouldn't these collective states be an important target for social epistemology? Precisely this is suggested by Lynn Hankinson Nelson (1993), who goes even further in proposing that the *only* real knowers are communities. For purposes of social epistemology it may not be sufficient that the notion of collective belief be legitimized. What must also be legitimized is the thesis that collective beliefs have epistemic properties, such as "rational" and "irrational", or "justified" and "unjustified". Perhaps this thesis is defensible, however. Frederick Schmitt (1994b) has argued that sense can be made of justification for group beliefs. So the door seems open to this widening of the concept of the "social" for the purposes of social epistemology.

5. The Scope and Methods of Social Epistemology

Epistemology has traditionally focused on the processes or activities of an inquiring and believing agent, an agent who gathers evidence and forms (or withholds) belief based on this evidence. From this point of view, it is natural to restrict epistemology to individual epistemology. But it is also possible to consider the activities of other agents, groups of agents, and institutions whose activities impinge on the quantity and quality of evidence available to a doxastic agent. What truths known by one agent are communicated in some form to additional agents? What falsehoods are similarly disseminated, whether from sincere conviction or deceptive intent? Ascending a level, what norms or practices are in place, or might be put in place, to influence the contents of communications in ways that encourage greater truth acquisition? If epistemology is approached from this perspective, many social dimensions come into view. Additional dimensions are introduced by considering agents and institutions that assist the gathering of evidence by others. Experimentation is the core of scientific evidence gathering, but experimentation requires resources that individual scientific agents cannot marshall on their own. Other scientists and society at large must make choices about which experimental projects to support.

The foregoing questions open up a wide territory for social epistemology to occupy. A great deal of social epistemology has thus far been rather "local" in scope, centering heavily on the domain of science. This is understandable, since science is the most visible, organized, and influential enterprise of knowledge seeking, or knowledge production. But science isn't the only enterprise of knowledge acquisition or knowledge dissemination. People acquire everyday factual information (e.g., the location of the nearest hardware store, the stance that political candidate X has taken on issue Y) by personal observation, and by hearing or reading the reports of others. These routes to knowledge are not strictly scientific. Moreover, most members of the general public never conduct scientific inquiries, but at best rely on first- or second-hand reports about them. Since specialists themselves often disagree in interpreting scientific results, laypersons must choose among them. They must decide what to believe without personally applying scientific methods. Finally, some contexts do not afford opportunities for

(full) application of scientific methods. Jurors have no opportunity to apply all the tools of science to the factual questions before them, although they may, of course, hear expert witnesses who have applied scientific methods to related matters. Thus, while social epistemology has every reason to be concerned with science, it should also target other domains and knowledge-related practices.

For reasons such as these, social epistemology might be divided into topics that examine either global or local practices. Global practices cut across subject-matters and specific institutions. Local practices are tied to particular domains or types of institutions. Styles of rhetoric and interpersonal argumentation, for example, are found in every speech community and speech context. They are examples of global practices; and norms that guide such practices can be highly relevant to knowledge acquisition. Similarly, communication technologies and communicational institutions can massively affect the diffusion of all categories of information or misinformation. The printing press, the computer, and the Internet are particularly salient examples of pertinent communicational technologies. But we should not forget the scholarly library, or print, radio, and television journalism. Finally, systems of public and private education, at all levels, play crucial roles in disseminating knowledge. The form, structure, and policies associated with these communicational entities are highly relevant to the distribution of societal knowledge (Goldman 1999).

Local practices are those associated with particular domains or institutions, such as the adjudicative aspect of the law. Different legal traditions provide different sorts of structures for judging disputes. In the Anglo-American adversarial system, lawyers for the contending parties take the initiative in discovering and presenting evidence for their side, and lay jurors often play the role of fact-finders. In the Continental system, investigations and trials are led by judges rather than lawyers, and the same judges are the principal fact-finders. These systems presumably have the same central aim, viz., rendering correct or accurate judgments about questions under dispute, but one system might be better than the other at achieving that aim..

In all of these domains, social epistemology can ask questions about knowledge-enhancing practices and policies. Which journalistic practices, which Website-designing practices, which rules for intellectual property are best from a knowledge-promoting standpoint (Herman and Chomsky 1988; Fallis 2000; Lessig 1999)? Which system of legal adjudication -- the Continental system or the Anglo-American system -- is optimal in epistemic terms (Langbein 1985; Goldman 1999, chap. 9)? Looking at the details of the Anglo-American system, which specific rules concerning evidence admission or "discovery" of evidence would be epistemically optimal (Damaska 1997; Talbott and Goldman 1998)?

Depending on the specific area of social epistemology one chooses, different methodologies or research paradigms may be appropriate. The choice of methodology will also depend, of course, on whether a descriptive or normative approach is taken. In general, however, it seems likely that methodologies from many different disciplines are needed for a comprehensive treatment of social epistemology. Here is a sampling of methods that have already been applied in some of these terrains.

In the history and sociology of science, case studies and "field" studies (of laboratories) are prevalent.

Rhetorical theory provides another approach to scientific discourse (McCloskey 1985; Fuller 1993). Yet another analytical tool for social epistemology is probability theory. For example, it can be used to prescribe rational changes in an agent's degree of belief, given credibility weights assigned to other agents and their degrees of belief (Lehrer and Wagner 1981). Various techniques of economic analysis, including game theory, can be helpful in social epistemology. These have been utilized in at least two domains: journalism (Cox and Goldman 1994) and the market for speech (Goldman and Cox 1996). Economists William Brock and Steven Durlauf (1999) have created a formal model of theory choice in science, using a neoclassical style of economic analysis. General algebraic techniques are used by Philip Kitcher (1993, chap. 8) to analyze social aspects of science. Clearly, the multiple problems and approaches of social epistemology invite varied research tools borrowed from many disciplines, and initial applications of these tools have been made. It is equally clear, however, that the work of the field lies more in the future than in the past.

Virtue Epistemology

An approach in epistemology that applies the resources of virtue theory to problems in the theory of knowledge. It is argued that by doing so it is possible to give informative accounts of knowledge, evidence, and other important epistemic concepts, while solving a wide range of problems that have plagued other approaches in the theory of knowledge.

Introduction

Virtue epistemology begins with the assumption that epistemology is a normative discipline. The main idea of virtue epistemology is to understand the kind of normativity involved on the model of virtue theories in ethics. This main idea is best understood in terms of a thesis about the direction of analysis. Just as virtue theories in ethics try to understand the normative properties of actions in terms of the normative properties of moral agents, virtue epistemology tries to understand the normative properties of beliefs in terms of the normative properties of cognitive agents. Hence virtue theories in ethics have been described as person-based rather than act-based, and virtue epistemology has been described as person-based rather than belief-based.

For example, non-virtue theories might try to understand the epistemic justification of belief in terms of doing one's epistemic duty, believing according to the evidence, or using a reliable method. In each case

the account of justified belief makes no reference to any normative properties of persons. On the contrary, it would be natural on such views to think of epistemic virtues as dispositions to believe in the ways in question. Virtue epistemology changes this direction of analysis by understanding justified belief in terms of epistemic virtues. For example, Ernest Sosa has argued that justified belief is belief that is grounded in epistemic virtue. Similarly, Linda Zagzebski has argued that knowledge is true belief arising out of acts of intellectual virtue. Of course the next task is to give an informative account of the cognitive virtues involved in such definitions. Depending on how this is done, we get further versions of virtue epistemology.

A number of claims have been made on behalf of virtue epistemology. We have already seen that virtue epistemologists promise to define a range of important epistemic concepts by drawing on the resources of virtue theory. Beyond this, it has been claimed that virtue epistemology can overcome the debate between internalist and externalist conceptions of justification, that it can solve problems pertaining to skepticism, that it can solve Gettier problems, and that it can contribute to a unified theory of value across epistemology and ethics. Recent interest in virtue epistemology began with a paper by Ernest Sosa, where he claimed that a turn to virtue theory would allow a solution to the impass between foundationalist theories of justification and coherentist theories of justification. One way to organize the literature is to begin with Sosa's paper and the development of his own version of virtue epistemology. We may then look at various reactions to Sosa's seminal work. As we shall see, these may be divided into two categories. While some critics have responded with objections to the idea that we should turn to virtue theory in epistemology, another group has responded with objections that Sosa does not go far enough in exploiting the various resources of virtue theory.

Virtue Perspectivism

In "The Raft and the Pyramid: Coherence versus Foundations in the Theory of Knowledge," Sosa suggested that virtue epistemology would allow a solution to the foundationalismÐcoherentism problematic in epistemology. We may think of foundationalism on the metaphor of a pyramid: there is a structure to knowledge involving a nonsymmetrical relation of support among levels, with one level having the special status of a foundation which supports all the rest. In the most plausible versions of foundationalism sensory experience plays an important role in the foundation, providing a ground for observational knowledge from which further knowledge can be inferred higher up in the structure. Coherentism counters this account of knowledge with its metaphor of the raft: knowledge is a structure that floats free of any secure anchor or tie. No part of knowledge is more fundamental than the rest to the overall structure, all of the parts being held together by the ties of logical relations.

According to Sosa, both these accounts of knowledge have fatal flaws. The problem with coherentism is that it cannot account for knowledge at the periphery of a system of beliefs. This is because coherentism makes justification entirely a function of the logical relations among beliefs in the system, but perceptual beliefs have very few logical ties to the remainder. This makes it possible to generate counterexamples to coherentism by means of the following recipe. First, take a perfectly coherent system of beliefs that seems to provide good examples of justified belief and knowledge. Second, replace one perceptual belief

in the system with its negation, while also making any other slight changes that are necessary to preserve coherence. This will have very little effect on the overall coherence of the system, since that is a function only of the logical relations among the system's beliefs. Accordingly, it will turn out to be the case that the new "perceptual belief" is as coherent as the old one, and is therefore, according to coherentism, equally well justified. This result is counter-intuitive, however, since the person's sensory experience has remained the same. Surely she is not justified in believing that she is not standing in front of a tree, for example, if her sensory experience is as if she is standing in front of a tree. Examples like this one suggest that justification is a function of more than the relations among beliefs. Specifically, it is partly a function of one's sensory experience.

This gives the advantage to foundationalism, which allows a role for sensory experience in justified belief and knowledge. But an equally problematic dilemma arises for foundationalism, depending on how one thinks of foundationalism's epistemic principles. Suppose we agree that there is some true epistemic principle relating (i) a relevant sensory experience to (ii) one's justified belief that one is standing in front of a tree. Is this to be understood as a fundmental principle about epistemic justification, or is it to be understood as an instance of some more general principle? If we say the former, then the foundationalist is faced with a seemingly infinite multitude of fundamental principles with no unifying ground. There would be different fundamental principles for visual and auditory experience, for example, as well as possible principles for beings not like us at all, but capable of having their own kind of sensory knowledge. The more attractive alternative is to think of the foundationalist's principles as derived, but then we need an account of some deeper, unifying ground.

This is the context in which Sosa suggests that virtue epistemology will do the trick. Suppose we think of virtues in general as excellences of character. A virtue is a stable and successful disposition: an innate ability or an acquired habit, that allows one to reliably achieve some good. An intellectual virtue will then be a cognitive excellence: an innate ability or acquired habit that allows one to reliably achieve some intellectual good, such as truth in a relevant matter. We may now think of justified belief as belief that is appropriately grounded in one's intellectual virtues, and we may think of knowledge as true belief that is so grounded. By adopting this position, we can see the foundationalist's epistemic principles as instances of this more general account of justified belief and knowledge. The idea is that human beings possess intellectual virtues that involve sensory experience; i.e. stable and reliable dispositions for forming beliefs about the environment on the basis of experiential inputs. Such dispositions involve various sensory modalities such as vision and hearing. Other cognitive beings might be possessed of analogous dispositions, involving kinds of sensory experience unknown to humans. Accordingly, Sosa argues, virtue epistemology provides the unified account that was needed.

The same idea accounts for the truth involved in coherentism as well. Namely, coherence gives rise to justified belief and knowledge precisely because it is the manifestation of intellectual virtue. In our world, and for beings like us, coherence increases reliability, and therefore constitutes a kind of intellectual virtue in its own right. Moreover, coherence of a certain sort allows for reflective knowledge as opposed to mere animal knowledge. According to Sosa, we rise to a different and superior kind of justification and knowledge when we are able to see our beliefs as deriving from intellectual virtues. This perspective on our virtues must itself derive from a second-order intellectual virtue, one that allows us to

reliably monitor and adjust our first-level cognitive dispositions.

Notice that the above ideas involve the direction of analysis thesis discussed above. Traditional foundationalism and coherentism try to account for justified belief and knowledge solely by reference to the properties of beliefs; i.e. their logical relations (coherentism) or their logical relations plus their relations to sensory experiences (traditional foundationalism). Sosa's version of virtue epistemology accounts for various kinds of justified belief and knowledge by first defining the notion of an intellectual virtue, and then by defining various normative properties of beliefs in terms of this more fundamental property of persons.

Responses to Sosa have focussed on various objections to the position outlined above, including the general claim that a turn to virtue theory would be a fruitful approach in epistemology. A second group of critics has endorsed Sosa's call for a turn to virtue theory in epistemology, but have argued that he does not go far enough in exploiting the various resources that virtue theory offers.

Responsibilism I

One early response to Sosa along this second line is by Lorraine Code, who argues for the centrality of epistemic responsibility in epistemology. Code agrees with Sosa's direction of analysis thesis, endorsing the idea that primary justification is best understood as attaching to stable dispositions to act in certain ways, while secondary justification accrues to particular acts because of their sources in virtues. This approach, she argues, appropriately focuses epistemology on persons, their cognitive activities, and their membership in a community defined by social practices of enquiry. The individual knower is now recognized as part of a community, with all the moral and intellectual obligations that this entails. However, Code argues, redirecting epistemology in this way gives the notion of epistemic responsibility central importance. Characterizing Sosa's position as a version of reliabilism, she argues that her own "responsibilism" constitutes a more adequate development of Sosa's initial insights. This is because, in part, the notion of responsibility emphasizes the active nature of the knower, as well as the element of choice involved in the knower's activity. Whereas a merely passive recorder of experience can be described as reliable, only an active, creative agent can be assessed as responsible or irresponsible, as having fulfilled her obligations to fellow enquirers, etc. According to Code, then, Sosa is correct to call for a focus on intellectual virtues in epistemology, with the focus on agency and community that this implies. But the natural way to develop this insight is to understand the intellectual virtues in terms of epistemic responsibility. Code goes so far as to say that epistemic responsibility is the central intellectual virtue, from which all other intellectual virtues radiate.

Another interesting feature of Code's view concerns some theses about the prospects for epistemology. Placing emphasis on virtue and responsibility, she argues, has consequences for both how epistemology should be conducted and the kind of epistemological insights we should hope for. First, emphasizing the contextual and social dimensions of knowledge introduces complexity into theorizing, and in such a way that shows the usual examples and counter-examples in epistemology to be inadequate. Such examples under-describe the relevant epistemic circumstances, leaving out such relevant considerations as history,

social role, conflicting obligations, etc. To show how such factors are indeed relevant, it is necessary to replace these thin examples with thickly descriptive narrative. Only stories that tie a whole life together provide an adequate context for epistemic evaluations, precisely because the factors that govern such evaluations are that rich and complex.

Moreover, Code argues, thick narratives are essential for understanding the very nature of intellectual virtue. Echoing a point by Alasdair MacIntyre, Code argues that an adequate understanding of what it is to be virtuous requires placing virtuous selves in the unity of a narrative. A consequence of this is that we should not expect to describe tidy conditions for justification and knowledge. The relevant criteria for epistemic evaluation are too varied and complex for that, and so any simple theory of knowledge will distort rather than adequately capture those criteria. This does not mean, however, that insight into the nature and conditions of justification and knowledge is impossible. Rather, such insight is to be gained by narrative history rather than theory construction of the traditional sort.

Responsibilism II

Following Sosa, Code tends to think of intellectual virtues as broad cognitive faculties or abilities pertaining to some subject matter. In this respect both authors are following Aristotle, who names intuition, science, wisdom and prudence as intellectual virtues. For example, for Aristotle intuition is the ability to know first principles, while science is the ability to deduce further truths from these. James Montmarquet has developed the notion of an intellectual virtue in a different direction, conceiving them on the model of Aristotle's moral virtues. Rather than thinking of intellectual virtues as cognitive faculties or abilities, he conceives them as personality traits, such as impartiality and intellectual courage. In sum, intellectual virtues are personality traits that a person who desires the truth would want to have.

Like Code, Montmarquet criticizes Sosa's position for not sufficiently exploiting the resources of virtue theory in ethics. Also like Code, he criticizes Sosa's emphasis on the reliability of intellectual virtues, and wants to replace this with an emphasis on responsibility and other concepts related to agency. According to Montmarquet, it is a mistake to characterize the intellectual virtues as reliable in the sense of truth-conducive. This is because we can imagine possible worlds, such as Descartes' demon world, where the beliefs of epistemically virtuous people are almost entirely false. Alternatively, we can imagine worlds where the intellectually lazy and careless have mostly true beliefs. Suppose we were to somehow discover that ours was such a world. Would we then revise our opinions about which traits count as intellectual virtues and which as vices? Montmarquet argues that we would not. Traits like intellectual courage and carefulness are virtues even if we are unfortunate enough to be the victims of a Cartesian deceiver, and traits like laziness and carelessness are vices even if, contrary to appearances, they turn out to be reliable. But then reliability cannot be a distinctive mark of the intellectual virtues.

A different approach is to characterize the virtues in terms of a desire for truth. According to Montmarquet, the central intellectual virtue is epistemic conscientiousness. To be conscientious in this sense is to be motivated to arrive at truth and to avoid error; it is to have an appropriate desire for the truth. Here there is a parallel with moral conscientiousness, where a morally conscientious person is

someone who tries her best to do what is right. This notion of epistemic conscientiousness is closely related to that of epistemic responsibility, or perhaps identical with it. Hence with Code, Montmarquet makes epistemic responsibility rather than reliability central to his understanding of intellectual virtue.

According to Montmarquet, then, epistemic conscientiousness is the central intellectual virtue. However, intellectual virtue cannot be understood solely in terms of a desire for truth, since one's desire for truth must be appropriately regulated. We must therefore countenance additional regulative virtues, which constitute ways of being conscientious. Montmarquet classifies these under three main categories. "Virtues of impartiality" include such personality traits as openness to the ideas of others, willingness to exchange ideas, and a lively sense of one's own fallibility. "Virtues of intellectual sobriety" oppose the excitement and rashness of the overly enthusiastic. Finally, "virtues of intellectual courage" include a willingness to conceive and examine alternatives to popular ideas, perseverance in the face of opposition from others, and determination to see an inquiry through to the end.

Montmarquet suggests that we can use the above account of intellectual virtue to define an important sense of subjective justification. Specifically,

> *S is subjectively justified in believing p insofar as S is epistemically virtuous in believing p.*

This is not the kind of justification that turns true belief into knowledge. This is because Gettier cases show that a person can be justified in believing something in this sense, but still lack the kind of objective relation to the truth required for knowledge. Nevertheless, Montmarquet argues, the above sense of justification is important regarding a different issue. Namely, Montmarquet is concerned with the problem of morally evaluating actions. More specifically, he is concerned with the problem of blaming persons for actions which, from their own point of view, are morally justified. Often enough, the morally outrageous actions of tyrants, racists and terrorists seem perfectly reasonable, even necessary, in the context of their distorted belief system. In order to find the actions blameworthy in such cases, it would seem that we have to find the beliefs blameworthy as well. In other words, we need some account of "doxastic responsibility," or the kind of responsibility for belief that can ground responsibility for actions. The above account of subjective justification, Montmarquet argues, provides what we are looking for. Precisely because it understands justification in terms of intellectually virtuous behavior, the account allows a plausible sense in which justified (and unjustified) belief is under a person's control. This, in turn, makes the relevant beliefs to be appropriate objects of blame and praise.

One objection to this sort of view is that judgements of responsibility are inappropriate in the cognitive domain. The idea is that judgements of praise and blame presuppose voluntary control, and that we lack such control over our beliefs. Montmarquet responds to this objection by distinguishing between a weak and a strong sense of voluntary control. Roughly, a belief is voluntary in the weak sense if it is formed in circumstances which do not interfere with virtuous belief formation. This kind of voluntariness amounts to freedom from interference or coercion. A belief is voluntary in the strong sense (again roughly) if it is subject to one's will. Montmarquet's strategy is to concede that responsibility requires weak voluntary control, but to argue that we often have this kind of control over our beliefs. Second, he concedes that we

do not typically have strong voluntary control over our beliefs, but argues that responsibility does not require it.

The analogy with action is instructive. One can be appropriately blamed for negligent actions and inadvertent actions, and even in cases where there is no actual choice regarding the action in question. In cases of action as well as belief, strong voluntary control is not necessary for responsibility. On the other hand, praise or blame would be inappropriate in cases where action is coerced. However, many of our beliefs satisfy the relevant "no coercion condition," and so are weakly voluntary in that sense.

A Mixed Theory

Greco has argued that intellectual virtue is closely tied to epistemic responsibility, but without rejecting Sosa's position that the virtues are reliable, or truth-conducive. The main idea is that an adequate account of knowledge ought to contain both a responsibility condition and a reliability condition. Moreover, a virtue account can explain how the two are tied together. In cases of knowledge, objective reliability is grounded in epistemically responsible action.

The way this works is as follows. First, we can give an account of subjective justification in terms of epistemic responsibility:

> *S is subjectively justified in believing p if and only if S's believing p is epistemically responsible.*

The notion of responsibility, in turn, can be understood in terms of the dispositions S manifests when S is thinking conscientiously, or is motivated to believe the truth. Such motivation need not be self-conscious, or even univocal. Rather, it is meant to specify the kind of default position that people are usually in, and to oppose this to the alternative motivations involved in such things as wishful thinking, pig-headedness and attention grabbing. This suggests the following account of subjective justification.

> *S is subjectively justified in believing p if and only if S's believing p results from the dispositions that S manifests when S is motivated to believe the truth.*

Finally, this kind of subjective justification gives rise to objective reliability when things go well:

> *S knows p only in cases where (a) S is subjectively justified in believing p, and (b) as a result of this S is objectively reliable in believing p.*

One feature of the above account is that it understands both justified belief and knowledge in terms of the dispositions that make up S's cognitive character. In other words, it makes the notion of virtuous character primary, and then gives accounts of justified belief and knowledge in terms of this. Accordingly, we can define virtuous character in terms of proper motivation and reliability as these

notions are understood above, and then given the following (partial) account of knowledge.

> *S knows p only in cases where S's believing p results from a virtuous cognitive character.*

A Social/Genetic Approach

Jonathan Kvanvig has argued for a more radical departure from traditional epistemological concerns. According to Kvanvig, traditional epistemology is dominated by an "individualistic" and "synchronic" conception of knowledge. Accordingly, one of the most important tasks from the traditional perspective is to specify the conditions under which an individual S knows a proposition p at a particular time t. Kvanvig argues that this perspective should be abandoned in favor of a new social/genetic approach. Whereas the traditional perspective focuses on questions about justified belief and knowledge of individuals at particular times, a new genetic epistemology would focus on the cognitive life of the mind as it develops within a social context. From the new perspective, questions concerning individuals are replaced with questions concerning the group, and questions concerning knowledge at a particular time are abandoned for questions about cognitive development and learning. Kvanvig argues that there are at least two ways in which the virtues would be central within the new perspective. First, the virtues are essential to understanding the cognitive life of the mind, particularly the development and learning which takes place over time through mimicking and imitation of virtuous agents. Second, in a social/genetic approach the virtues would play a central role in the characterization of cognitive ideals. For example, what makes a certain structuring of information superior, Kvanvig argues, is that it is the kind of structuring that a person of intellectual virtue would come to possess in the appropriate circumstances.

A Neo-Aristotelian Theory

We have seen that both Code and Montmarquet argue for a closer affinity between virtue epistemology and Aristotle's theory of the moral virtues. For example, Montmarquet thinks of the intellectual virtues as epistemically relevant personality traits, and both authors emphasize the close connection between virtue, agency and responsibility. The most detailed and systematic presentation of a neo-Aristotelian view, however, is due to Linda Zagzebski. She argues for a unified account of the intellectual and moral virtues, modeled on Aristotle's account of the moral virtues. Her view should be characterize as "neo-Aristotelian" rather than "Aristotelian," because Aristotle did not hold that the moral and intellectual virtues are unified in this way.

First, Zagzebski endorses the "direction of analysis thesis" characterized above. The distinctive feature of a virtue theory in ethics, she argues, is that it analyzes right action in terms of virtuous character, rather than the other way around.

> "By a pure virtue theory I mean a theory that makes the concept of a right act derivative from the concept of a virtue or some inner state of a person that is a component of virtue. This is a point both about conceptual priority and about moral ontology. In a pure virtue

> theory the concept of a right act is defined in terms of the concept of a virtue or a component of virtue such as motivation. Furthermore, the property of rightness is something that emerges from the inner traits of persons." (Zagzebski 1996, p. 79)

An epistemology modeled on this kind of ethical theory, then, would analyze justification and other important normative properties of belief in terms of intellectual virtue. Moreover, Zagzebski argues, we can give a unified account of moral and intellectual virtue based on an Aristotelian model of the moral virtues. In fact, she argues, intellectual virtues are best understood as a subset of the moral virtues.

According to Aristotle, the moral virtues are acquired traits of character that involve both a motivational component and a reliable success component. For example, moral courage is the virtue according to which a person is characteristically motivated to risk danger when something of value is at stake, and is reliably successful at doing so. Likewise, we can understand benevolence as the virtue according to which a person is motivated to bring about the well-being of others, and is reliably successful at doing so. Intellectual virtues have an analogous structure, Zagzebski argues. Just as all moral virtues can be understood in terms of a general motivation for the good, all intellectual virtues may be understood in terms of a general motivation for knowledge and other kinds of high-quality cognitive contact with reality. Individual intellectual virtues can then be specified in terms of more specific motivations that are related to the general motivation for knowledge. For example, open-mindedness is the virtue according to which a person is motivated to be receptive to new ideas, and is reliably successful at achieving the end of this motivation. Intellectual courage is the virtue according to which a person is motivated to be perservering in her own ideas, and is reliably successful at doing this.

Understanding the intellectual virtues this way, we can go on to define a number of important deontic properties of belief. Each definition, Zagzebski argues, is parallel to a definition for an analogous deontic property of actions.

> *A justified belief is what a person who is motivated by intellectual virtue, and who has the understanding of his cognitive situation a virtuous person would have, might believe in like circumstances.*
>
> *An unjustified belief is what a person who is motivated by intellectual virtue, and who has the understanding of his cognitive situation a virtuous person would have, would not believe in like circumstances.*
>
> *A belief of epistemic duty is what a person who is motivated by intellectual virtue, and who has the understanding of his cognitive situation a virtuous person would have, would believe in like circumstances.*

As with the moral virtues, it is possible for a conflict among the intellectual virtues to arise. Thus the intellectually courageous thing to do might conflict with the intellectually humble thing to do. This problem is solved by introducing the mediating virtue of phronesis, or practical wisdom. The practically

wise person is able to weigh the demands of all the relevant virtues is a given situation, so as to direct her cognitive activity appropriately. Accordingly we get the following definitions of "all things considered" justification.

> *A justified belief, all things considered, is what a person with phronesis might believe in like circumstances.*

> *An unjustified belief, all things considered, is what a person with phronesis would not believe in like circumstances.*

> *A belief is a duty, all things considered, just in case it is what a person with phronesis would believe in like circumstances.*

Finally, Zagzebski argues that we can give a definition of knowledge by first defining an "act of intellectual virtue".

> *An act of intellectual virtue A is an act that arises from the motivational component of A, is something a person with virtue A would (probably) do in the circumstances, is successful in achieving the end of the A motivation, and is such that the agent acquires a true belief (cognitive contact with reality) through these features of the act.*

We may then define knowledge as follows:

> *Knowledge is a state of true belief (cognitive contact with reality) arising out of acts of intellectual virtue.*

Since the truth condition is redundant, we may say alternatively:

> *Knowledge is a state of belief arising out of acts of intellectual virtue.*

The Scope of Virtue Epistemology

We have seen that a number of authors endorse a turn to virtue theory in epistemology. Moreover, these same authors have variously invoked Aristotle, Aquinas, Reid, Dewey and Peirce as early adherents of a virtue approach. This gives rise to the question of the scope of virtue epistemology. In fact, there has been some controversy about this in the contemporary literature.

Kvanvig has argued that early versions of reliabilism, including those of David Armstrong, Alvin Goldman and Robert Nozick, are best understood as versions of virtue epistemology. Although these views make explicit reference to reliable processes and reliable methods, Kvanvig argues that they are most charitably understood as concerned with reliable cognitive character. As such, they are implicit

versions of virtue epistemology. Sosa has made similar arguments regarding Alvin Plantinga's view, and Greco has argued that any view that makes justification or knowledge a function of agent reliability thereby counts as a version of virtue epistemology.

Against this, Code and Zagzebski argue that reliabilist views fail to exploit the most valuable resources of virtue theory. Moreover, Plantinga has explicitly rejected the virtue label, arguing that the foundational concept for his view is proper function rather than intellectual virtue. These disputes are not merely semantic. Rather, they reflect disagreements over what is truly of value in virtue theory. Put another way, they are disputes about what aspects of virtue theory, if any, are doing valuable work in various accounts of justification, knowledge and other important epistemic notions.

However such disputes are resolved, we have seen that there is one way of characterizing virtue epistemology so that a broad range of views count as versions of the position. Specifically, we may understand virtue epistemology primarily as a thesis about the direction of analysis: that the normative properties of beliefs are to be defined in terms of the normative properties of agents, rather than the other way around. If we understand the position this way, then a broad range of views will count as versions of virtue epistemology. We may then understand further disputes among them as concerning the nature of the intellectual virtues. In other words, different versions of virtue epistemology disagree over what kind of agent character is essentially involved in justification, knowledge and other important epistemic notions.

Foundationalist Theories of Epistemic Justification

Foundationalism is a view about the structure of justification or knowledge. The foundationalist's thesis in short is that all knowledge and justified belief rest ultimately on a foundation of noninferential knowledge or justified belief.

A little reflection suggests that the vast majority of the propositions we know or justifiably believe have that status only because we know or justifiably believe other different propositions. So, for example, I know or justifiably believe that Caesar was an assassinated Roman leader, but only because I know or justifiably believe (among other things) that various historical texts describe the event. Arguably, my knowledge (justified belief) about Caesar's death also depends on my knowing (justifiably believing) that the texts in question are reliable guides to the past. Foundationalists want to contrast my inferential knowledge (justified belief) about Caesar with a kind of knowledge (justified belief) that doesn't involve the having of other knowledge (justified belief). There is no standard terminology for what we shall henceforth refer to as noninferential knowledge or justification.[1]

For convenience, in what follows we will concentrate on foundationalism about justification. Everything said about justified belief will apply mutatis mutandis to foundationalist views about knowledge. On the "classical" analysis of knowledge, the core of the concept of knowledge *is* justified true belief and the foundational structure of knowledge simply derives from the foundational structure or justification.

It is surely fair to suggest that for literally thousands of years the foundationalist's thesis was taken to be almost trivially true. When an argument was implicitly or explicitly offered for the view it was most often the now famous regress argument. It is important, however, to distinguish two quite different regress arguments for foundationalism--the epistemic regress argument and the conceptual regress argument.

---

1. The Regress Arguments for Foundationalism

Suppose I claim to be justified in believing that Fred will die shortly and offer as my evidence that Fred has an untreatable and serious form of cancer. Concerned, you ask me how I discovered that Fred has the cancer and I respond that it is just a hunch on my part. As soon as you discover that I have no reason at all to suppose that Fred has the cancer, you will immediately conclude that my whimsical belief about Fred's condition gives me no justification for believing that Fred will soon die. Generalizing, one might suggest the following principle:

> To be justified in believing P on the basis of E one must be justified in believing E.

Now consider another example. Suppose I claim to be justified in believing that Fred will die shortly and offer as my justification that a certain line across his palm (his infamous "lifeline") is short. Rightly skeptical, you wonder this time what reason I have for believing that palm lines have anything whatsoever to do with length of life. As soon as you become satisfied that I have no justification for supposing that there is any kind of probabilistic connection between the character of this line and Fred's life you will again reject my claim to have a justified belief about Fred's impending demise. That suggests that we might expand our Principle of Inferential Justification (PIJ) to include a second clause:

> **Principle of Inferential Justification:**
> To be justified in believing P on the basis of E one must not only be (1) justified in believing E, but also (2) justified in believing that E makes probable P.

With PIJ one can present a relatively straightforward *epistemic* regress argument for foundationalism. If all justification were inferential then for someone S to be justified in believing some proposition P, S must be in a position to legitimately infer it from some other proposition E1. But E1 could justify S in believing P only if S were justified in believing E1, and if all justification were inferential the only way for S to do that would be to infer it from some other proposition justifiably believed, E2, a proposition which in turn would have to be inferred from some other proposition E3 which is justifiably believed, and so on, ad infinitum. But finite beings cannot complete an infinitely long chain of reasoning and so if all justification were inferential no-one would be justified in believing anything at all to any extent whatsoever. This most radical of all skepticisms is absurd (it entails that one couldn't even be justified in believing it) and so there must be a kind of justification which is not inferential, i.e. there must be noninferentially justified beliefs which terminate regresses of justification.

If we accept the more controversial second clause of PIJ, the looming regresses proliferate. Not only must S above be justified in believing E1, S must also be justified in believing that E1 makes likely P, a proposition he would have to infer (if there are no foundations) from some other proposition F1, which he would have to infer from F2, which he would have to infer from F3, and so on ad infinitum. But S would also need to be justified in believing that F1 does in fact make likely that E1 makes likely P, a proposition he would need to infer from some other proposition G1, which he would need to infer from some other proposition G2... . And he would need to infer that G1 does indeed make likely that F1 makes likely that E1 makes likely P... . Without noninferentially justified beliefs, it would seem that we would need to complete an infinite number of infinitely long chains of reasoning in order to be justified in believing anything!

The above argument relies on the unacceptability of a vicious *epistemic* regress. But one might also argue, more fundamentally, that without a *concept* of noninferential justification, one faces a vicious *conceptual* regress. What precisely is our *understanding* of inferential justification? What makes PIJ true? It is at least tempting to answer that PIJ is an analytic truth. Part of what it *means* to claim that someone has inferential justification for believing some proposition P is that his justification consists in his ability to infer P from some other proposition E1 that is justifiably believed. But if anything like this is a plausible analysis of the concept of inferential justification, we face a potential vicious conceptual regress. The analysis of inferential justification presupposes an understanding of justified belief. We need to introduce a concept of noninferential justification in terms of which we can then recursively define inferential justification.

Consider an analogy. Suppose a philosopher introduces the notion of instrumental goodness (something's being good as a means). That philosopher offers the following crude analysis of what it is for something to be instrumentally good. X is instrumentally good when X leads to something Y which is good. Even if we were to accept this analysis of instrumental goodness, it is clear that we haven't yet located the conceptual source of goodness. Our analysis of instrumental goodness presupposes an understanding of what it is for something to be good. In short we can't understand what it is for something to be instrumentally good until we have some prior (and more fundamental) understanding of what it is for something to be intrinsically good. The conceptual regress argument for foundationalism puts forth the thesis that inferential justification stands to noninferential justification as instrumental goodness stands to intrinsic goodness.

2. The Analysis of Noninferential Justification

If foundationalists are united in their conviction that there must be a kind of justification that does not depend on the having of other justified beliefs, they nevertheless disagree radically among themselves as to how to understand noninferential justification. In the latter part of this century, the rise of externalist epistemologies has generated even more fundamentally different versions of foundationalism. It will not be possible to survey all of the strikingly different analyses that have been offered of noninferential justification. In what follows we will examine a few of the more prominent versions of classical and contemporary externalist foundationalisms.

2.1 Noninferential Justification as Infallible Belief

Descartes is often taken to be the paradigm of a classical foundationalist. Determined to build knowledge on appropriate and secure foundations he seemed to want to identify foundational knowledge with infallible belief. Implicitly or explicitly others seemed to follow his lead by restricting noninferentially justified beliefs to beliefs that cannot be mistaken. Thus, for example, when Price (1950) introduced the notion of sense data, knowledge of which would be included in his foundations of empirical knowledge, he contrasted sense data and their nonrelational properties with other sorts of things about which one could be mistaken, implying again that the way to find the correct foundations of knowledge is to eliminate from one's beliefs system all those beliefs that could be false. Following Lehrer (1974, p. 81)) we might formulate the following definition of infallible belief:

> S's belief that P at t is infallible if S's believing P at t entails[2] that P is true.

As Lehrer and others have pointed, it is far from clear that this concept of infallible belief has much relevance to an attempt to understand the epistemic concept of noninferential justification. The first and most striking problem involves necessary truths. Every necessary truth is entailed by every proposition, and thus if I happen to believe a necessary truth, P, that I believe P will entail that P is true. Thus by the above definition my belief that P will be infallible whenever P is a necessary truth even if P is far too complicated for me to prove and I believe it solely on a whim.

Furthermore, a foundation of knowledge and justified belief restricted to infallible beliefs (as defined above) would arguably be far too flimsy to support any sort of substantial epistemic edifice. There are a few contingent propositions that are trivially entailed by the fact that they are believed. My belief that I exist entails that I exist, that I have at least one belief, that someone has beliefs, that experience (broadly construed) exists, etc. But once we get past these sorts of "self-referential" propositions, propositions whose very subject matter encompasses the fact that they are believed, it is hard to come up with uncontroversial examples of infallible beliefs. Ayer (1956, p. 19) argues that as long as the belief that P is one state of affairs and P's being the case is an entirely different state of affairs (not including as a constituent the former) there can be no logical absurdity in the supposition that the former could occur without the latter.

Although it doesn't add much to the logical force of the argument, one might employ our hunches about how the brain might work to rhetorically bolster the argument. Consider a standard candidate for an infallible empirical belief, my belief that I am in pain now. It is surely possible that the region of the brain causally responsible for producing the belief that I am in pain is entirely different from the region of the brain causally responsible for producing the pain. There may be a causal connection between the occurrence of the "pain" brain event and the occurrence of the "belief" brain event, or vice versa, but even if the causal connection holds it will be a contingent fact that it does. It hardly seems that the neurophysiologist could discover these (or any other) causal connections purely a priori. But if the brain state responsible for my belief that I am in pain is wholly different from the brain state responsible for

the pain, and if the connections between them are merely nomological, then it is in principle possible to produce the one without the other. The belief will not entail the truth of what is believed.

2.2 Noninferential Justification as Infallible Justification

It may be that classical foundationalists start off on the wrong foot if they seek foundations in logical relations between the mere fact that someone believes some proposition and the proposition's being true. Noninferential justification is, after all, a kind of justification and if the impossibility of error is essential to noninferential justification, it may be more plausible to locate the source of infallibility in a special kind of justification available in support of a belief. Let us say that S's belief is infallibly justified at t when S's justification for believing P at t relevantly entails the truth of P. We need to qualify the entailment as relevant to circumvent the problems discussed earlier. Whenever I have any justification at all for believing a proposition that turns out to be necessarily true, that justification will entail the necessary truth. But we do not want just any sort of justification to yield infallibly justified belief even if the object of that belief is a necessary truth.

What is the difference between relevant and irrelevant entailment? This is a question notoriously difficult to answer, but intuitively it should have something to do with the fact that would make true the proposition entailed and the fact that would make true the proposition that entails it. More specifically, we could say that P relevantly entails Q only if the fact that would make P true is at least a constituent of the fact that would make Q true. This suggestion can be considered at best only preliminary since we will obviously need a more detailed account of facts and their constituents. That I have grey hair entails that someone has grey hair, but is my having grey hair a constituent of the fact that is someone's having grey hair? There is certainly a sense in which it is something one can point to in answer to the question "What makes it true that someone has grey hair?" One cannot appropriately point to my having grey hair as something that makes it true that two plus two equals four.

Consider again my belief that I'm in pain (when I am). If such a belief is noninferentially justified, in what does the justification for that belief consist. Surely not in the mere fact that the proposition is believed. What is it that distinguishes this belief from my belief about Caesar's assassination. Some foundationalists want to locate the noninferential justification in the truth-maker for the proposition believed. What justifies me in believing that I'm in pain when I am is the mere fact that I'm in pain. But again, what is it about my being in pain as opposed to Caesar's being assassinated which makes it appropriate to claim that my being in pain justifies me in believing that I'm in pain while Caesar's having been assassinated doesn't justify me in believing that Caesar was assassinated.

It is tempting to think that the foundationalist is better off appealing to some special *relation* that I have to my pain which makes it unnecessary to look to other beliefs in order to justify my belief that I'm in pain. It is the fact that I have a kind of *access* to my pain that no-one else has that makes my belief noninferentially justified while others must rely on inference in order to discover that I am in this state. This takes us to another classical version of foundationalism, the acquaintance theory. Perhaps the best known proponent of an acquaintance theory is Bertrand Russell,[3] but it takes little imagination to read

the view into most of the British empiricists. Roughly the view is that what justifies S in believing that he is in pain when he does is the fact that S is directly and immediately acquainted with his pain in a way in which he is not directly and immediately acquainted with any contingent facts about Caesar, the physical world, the future, and so on. On a correspondence conception of truth, one might add that to be fully justified in believing a proposition to be true one must be acquainted not only with the fact that makes the proposition true but the relation of correspondence that holds between the proposition and the fact.

In one of the most influential arguments against foundationalism, Wilfrid Sellars (1963, 131-32) argued that the idea of the given in traditional epistemology contains irreconcilable tensions. On the one hand, to ensure that something's being given does not involve any other beliefs, proponents of the view want the given to be untainted by the application of *concepts*. On the other hand, the whole doctrine of the given is designed to end the regress of justification, to give us secure foundations for the rest of what we justifiably infer from the given. But to make sense of making inferences from the given the given must have a truth value. The kind of thing that has a truth value involves the application of concepts or thought, a capacity not possessed (we may presume) by at least lower-order animals.

If there is a solution to the dilemma presented by Sellars (and others) it is to emphasize that acquaintance is not by itself an epistemic relation. Acquaintance is a relation that other animals might bear to properties and even facts, but it also probably does not give these animals any kind of justification for *believing* anything, precisely because these other animals probably do not have beliefs. Without thought or propositions entertained there is no truth, and without a bearer of truth value in the picture there is nothing to be justified or unjustified. The acquaintance theorist can argue that one has a noninferentially justified belief that P only when one has the thought that P and one is acquainted with both the fact that P, the thought that P, and the relation of correspondence holding between the thought that P and the fact that P. On such a view no single act of acquaintance yields knowledge or justified belief, but when one has the relevant thought (entertains the relevant proposition), the three acts together constitute noninferential justification. When everything that is constitutive of a thought or a proposition's being true is immediately before consciousness, there is nothing more that one could want or need to justify a belief. The state that constitutes noninferential justification is a state that contains as constituents both the bearer of truth-value and the truth-maker.[4]

When an acquaintance with the fact that P is part of what constitutes my noninferential justification for believing P, there is a trivial sense in which my noninferential justification is infallible. I can't be directly acquainted with the fact that P while I believe P falsely. There is, however, nothing to prevent an acquaintance theorist from allowing that one can be noninferentially justified in believing P by virtue of being directly acquainted with a fact very similar to, but ultimately different from the fact that P (the fact that makes P true). Such an acquaintance theory could allow for the possibility of noninferentially justified but false belief that P.[5]

3. Objections to Classical Foundationalism

Once the received view, classical foundationalism has come under considerable attack in the last few

decades. We have already considered the very influential objection raised by Sellars to the idea of there being a "given" element in experience. It is crucial that the foundationalist discover a kind of *truth* that can be known without inference. But there can be no bearers of truth value without judgment and judgment involves the application of concepts. But to apply a concept is to make a judgment about class membership, and to make a judgment about class membership always involves relating the thing about which the judgment is made to other paradigm members of the class. These judgments of relevant similarity will minimally involve beliefs about the past, and thus be inferential in character (assuming that we can have no "direct" access to facts about the past). A reply to this objection would take us far afield indeed. Perhaps it will suffice to observe that the objection relies on a number of highly controversial claims about the nature of judgment, most of which the classical foundationalist should and would reject.

The direct acquaintance theorist does presuppose the intelligibility of a world that has "structure" independent of any structure imposed by the mind. Without nonlinguistic facts that are independent of the thoughts and judgments that represent them, one could not make sense of a relation of acquaintance between a person and a fact, a relation that grounds noninferential justification. More radical contemporary rejections of foundationalism may well involve dissastification with the foundationalist's implicit commitment to a strong realistic correspondence conception of truth. Since Kant there has always been a strong undercurrent of anti-realism running through philosophy. The metaphor is that of the mind imposing structure on reality. And there is an intuitively plausible sense in which one can genuinely wonder whether it makes sense to ask about the number of colors that are exemplified in the world independently of some framework provided by color *concepts*. But despite the periodic popularity of extreme anti-realism, it is surely absurd to suppose that it is even in principle possible for a mind to force a structure on a literally unstructured world. There are indefinitely many ways to sort the books in a library and some are just as useful as others, but there would be no way to begin sorting books were books undifferentiated. If a rejection of foundationalism relies on an extreme form of anti-realism so much the worse for the anti-foundationalist.

Just as some anti-foundationalists reject the conception of truth underlying classical foundationalist accounts of noninferential justification, so others profess to be bewildered by some of the fundamental concepts employed in defining noninferential justification. The acquaintance theorist tends to have relatively little to say by way of analyzing what direct acquaintance is. To be sure one can try to give someone a feel for what one is talking about by contrasting one's awareness of pain with the temporary distraction caused by an engrossing conversation. It is tempting to suppose that for a short time the pain was still present but the person with the pain was no longer aware of the fact that the pain exists. This awareness, the acquaintance theorist will argue, is obviously something over and above mere belief in the existence of the pain, as one can believe that one is in a mental state (say a subconscious mental state) without being aware of that state. Like most theories foundationalism will, however, ultimately rest its intelligibility on an appeal to a sui generis concept that defies further analysis. Just as one needs to end epistemic regresses with foundational justification, the foundationalist will argue, so one needs to end conceptual regresses with concepts one grasps without further definition.

Laurence BonJour (1985) raised another highly influential objection to all forms of classical

foundationalism (an objection raised before he joined the ranks of foundationalists). The objection presupposed a strong form of what we might call access internalism. Put very superficially the access internalist argues that a feature of a belief or epistemic situation that makes a belief noninferentially justified must be a feature to which we have actual or potential access. Moreover, we must have access to the fact that the feature in question is probabilistically related to the truth of what we believe. So suppose some foundationalist offers an account of noninferential justification according to which a belief is noninferentially justified if it has some characteristic X. BonJour then argues that the mere fact that the belief has X could not, even in principle, justify the believer in holding the belief. The believer would also need access to (justified belief that!) the belief in question has X and that beliefs of this sort (X beliefs) are likely to be true. At least one of these propositions could only be known through inference, and thus the putative noninferential justification is destroyed.

BonJour presented the objection on the way to developing a coherence theory of empirical justification. But it ultimately became obvious that the objection to foundationalism, if good, was too strong. Given the structure of the argument it should become evident that the coherence theory (and any other theory) would be equally vulnerable to the argument. Just replace "X" with some complicated description of beliefs cohering with each other. That might suggest to the classical foundationalist that strong access internalism is a view to be avoided.

The Principle of Inferential Justification used to generate the regress argument for foundationalism is itself controversial. It is important to note that either clause of the principle can be used by itself to generate the allegedly vicious epistemic and conceptual regress for the philosopher who rejects foundations. It is the two clauses combined that are supposed to present the anti-foundationalist with an infinite number of vicious regresses. A number of philosophers (among them foundationalists) would argue that the second clause of PIJ confuses levels of epistemic questions. It is far too strong to require someone to have a justified belief in a probabilistic connection between available evidence and the conclusion reached on the basis of that evidence. Such a requirement is at best plausible for having second-level justification for believing that one has an inferentially justified belief. In responding to a challenge presented to one's having an inferentially justified belief in P on the basis of E one might find oneself searching for justification to support the claim that E makes probable P, but that is only because in the context of the challenge one is trying to make good (i.e. justify) the claim that one has a justified belief. A similar claim might be made with respect to clause 1) of the principle, although it is more difficult to generate the supporting intuition.

In any event, the careful foundationalist is certainly not *confused* about level-distinctions. The foundationalist who supports PIJ is claiming that a necessary condition for someone's having an inferentially justified belief in P based on E is that the person have both a justified belief in E and a justified belief in the proposition that E makes P probable. It is simply not enough that E is true or that E does in fact make probable P. Our original examples used to support PIJ would seem to reinforce that conclusion. Even if there happened to be some bizarre connection between palm lines and length of life, for example, the person who has no reason to believe that such a connection exists has no justification for conclusions reached about length of life based on this anatomical feature of people.

There are, of course, other responses to the charge of vicious regress facing anti-foundationalists. The coherence theorist rejects the foundationalist's presupposition that justification is linear. Each belief is justified by virtue of its coherence with the rest of what one believes but one avoids the appearance of vicious circularity by insisting that one needn't *first* have justification for believing the other propositions in one's belief system. The coherence theorist's response to the argument for foundationalism is, of course, only as plausible as the coherence theory of justification (See coherence theories of justification).

Peter Klein (1998) may be the lone supporter of a view he calls infinitism. The infinitist accepts the need to be *able* to supply non-circular justification for believing what we do, but argues that given the complexity of the human mind and its capacity to entertain and justifiably believe an infinite number of propositions, there is nothing vicious about the relevant regresses we face. There is no reason to suppose that we would be unable to justify every proposition we believe by appeal to some other different proposition which we justifiably believe. Infinitism is a view that should be seriously considered, particularly once one realizes that one not only can but does have an infinite number of justified beliefs (e.g., that 2 is greater than 1, that 3 is greater that 1, and so on.). It is not clear, however, that even if the infinitist can cope with the epistemic regress argument foundationalism, he has a response to the conceptual regress argument discussed earlier.

Although anti-foundationalists are not always eager to admit it, I suspect that the primary dissatisfaction with classical foundationalism lies with the difficulty the view has avoiding radical skepticism. On infallible belief, infallible justification, or direct acquaintance theories of foundational justification, there is precious little included in the foundations of knowledge. Most classical foundationalists reject the idea that one can have noninferentially justified beliefs about the past, but the present disappears into the past in the blink of an eye. How can one even hope to get back the vast body of knowledge one pre-philosophically supposes one has, if one's epistemic base is so impoverished. If the second clause of the Principle of Inferential Justification were accepted, the problem is even more serious. One might be able to convince oneself that one can know noninferentially the principles of deductive reasoning, but deduction will not take one usefully beyond the foundations of knowledge and justified belief. As Mill (1906, p. 126) argued, there is a very real sense in which one doesn't advance one's knowledge significantly employing a form of reasoning that takes one only to conclusions that were implicitly contained in the conjunction of one's premises. To advance beyond foundations we will inevitably need to employ non-deductive reasoning and according to PIJ that will ultimately require us to have noninferential (direct) knowledge of propositions describing probability connections between evidence and conclusions. It is not absurd on the face of it to suppose that one can have noninferential a priori knowledge of probabilistic connections, but it is perhaps an understatement to suppose that the view is not popular.[6]

4. Externalist Versions of Foundationalism

The epistemic landscape has changed dramatically in the last quarter of a century with the rise of externalist epistemologies. It is notoriously difficult to define clearly the controversy between internalists and externalists in epistemology.[7] It is sometimes taken to be a controversy over whether or not one can

identify epistemic properties with "internal" states of believers. Others seem to think that the controversy centers over the question of whether one requires certain sorts of access (or potential access) to the states or properties that constitute having justification. Certainly, paradigm externalists would reject the second clause of the principle of inferential justification. According to virtually all externalists, one can arrive at a justified belief in P by inferring it from E without being aware of any sort of evidential connection between E and P.

While the externalist defends radically different views than those of classical foundationalists, the structure of knowledge and justification that emerges from such theories is still often a foundationalist structure. We might first illustrate the point by examining the view defended by the most prominent of the externalists, Alvin Goldman's reliabilism.[8]

The fundamental idea behind reliabilism is strikingly simple. Justified beliefs are reliably produced beliefs. Justified beliefs are worth having because justified beliefs are probably true. Goldman initially distinguished, however, two importantly different sorts of justified beliefs--those that result from belief-independent processes and those that result from belief-dependent processes. The former are beliefs that are produced by "software" of the brain that takes as its "input" stimuli other than beliefs; the latter are beliefs produced by processes that take as their input at least some other beliefs.. So, for example, it is possible that we have evolved in such a way that when prompted with certain sensory input we immediately and unreflectively reach conclusions about external objects. And we may live in a world in which beliefs about the external world produced in this way are usually true (or would usually be true if enough of them were generated).[9] Such beliefs will be justified by virtue of being the product of reliable belief-independent processes. They can in turn be taken as input for reliable belief-dependent processes in order to generate still more justified beliefs. A belief-dependent process is reliable if its out beliefs are usually (or would usually) be true if the relevant input beliefs are true, and the output beliefs of reliable belief-independent processes are justified provided that the input beliefs are justified.[10]

The above is but the crudest sketch of Goldman's early reliabilism--he later modified it to deal with a number of objections. But the sketch is enough to bring out the foundationalist structure inherent in a reliabilist account. The reliabilist actually accepts the first clause of PIJ, but avoids both the epistemic and conceptual regresses by embracing a kind of justified belief that does not owe its justification to the having of other different justified beliefs. That the reliabilist is concerned with avoiding the conceptual regress is clear from the fact that the analysis offered is explicitly recursive. The base clause of the recursive analysis in effect captures the concept of a noninferentially justified belief.

I have illustrated the way in which an externalist account of justified belief can exemplify a foundationalist structure by examining one of the most prominent versions of externalism, reliabilism. But other versions of externalism are also implicitly or explicitly committed to a version of foundationalism, or, at the very least, give an account of justification that would enable one to distinguish noninferential from inferential justification, direct from indirect knowledge. Consider, for example, a crude version of the so-called causal theory of knowledge according to which one knows a proposition when one believes it and the belief is caused (in the "right" way) by the very fact that makes true what is

believed. Obviously, on such an account one can distinguish causal chains leading to the belief in question that involve intermediate beliefs from those that do not, and using this distinction one can again define a distinction between direct and indirect knowledge.[11]

Externalist versions of foundationalism are probably attractive to many because they often allow at least the possibility of a much expanded foundational base of justified beliefs. The reliabilist's noninferentially justified beliefs, for example, might be produced by processes that are not even very reliable. Unlike the Cartesian, the reliabilist's distinction between noninferentially and inferentially justified belief has nothing to do with how probable it is that the belief in question is true. If nature has been co-operative enough to insure the evolution of cognitive agents who respond to their environmental stimuli with mostly true beliefs then there might be an enormous store of foundational knowledge upon which we can draw in arriving at inferentially justified conclusions. On most externalist accounts of noninferentially justified belief there are literally no *a priori* constraints on what might end up being noninferentially justified.

A full evaluation of externalist versions of foundationalism is far beyond the scope of this article. The very ease with which the externalist can potentially broaden the foundational base of noninferentially justified belief is, ironically, one of the primary concerns of those philosophers unhappy with externalist epistemology. Many internalists are convinced that externalists are simply re-defining epistemic terms in such a way that they lose the kind of meaning that the philosopher wants them to have in order to ask the kind of penetrating philosophical questions that are the peculiar product of a kind of philosophical curiosity. When a philosopher starts looking for justification in support of a belief, the internalist will argue, the philosopher is interested in achieving a state in which a kind of philosophical curiosity is satisfied. That philosopher wants epistemic justification to provide a kind of assurance of truth. If I'm wondering whether or not I have justification to believe that God exists, I'm hardly going to think that my question has been answered when I'm told by the reliabilist that I might have a reliably produced belief that God exists or when I'm told by the causal theorist that my belief that God exists might be caused by the very fact that God exists. As far as satisfying intellectual curiosity, exemplifying reliably-produced belief or belief caused by the right fact is no more useful than having true belief. If I were to stipulate a technical sense of foundational knowledge* according to which I foundationally know that P when I believe truly that P and my belief isn't caused by any other belief, there may well be all sorts of truths I "know", but will having such knowledge do me any good as far as putting me in a state that satisfies my philosophical curiosity?

Stanford Encyclopedia of Philosophy
Notes to Foundationalist Theories of Epistemic Justification

Notes

1. Foundational knowledge or justified belief has also been called by foundationalists direct knowledge (justification), immediate knowledge, intuitive knowledge (justification); and the truths known have been referred to as self-evident truths, directly evident truths, self-presenting truths, and the given. This last locution "the given" is, however, ambiguous as between *truths* that are said to be known directly and *facts* or features of the world that are said to be immediately "before" consciousness.

2. For present purposes let us construe entailment broadly so that P may be said to entail Q if P formally, analytically or synthetically entails Q.

3. See, for example, Russell (1910-11) and 1913.

4. For a more detailed account and defense of an acquaintance theory of noninferential justification see Fumerton (1995). BonJour, once one of the leading coherence theorists of empirical justification, has recently moved to a version of the acquaintance theory of justification. See BonJour (2000).

5. For a further elaboration of such a view see Fumerton (1995).

6. For an excellent discussion of this issue see Russell (1948).

7. For a detailed discussion of alternative ways of defining the internalism/externalism controversy, see Fumerton (1995), Chapters 3 and 4.

8. Most of what I say here is based on the early seminal paper "What is Justified Belief." Goldman's view changed quite dramatically in his book *Epistemology and Cognition*, but shortly after publishing the book he returned to the earlier account for at least one conception of justification (strong justification). See Goldman (1988).

9. We shall not concern ourselves with the difficulties that reliabilists face defining the relevant notion of reliability--as these few remarks might indicate, reliabilists will inevitably move beyond actual frequencies and turn to propensities or counterfactuals in defining the concept of a reliable belief-producing process.

10. For technical reasons, it might, perhaps, be better to require that the conjunction of the propositions

believed must itself be the object of a justified belief.

11. See, for example, Armstrong's (1973) account of direct knowledge. Though more complicated that a causal theory of knowledge, Nozick's (1981) "tracking" account of knowledge also allows a distinction between beliefs which noninferentially track facts and beliefs which inferentially track facts.

Skepticism

Much of epistemology has arisen in defense or in opposition to various forms of skepticism. Indeed, one could classify various theories of knowledge by their responses to skepticism. For example, rationalists could be viewed as skeptical about the possibility of empirical knowledge while not being skeptical with regard to a priori knowledge and empiricists could be seen as skeptical about the possibility of a priori knowledge but not so with regard to empirical knowledge. In addition, many traditional problems, for example the problem of other minds or the problem of our knowledge of God's existence, can be seen as *restricted* forms of skepticism which hold that we cannot have knowledge of any propositions in some particular domain thought to be within our ken. Although this essay will comment briefly about some restricted forms of skepticism, it will focus on the *general* forms of skepticism which question our knowledge in many, if not all, domains in which we ordinarily think knowledge is possible. Since this essay is not primarily devoted to a discussion of the history of philosophical skepticism, the general forms of skepticism to be discussed are those which contemporary philosophers still find the most interesting.

1. Philosophical Skepticism vs. Ordinary Incredulity

Even before examining the various forms of skepticism, it is crucial that we distinguish between philosophical skepticism and ordinary doubt because doing so will help to explain why philosophical skepticism is so intriguing. Consider an ordinary case in which we think someone fails to have knowledge. Suppose Anne claims that she knows that the bird she is looking at is a robin and that I believe that if Anne were to look carefully, she would see that its coloration is not quite that of a robin. Its breast is too orange. Further, I believe that it flies somewhat differently than robins do. This bird seems to flitter more than a typical robin.

Thus, there are two grounds for doubting that Anne knows that this is a robin:

a. The color of this bird isn't typical of robins;
b. The flight pattern of this bird is not typical of robins.

Now, what makes this a case of ordinary doubt is that there are, in principle, two ways of removing the basis for doubt:

i. Anne could show that the alleged grounds for doubt are false; or
ii. Anne could show that the grounds for doubt, though true, can be neutralized.[1]

Taking alternative (i), Anne could show that there are many robins with the coloration of the bird in question by citing the *Audubon Field Guide for Birds* in which many of the pictured robins have very orange breasts. In other words, Anne could show that (a) is false.

But in order to remove grounds for doubt, it is not necessary that Anne show that the alleged grounds are false. Consider ground (b). It could be granted that the bird in question flies in a way that is not at all typical of robins. But suppose that on closer inspection we see that some of its tail feathers have been damaged in a way that could account for the unusual flight pattern. Because the bird has difficulty gliding and flying in a straight line, it flaps its wings much more rapidly than is typical of robins. Thus, although we can grant that (b) is true, we would have explained away, or neutralized, the grounds for doubt.

The point here is that in this case, and in all *ordinary* cases of incredulity, the grounds for the doubt can, in principle, be removed. As Wittgenstein would say, doubt occurs within the context of things undoubted. If something is doubted, something else must be held fast because doubt presupposes that there are means of removing the doubt.[2] We doubt that the bird is a robin because, at least in part, we think we know how robins typically fly and what their typical coloration is. That is, we think our general picture of the world is right -- or right enough -- so that it does provide us with both the grounds for doubt and the means for potentially removing the doubt. Thus, ordinary incredulity, say about some feature of the world, occurs against a background of sequestered beliefs about the world. We are not doubting that we have any knowledge of the world. Far from it, we are presupposing that we do know some things about the world. To quote Wittgenstein, "A doubt without an end is not even a doubt" (Wittgenstein 1969, ¶ 625).

In contrast, philosophical skepticism attempts to render doubtful *every* member of a class of propositions that we think falls within our ken. One member of the class is not pitted against another. The grounds for either withholding assent to the claim that we can have such knowledge or denying that we can have such knowledge are such that there is no possible way to either answer them or neutralize them by appealing to another member of the class. Thus, philosophic doubt or philosophical skepticism, as opposed to ordinary incredulity, does not, in principle, come to an end. Or so the philosophic skeptic will claim!

To clarify the distinction, let us consider a restricted form of ordinary incredulity and a restricted form of philosophical skepticism. Suppose that I claim that although you might think you know that John is unconcerned about the doctor's report he just received, John is really just putting up a brave front so as not to alarm his family. My basis for doubt could be removed, or at least somewhat mitigated, if he acts in the same fashion when he thinks no one is observing him. Both my basis for doubting that he was unconcerned and the manner of removing the doubt presupposes that we can know the contents of other minds.

Now, contrast that case with one in which a basis is proposed for philosophical skepticism about our purported knowledge that John is unconcerned about the report. Here the grounds are that in order to know the contents of someone else's mind, my reasoning must employ an argument from analogy that is too weak to establish its conclusion. The form of the argument the skeptic is referring to could be put as follows:

1. Typically, when I behave in some way, *b*, I am in some mental state, *m*.	[by observation and introspection]
2. When someone else, say *S*, is behaving in way *b*, S is in mental state *m*.	[by analogy from 1]
3. *S* is behaving in way *b*.	[by observation]
4. *S* is in mental state *m*.	[from 2, 3]

The skeptic could point out that the analogy in 2 is illegitimately employed because arguments from analogy must be based upon more than one example. Since there can never be more than one case in which I note the correlation between mental states and behavior (namely, my own), I could never legitimately employ such an argument.

Now whether this restricted form of philosophical skepticism is plausible is not the issue here. The point is to make clear the distinction between ordinary incredulity and philosophical skepticism. Ordinary incredulity arises within the context of other propositions of a similar sort taken to be known, and it can be removed by discovering some further proposition of the relevant type. On the other hand, philosophical skepticism about a proposition of a certain type derives from considerations that are such that they cannot be removed by appealing to additional propositions of that type -- or so the skeptic claims.

This case illustrates one other fundamental feature of the philosophical arguments for skepticism, namely, that the debate between the skeptics and their opponents takes place within the evidentialist account of knowledge which holds that knowledge is at least true, sufficiently justified belief. The debate is over whether the grounds are such that they can make a belief sufficiently justified so that a responsible epistemic agent is entitled to assent to the proposition.[3] The basic issue at stake is whether the justification condition can be fulfilled. A corollary of this is that strictly reliabilist or externalist responses to philosophic skepticism constitute a change of subject. A belief could be reliably produced, i.e., its causal pedigree could be such that anything having that causal etiology is sufficiently likely to be true, but the reasons available for it could fail to satisfy the standards agreed upon by both the skeptics and their opponents.

2. Two Basic Forms of Philosophical Skepticism

Consider some proposition, *p*. There are just three possible propositional attitudes one can have with regard to *p*'s truth when considering whether *p* is true. One can either assent to *p*, or assent to ~*p* or withhold assenting both to *p* and to ~*p*. Of course, there are other attitudes one could have toward *p*. One could just be uninterested that *p* or be excited or depressed that *p*. But those attitudes are either ones we have when we are *not* considering whether *p* is true or they are attitudes that result from our believing, denying or withholding *p*. For example, I might be happy or sorry that *p* is true when I come to believe that it is.

I just spoke of "assent" and I mean to be using it to depict the pro-attitude, whatever it is, toward a proposition that is required for knowing that proposition. Philosophers have differed about what that attitude is. Some take it to be something akin to being certain that *p* or guaranteeing that *p* (Malcolm 1963, 58-72). Others have taken it not to be a form of belief at all because, for example, one can know that *p* without believing it as in cases in which I might in fact remember that Queen Victoria died in 1901 but not believe that I remember it and hence might be said not to believe it (Radford 1966). For the purposes of this essay we need not attempt to pin down precisely the nature of the pro-attitude toward *p* that is necessary for knowing that *p*. It is sufficient for our purposes to stipulate that assent is the pro-attitude toward *p* required to know that *p*.

Let us use "EI-type" propositions to refer to **epistemically interesting** types of propositions. Such types of propositions contain tokens some of which are generally thought to be known given what we ordinarily take knowledge to be. Thus, it would *not* be epistemically interesting if we did not know exactly what the rainfall will be on March 3 ten years from now. That kind of thing (a fine grained distant future state) is not generally thought to be known given what we ordinarily take knowledge to be. But it would be epistemically interesting if we cannot know anything about the future, or anything about the contents of someone else's mind, or anything about the past, or anything at all about the "external world." We think we know many propositions about those types of things.

Now, consider the (meta) proposition concerning the scope of our knowledge, namely: *We can have knowledge of EI-type propositions.* Given that there are just three stances we can have toward any

proposition when considering whether to assent to it, we can:

i. Assent that we can have knowledge of EI-type propositions.
ii. Assent that we cannot have knowledge of EI-type propositions.
iii. Withhold assent to both that we can and that we cannot have knowledge of EI-type propositions.

Let us call someone with the attitude depicted in (i) an "Epistemist."[4] Such a person assents to the claim that we can have knowledge of EI-type propositions.

The attitude portrayed in (ii) has gone under many names. I will follow the terminology suggested by Sextus Empiricus. He used the term "Academics" to refer to the leaders of the Academy (founded by Plato) during the 3rd to 1st century B.C. According to Sextus, they assented to the claim that we cannot have knowledge of what I have called EI-type propositions -- although it is far from clear that this was an accurate description of their views. (See the entry on ancient skepticism.) Perhaps the prime example was Carneades (214-129 B.C.). Other philosophers will refer to this view as "Cartesian skepticism" because of the arguments investigated by Descartes and his critics in the mid-17th century. And still others will refer to it as "switched world skepticism" or "possible world skepticism" because the arguments for it typically involve imagining oneself to be in some possible world that is both vastly different from the actual world and at the same time absolutely indistinguishable (at least by us) from the actual world. What underlies this form of skepticism is assent to the proposition that we cannot know EI-type propositions because our evidence is inadequate.

Those assenting neither to the proposition that knowledge of EI-type propositions is possible nor to the proposition that such knowledge is not possible can be called "Pyrrhonian Skeptics" after Pyrrho who lived between ca 365 - ca 275 B.C. The primary source of Pyrrhonian Skepticism is the writing of Sextus Empiricus who lived at the end of the second century AD. The Pyrrhonians withheld assent to every non-evident proposition. That is, they withheld assent to all propositions about which genuine dispute was possible, and they took that class of propositions to include the (meta) proposition that we can have knowledge of EI-type propositions. Indeed, they sometimes classified the Epistemists and the Academic Skeptics together as dogmatists because the Epistemists assented to the proposition that we can have knowledge, while the Academic Skeptics denied that we can have knowledge.[5]

Another difference between Academic and Pyrrhonian Skepticism is closely related to the charge by the latter that the former is really a disguised type of dogmatism. The Academic Skeptic thinks that her view can be shown to be the correct one by an argument (or by arguments). The Pyrrhonian would point out that the Academic Skeptic maintains confidence in the ability of reason to settle matters -- at least with regard to the extent of our knowledge of propositions in the EI-class. One way of understanding the so-called problem of the "Cartesian circle" illustrates the Pyrrhonian point: Descartes is relying throughout the *Meditations* on his power of reasoning to remove the skeptical doubts that he raises, but to do so means that he has exempted the faculty of reasoning from the doubts that he raised in the "First Meditation" about the epistemic reliability of our faculties. A Cartesian reply could be as simple as paraphrasing Luther: Here I stand, as a philosopher with confidence in reason, and as such I can do no

other.[6] Regardless of the adequacy of that kind of response, the point here is that the Pyrrhonians did not think that they had a convincing argument whose conclusion was that withholding assent to non-evident propositions was the appropriate epistemic attitude to have.

I think it is fair to say that Academic Skepticism is usually what is meant when most contemporary philosophers write about skepticism. Thus, it is that form of skepticism to which we will now turn and it is that form that will be the primary focus of this essay, although we will discuss some aspects of Pyrrhonism later.

3. Academic Skepticism

A way to motivate Academic Skepticism and to clearly distinguish it from ordinary incredulity is to trace the way in which Descartes expanded the realm of what was doubtful (and hence not worthy of assent) in the "First Meditation."[7] Descartes begins by noting that the senses have deceived him on some occasions and, in the voice of his skeptical interlocutor, he conjectures that it is never prudent to trust what occasionally misleads. So, we don't have "certain" knowledge of the external world based upon the testimony of our senses. However, in the voice of the non-skeptical interlocutor, he replies that even though the senses have misled him, he can neutralize that purported basis for doubt by pointing out that we are able to determine when our senses are not trustworthy. Thus, this is a case of ordinary incredulity because he appeals to some knowledge of the world gained through our senses to neutralize this basis for doubt. For example, in looking at a straight stick in water, even though it appears bent, we know not to accept the testimony of our senses at face value. We can neutralize the potentially knowledge-robbing proposition *that my senses have deceived me on some occasions* by adding to it another proposition to which we assent. Some propositions in the EI-type (propositions about the external world) can be used to rebuff the grounds for ordinary incredulity. Thus, no basis for (philosophical) Academic Skepticism has been located.

Descartes next considers dreaming. What if he were dreaming at that very moment? Would he still have some knowledge of the external world? Yes; because in dreams and in waking life there are some common general features. So, if he were dreaming, he would not know in particular what is going on about him at that moment, but that does not imply that he fails to have any knowledge at that moment. For example, he still could know that there are hands. More importantly, even more simple things about nature "in general" are not thereby made doubtful. We have not found any reason for doubting that there are material objects or that they have a spatial location, or are in motion or at rest, or can exist for a long or short period of time. Again, no basis for Academic Skepticism has been established.

But then Descartes thinks of a grounds for doubt for which he says he "certainly has no reply." He puts it this way:

> … In whatever way [it is supposed] that I have arrived at the state of being that I have reached -- whether [it is attributed] to fate or to accident, or [made] out that it is by a continual succession of antecedents, or by some other method -- since to err and deceive

> oneself is a defect, it is clear that the greater will be the probability of my being so imperfect as to deceive myself ever, as is the Author of my being to whom [is assigned] my origin the less powerful. (*Meditations*, 147)

In other words, at this point in the *Meditations*, since he lacks an argument for the claim that whatever is causally responsible for his "state of being" is capable of making his being such that to err would not be natural for it, assenting to propositions arrived at by his "state of being" is not legitimate. Thus, Descartes believes that he has located a basis for doubting all of his supposed former knowledge of the external world that cannot be repulsed by locating another such proposition to which he is entitled. He has found a proposition that, if true, would (by itself) defeat the justification he has for his assenting to propositions about the external world and which is such that (1) he does not (at least at this point in the *Meditations*) have a way to reject it and such that (2) he has no way to neutralize its effect. Thus, a basis for philosophical skepticism has been found because an entire class of EI-type propositions -- propositions that his "nature" has led him to assent to -- is now thrown into doubt because he cannot use one member of the class to reject or neutralize the basis for doubting another member of the class.

Descartes apparently thinks that something is worthy of assent only if it is immune to genuine doubt. Something, *d*, is a grounds for genuine doubt of *p* for *S* iff:

1. *d* added to *S*'s beliefs makes assent to *p* no longer adequately justified;
2. *S* is not justified in rejecting *d*;[8]
3. *S* has no way to neutralize *d*.[9]

The final step is to say that some proposition is not worthy of assent if there are genuine grounds for doubting it. Indeed, Descartes grants that even after *d* is located, *p* might still be more reasonable to believe than to deny (*Meditations*, 148). The point is that the pro-attitude should not rise to the level required for knowledge because there is a genuine ground for doubt. Thus, a crucial feature of the Cartesian-style argument for Academic Skepticism is that it employs a very stringent requirement on the type of evidence required for knowledge. It must make a proposition immune to genuine doubt.

To make that clear, let us state the epistemic principle, which we can call the "Eliminate All Doubt Principle," that apparently informs the Cartesian-style argument:

> **Eliminate All Doubt Principle** [**EAD**]:
> For all propositions *x* and *d*, if *d* provides a basis for genuine doubt that *x*, then if assenting to *x* is adequately justified for *S*, then *S* is adequately justified in eliminating *d*.

In more contemporary terminology, the ground for doubt proposed by Descartes can be put like this:

> **U**: My epistemic equipment is untrustworthy.

The *Cartesian-style argument for Academic Skepticism* can now be put like this:

1. If I know that *p*, then there are no genuine grounds for doubting that *p*.
2. **U** is a genuine ground for doubting that *p*.
3. Therefore, I do not know that *p*.

The Cartesian-style argument does not readily lend itself to the objection that by employing it the skeptic is contradicting herself on the grounds that the argument purportedly shows that she fails to know because her epistemic equipment is untrustworthy while at the same time she is employing the very equipment that, were the argument sound, would be unreliable. The reason is that she is neither asserting that her equipment is untrustworthy nor claiming that there is an argument which shows that her equipment is untrustworthy. She is merely claiming that **U** is a genuine ground for doubt. Thus she neither is holding contradictory beliefs nor is her practice somehow incompatible with her beliefs.

The Cartesian-style argument for Academic Skepticism should be contrasted with what many contemporary philosophers take to be the canonical argument for Academic Skepticism which employs the Closure Principle (CP).[10] Letting "*h*" stand for an EI-type proposition, for example, G. E. Moore's famous "here's a hand" and letting "*sk*" stand for "I am in a switched-world in which there are no hands, but it appears just as though there were hands," we can state the canonical *CP-style argument for Academic Skepticism* as follows:

> CP1. If I am justified in believing that *h*, then I am justified in believing that ~*sk*.
>
> CP2. I am not justified in believing that ~*sk*.
>
> Therefore, I am not justified in believing that *h*.

This argument appeals to a form of the Closure Principle in Premise 1. Letting "*Jsx*" stand for "*S* is justified in having some pro-attitude, *J*, regarding *x*," that principle can be stated as:

> **Closure Principle** [**CP**]:
> For all propositions *x* and *y*, if *x* entails *y*, and *Jsx*, then *Jsy*.

(In the CP-style argument: $x = h$ and $y = {\sim}sk$.)

A crucial feature of CP is that it does not depend upon employing a stringent notion of justification. Suppose that (positive) justification comes in degrees, where the lowest degree is something like mere plausibility and the highest degree is absolute certainty. CP could be recast as follows:

> **CP*:** For all propositions, *x* and *y*, if *x* entails *y*, and *Jsx* to degree *u*, then *Jsy* to degree *v* (where $u \leq v$).

Thus, when the Academic Skeptic employs CP (or CP*), she need not be employing a very stringent

notion of justification. That is the primary difference between the CP-style and the Cartesian-style argument for Academic Skepticism.

Another difference is that the Cartesian-style argument concerns knowledge, whereas the CP-style argument concerns justification (to whatever degree). Nevertheless, that difference is insignificant because the debate about the merits of skepticism takes place within the evidentialist account of knowledge. Knowledge is taken to entail adequately justified assent and, hence, "knowledge" could be replaced by "adequately justified assent" in the Cartesian style argument.

Let us return to the central difference between Cartesian and CP-style arguments, namely the former employs EAD while the later employs CP (or CP*). EAD requires that we eliminate any genuine grounds for doubt and those include more than mere contraries. In addition, recall that according to the Cartesian to be adequately justified in eliminating d as a ground for doubt for *x*, either *S* is adequately justified in denying *d* (assenting to ~*d*) or *S* is adequately justified in assenting to some neutralizing proposition, *n*, such that adding (*n* & *d*) to *S*'s beliefs fails to make it the case that *x* is no longer adequately justified.[11] Thus, since every contrary of some proposition is a potential genuine ground for doubt, EAD entails CP but CP does not entail EAD.[12] To see that, consider any contrary, say *c*, of a proposition, say *h*. The proposition, *c*, would be a potential genuine ground for doubting *h* since if *c* were added to *S*'s beliefs, h would no longer be adequately justified because *S*'s beliefs would then contain a proposition, *c*, that entailed the denial of *h*. Furthermore, the only way *S* could eliminate *c* as a ground for doubt would be by denying it, since nothing could neutralize it. Thus, EAD has the consequence that *if* S *is justified in assenting to h, then S is justified in denying every contrary of h*. But that is just an instance of CP, since (by hypothesis) *h* entails ~*c*. That CP does not entail EAD should be clear since there are grounds for doubting *h* that are not contraries of *h*. For example, the proposition, **U**, considered above is a grounds for doubting *h*, but *h* and **U** could both be true.

Thus, there are two basic forms of Academic Skepticism: The Cartesian-style argument that employs the strong EAD principle and the CP-style that employs the weaker CP. Since the CP-style skeptic employs the weaker epistemic principle, it will be best to begin by focusing on it because any criticisms of it are likely to redound to the stronger form.

4. The Argument for Academic Skepticism Employing the Closure Principle

There *appear* to be only three ways that one can respond to the CP-style skeptical argument: deny at least one premise, deny that the argument is valid, or reluctantly accept the conclusion -- if neither of the first two alternatives succeeds. I say "appear" because I will mention later a fourth alternative that is available to the Pyrrhonian Skeptic. The second alternative -- denying the validity of the argument -- has not been taken because it would lead to embracing an extremely severe form of skepticism. If one were to deny that *modus tollens* is a valid form of inference, one would also have to deny the validity of (i) disjunctive syllogism or (ii) *modus ponens* and contraposition, since it is easy to transform *modus tollens* arguments

into ones employing the other forms of inference. Hence, if this alternative were chosen, reasoning would apparently come to a complete standstill. That, presumably, is why no one has ever seriously considered this alternative.

So, if we are not to reluctantly embrace the conclusion, it *appears* as though we must reject either the first premise -- an instantiation of closure -- or the second premise.

Consideration of CP1

Let us begin an examination of CP1 and the general closure principle of which it is an instantiation. The basic issue is this: Does closure hold for justified belief?

Closure certainly does hold for some properties, for example, truth. If *p* is true and it strictly implies *q*, then *q* is true. It just as clearly does not hold for other properties. If *p* is a belief of mine, and *p* strictly implies *q*, it does not follow that *q* is a belief of mine. I might fail to see the implication or I might be "wired" incorrectly (from birth or as the result of an injury) or I simply might be epistemically perverse. I might, for example, believe all of the axioms of Euclidean plane geometry, but fail to believe (or perhaps even refuse to believe) that the exterior angle of a triangle is equivalent to the sum of the two opposite interior angles.

What about justified belief? It is easy to see that, as stated above, CP (or CP*) is clearly false. Every necessary truth is entailed by every proposition, and we can be justified in believing a false proposition. But one surely does not want to claim that *S* is justified in believing *every* necessary truth whenever *S* has some justified belief in a false proposition. In addition, some entailments might be beyond *S*'s capacity to grasp. Finally, there might even be some contingent propositions that are beyond S's capacity to grasp which are entailed by some propositions that *S* does, indeed, grasp. And it might be thought that *S* is not entitled to believe anything that *S* cannot grasp.

But it appears that CP can easily be repaired. We can stipulate (i) that the domain of the propositions in the generalization of CP includes only contingent propositions that are within *S*'s capacity to grasp and (ii) that the entailment is "obvious" to *S*. The skeptic can agree to those restrictions because the skeptical scenarios are posited in such a way as to render it obvious that our ordinary beliefs are false in those scenarios, and it is taken to be a contingent claim that *S* is in the actual circumstances as described in the antecedent. There is one other required clarification of the restricted version of CP. "Justified belief" is ambiguous. It could be used to refer to a species of actually held beliefs -- namely, those actually held beliefs of *S* that are justified. Or it could refer to propositions that *S* is entitled to hold -- regardless of whether *S* does indeed hold them. If CP is to be acceptable, "justified belief" must be used so as to mean the latter for a reason already cited, i.e., belief does not transmit through entailment.

We are now in a position to ask: Does the restricted form of closure hold regarding what we are *entitled* to believe -- even if we don't, in fact, believe it?

There appears to be a perfectly general argument for the restricted version. Let *p* entail *q*, and *let us suppose* that *S* is entitled to believe that *p* iff *S* has (non-overridden) grounds that make *p* sufficiently likely to be true:[13]

1. If *S* is entitled to believe that *p*, then *S* has (non-overridden) grounds that make *p* sufficiently likely to be true. [by the supposition]
2. If *S* has (non-overridden) grounds that make *p* sufficiently likely to be true, then *S* has (non-overridden) grounds making *q* sufficiently likely to be true. [because *p* entails *q*]
3. If *S* is entitled to believe that *p*, then *S* has (non-overridden) grounds making *q* sufficiently likely to be true. [from 1,2]
4. If *S* has (non-overridden) grounds making *q* sufficiently likely to be true, then *S* is entitled to believe that *q*. [by the supposition]
5. Therefore, if *S* is entitled to believe that *p*, *S* is entitled to believe that *q*. [from 2,3]

The supposition mentioned above seems plausible given that the debate over the merits of Academic Skepticism employs an evidentialist account of justification. That is, the debate between the Academic Skeptic and the Epistemist is over whether *S* has adequate grounds for EI-type propositions such that those grounds make *p* sufficiently likely to be true. Premise 2 contains the key claim. In spite of the fact that the probabilities (whether subjective or objective) transmit through entailment, it has been challenged. Fred Dretske and others have produced cases in which they believe CP fails and fails precisely because Premise 2 in the general argument for CP is false.[14] Dretske writes:

> … something's being a zebra implies that it is not a mule … cleverly disguised by the zoo authorities to look like a zebra. Do you know that these animals are not mules cleverly disguised? If you are tempted to say "Yes" to this question, think a moment about what reasons you have, what evidence you can produce in favor of this claim. The evidence you *had* for thinking them zebras has been effectively neutralized, since it does not count toward their *not* being mules cleverly disguised to look like zebras. (Dretske 1970, 1015-1016)

Dretske is speaking of "knowledge" rather than beliefs to which one is entitled, but that seems irrelevant since the issue concerns the supposed lack of a sufficient source of evidence or reasons for the claim that the animal is not a cleverly disguised mule. In other words, Dretske grants that *S* has (non-overridden) grounds that make it sufficiently likely that the animals are zebras, but he holds that S does not have (non-overridden) grounds making it sufficiently likely that the animals are not cleverly disguised mules because S's evidence for the former has been "effectively neutralized."

The crucial thing to note about this proposed counterexample is that it works only if the Closure Principle entails that the *very same* source of evidence that justifies *S* in believing that the animals are zebras *must* justify *S* in believing that they are not cleverly disguised mules. Since the "evidence" for the former has been "effectively neutralized," it is not available for the latter. Now, in response one could claim that once the question of whether the animals are disguised mules has been raised, the evidence is "effectively neutralized" for *both* the former and the latter, and *S* is no longer justified in believing that the animals are

zebras. Thus, it could be held that this example could actually be used to *support* CP.

Nevertheless, let us grant that *S*'s evidence for the claim that the animals are zebras cannot be used to show that they are not cleverly disguised mules. It could be argued that this would not force giving up Premise 2 in the general argument for CP.

Such an argument could begin by recalling that Premise 2 claimed merely that whenever *S* had (non-overridden) grounds that make *p* sufficiently likely to be true, then *S* has (non-overridden) grounds for making *q* sufficiently likely to be true. It did *not* require that it was the very same grounds in both cases. Dretske's purported counterexample seems to require that CP implies that the adequate source of evidence is the same for both propositions. Thus, letting "*xRy*" mean that *x* provides an adequate evidence for *y*, the counter example depends upon assuming that if closure holds between *p* and *q*, then the evidence "path" must look like this:

Pattern 1

```
              ...Rp
             /
            /
...Re
            \
             \
              ...Rq
```

Evidence paths specify what propositions serve as good enough reasons, *ceteris paribus*, for believing other propositions. Dretske is supposing that the very same evidence, *e*, that I have for *p* must be adequate for *q* whenever *p* entails *q*.

No doubt this constraint sometimes correctly portrays the relevant evidential relationships when some proposition, *p*, entails some other proposition, *q*. For example, suppose I have adequate evidence for the claim that Anne has two brothers, then it would seem that the very same evidence would be adequate for believing that Anne has at least one brother. But the defender of CP, and more particularly the Academic Skeptic, could point out that closure need not require that type of evidence path in all cases in which one proposition entails another.

Two are two other possibilities for instantiating closure that are captured by Premise 2 that can be depicted as follows:

Pattern 2

… **ReRp**… **Rq**

Pattern 3

… **Re**(where *e* includes *q*)… **Rp**

In Pattern 2 cases there is some adequate evidence, *e*, for *p*; and *p*, itself, is the adequate evidence for *q*, since *p* strictly implies *q*. For example, if I have adequate evidence for believing that 2 is a prime number, I can use that proposition as an adequate reason for believing that there is at least one even prime. Indeed, consider any belief arrived at as a result of deductive inference. In such a case, we legitimately infer the entailed proposition from the conjunction of the premises that entails it. The plausibility of the famous Gettier cases depends upon Pattern 2 type cases in which closure holds. Gettier says:

> … for any proposition *p*, if *S* is justified in believing *p*, and *p* entails *q*, and *S* deduces *q* from *p* and accepts *q* as a result of this deduction, then *S* is justified in believing *q*. (Gettier 1963, 122)[15]

In Pattern 3 cases the order of the evidence is reversed because *q* serves as part of the evidence for *p*. For example, I am justified in believing that water is present if I am justified in believing that there is present a clear, odorless, watery-tasting and watery-looking fluid at standard temperature and pressure. This pattern is typical of abductive inferences. In addition, there are cases in which some contraries of *h* need to be eliminated prior to *h*'s being justified. For example, in the zebra-in-the-zoo case, if I had some reason to think that the animals were cleverly disguised mules, then it could be argued that such a contrary would need to be eliminated *before* I would be justified in believing that the animals were zebras.

The crucial point for the discussion here is that granting that there is no Pattern 1 type evidence path available to *S* in the zebra-in-the-zoo case does not require relinquishing premise 2 in the general argument for CP. The reason is simply that CP does not entail that there is Pattern 1 type evidence available in every case in which *p* entails *q*. Indeed, it could be suggested that the animals looking like zebras in a pen marked "zebras" is, *ceteris paribus*, adequate evidence to justify the claim that they are zebras; and once *S* is entitled to believe that the animals are zebras, *S* can, using the principle stated by Gettier, justifiably deduce that they are not cleverly disguised mules. That is, *S* can employ an evidence path like that depicted in Pattern 2. (See Klein 1981, 1995, and 2000a.) Further, if *S* had *some* reason to think that the animals were cleverly disguised mules, then *S* might have to eliminate that possibility before she could justifiably believe that they are zebras. In other words, *S* might have to employ an evidence path like the one depicted in Pattern 3. The point is that the Dretske-like counterexamples appear to depend upon the false claim that if Premise 2 in the general argument for CP is true, then the evidential relationship between the entailing and the entailed proposition is always correctly depicted by Pattern 1.

In addition to the purported counterexamples to closure that we have just examined, there are some

general theories of knowledge in which closure fails. Robert Nozick's account of knowledge is the best such example. Roughly his account is this (Nozick 1981, 172-187):

> *S* knows that *p iff*:
>
> 1. *S* believes *p*;
> 2. *p* is true;
> 3. if *p* were true, *S* would believe *p*;
> 4. if *p* were not true, *S* would not believe *p*.

This account is often referred to as a tracking account of knowledge because whenever *S* knows that *p*, *S*'s beliefs track *p*. Think of a guided missile *tracking* its target. If the target moves left, the missile moves left. If the target moves right, the missile moves to the right. According to the tracking account of knowledge our beliefs must track the truth as a guided missile tracks its target.

There is one important clarification of conditions 3 and 4 discussed by Nozick, namely, that the method by which *S* acquires the belief must be held constant from the actual world to the possible world. A doting grandmother might know that her grandchild is not a thief on the basis of very good evidence, but would still believe that he wasn't a thief, even if he were, because she loves him. So, we must require that the grandmother use the same method in both the actual and the near possible worlds, for otherwise condition 4 would exclude cases of knowledge. This is not the place to provide a full examination of Nozick's account of knowledge.[16] What is crucial for our discussion is that it is easy to see that closure will fail for knowledge in just the kind of case that the Academic Skeptic is putting forward because of condition 4. Suppose *S* knows that there is a chair before her. Would she know that she is not in a skeptical scenario in which it merely appears that there is a chair? If the fourth condition were true, she would not know that because if she were in such a scenario, she would be fooled into thinking that she wasn't. Thus, either condition 4 is too strong or CP fails.

There are some reasons for thinking that condition 4 is too strong. Consider a relatively simple case in which *S* seems to have knowledge but condition 4 does not obtain. *S* looks at a thermometer that is displaying the temperature as 72 degrees. The thermometer is working perfectly and *S* comes to believe that the temperature is 72 degrees by reading the thermometer and coming to believe what it says. But if the temperature were not 72, suppose that something would affect the thermometer in a way that made it read "72," so that by employing the same method (looking at the thermometer and coming to believe what it reads) *S* would still believe that it was 72. (One could imagine all kinds of circumstances that would have that causal result. A comical one: Imagine a lizard that is now sleeping on the thermometer that would stir were the temperature to rise, thus dislodging a small rock that hits the thermometer breaking the mercury column in a way that makes the thermometer still read 72.)

Or consider this case in the literature: You put a glass of ice-cold lemonade on a picnic table in your back yard. You go inside and get a telephone call from a friend and talk for half an hour. When you hang up you remember that you had left the ice-cold lemonade outside exposed to the hot sun and come to believe

that it isn't ice-cold anymore. It would seem that you could know that even if in some near world a friend of yours who just happened to be walking by noticed the glass and happening to have a cooler full of ice with him put the glass of lemonade in the cooler to keep it ice-cold for you. Thus, if the lemonade were still ice-cold, you would believe that it wasn't. (See Vogel 1987, 206.)

The moral of these cases seems to be that *S* can know that *p* even if there are some near possible worlds in which *p* is false but *S* still believes that *p* (employing the same method of belief formation). Indeed, it could plausibly be maintained that what is required for knowledge is that the method of belief formation work in this world -- exactly as it is -- even if the method would fail were there to be some slight variation in the actual world.

Further Clarification of Closure

In order to clarify CP further, it would be useful to contrast it with a stronger principle. I have already pointed out that in some cases some contraries of *h* need to be eliminated before *h* becomes justified. Suppose, however, that the skeptic requires that all contraries to *h* be eliminated before *h* is justified. That is *much* stronger than CP because CP is compatible with Pattern 1 and Pattern 2 type evidential relationships. In neither is every contrary to h eliminated prior to *h*. In Pattern 2, the contrary of h is eliminated after *h*; in Pattern 1, *h* is arrived at and its contrary is eliminated simultaneously. Keith Lehrer *might* be appealing to the stronger principle when he writes:

> … generally arguments about where the burden of proof lies are unproductive. It is more reasonable to suppose that such questions are best left to courts of law where they have suitable application. In *philosophy* [emphasis added] a different principle of agnoiology [the study of ignorance] is appropriate, to wit, that no hypothesis should be rejected as unjustified without argument against it. Consequently, if the sceptic puts forth a hypothesis inconsistent with the hypothesis of common sense, then there is no burden of proof on either side … . (Lehrer 1971, 53)

The passage is a bit ambiguous, but it will serve to illustrate my point, namely that there is a very strong principle -- call it the "**Eliminate All Contraries First** Principle" [EACF Principle] -- which requires that all evidence paths exhibit Pattern 3.

If EACF were accepted, there is a really easy route to Academic Skepticism. Consider any two contraries, c_1 and c_2. In order to be justified in believing c_1, *S* would first have to eliminate c_2. And in order to be justified in believing that c_2, *S* would first have to eliminate c_1. So, of course, *S* could never either be justified in believing c_1 or be justified in believing c_2. It could be plausibly argued that this is a too quick and too dirty argument for skepticism because in so far as skepticism remains an interesting philosophical position, the skeptic cannot impose such an outrageous departure from our ordinary epistemic practices.

There is a related point worth mentioning. If it were required that the evidence, *e*, for some hypothesis, *h*, must contain the denials of all the contraries of *h*, it is clear that *e* would have to entail *h*. To see that, note

that (~*h* & *p*) as well as (~*h* & ~*p*) are contraries of *h*, and that {~(~*h* & *p*), ~(~*h* & ~*p*)} entails *h*. Thus, if the skeptic were to adopt EACF, the evidence for *h* would have to entail *h*. (See Klein 1981, 100-104.) That requirement seems to be too strong for many, if not most, empirically contingent propositions.

Note that even EAD, although requiring that we be able to reject or neutralize every ground for doubt, does not require what EACF does. EAD does not require that we eliminate all of the grounds for doubt (including contraries) *before* we are justified in believing a hypothesis. Indeed, EAD allows for the possibility that we could use *h*, itself, or something that *h* justifies as the basis for rejecting or neutralizing some grounds for doubt.

Consideration of CP2

Now, with those clarifications of CP (and EAD) in mind, we can turn to CP2. It claims that we are not justified in denying the skeptical hypothesis -- in other words that we are not justified in believing that we are not being deceived. What arguments can be given for CP2? It is tempting to suggest something like this: The skeptical scenarios are developed in such a way that it is supposed that we *could not* tell that we were being deceived. For example, we are asked to consider that there is an Evil Genius "so powerful" that it could (1) make me believe that there were hands when there were none and (2) make it such that I *could* not detect the illusion. But the skeptic must be very careful here. She cannot require that in order for *S* to know (or be justified in assenting to) something, say *x*, that if *x* were false, she would not still assent to *x*. We have just seen (while examining Nozick's account of knowledge) that this requirement is too strong. So the mere fact that there could be skeptical scenarios in which *S* still believes that she is not in such a scenario cannot provide the skeptic with a basis for thinking that she fails to know that she is not (actually) in a skeptical scenario. But *even more importantly*, were that a requirement of knowledge (or justification), then we have seen that closure would fail and, consequently, the basis for the first premise in the CP-style argument for Academic Skepticism would be forfeited.[17]

In addition, we have also seen that if CP is true, and it did seem to be true, then there is one evidence pattern between entailing and entailed propositions that might prove useful to the Epistemist at this point in the discussion. If *S* could be justified in believing some proposition that entailed the denial of the skeptical hypothesis, then *S* could be justified in denying that hypothesis by employing evidence Pattern 2. Indeed, as G. E Moore suggested (1962, 242), what is to prevent the Epistemist from claiming that *S* is justified in denying that she is in a skeptical scenario because *S* is justified in believing that she has hands and CP is true? A plausible answer to Moore seems to be something like this: The issue that is under dispute is whether *S* is justified in assenting to (or knows that) she has hands. Thus, the Epistemist cannot reject CP2 by assuming the denial of the conclusion of the skeptical argument. All well and good. But the same sauce cooks the gander, and the skeptic cannot claim as the reason for CP2 that *since S* is not justified in believing that she has hands, she cannot avail herself of that as her reason for being justified in believing that she is not in a skeptical scenario.

So, what reason can the skeptic give for CP2? I do not know of one that has been offered that is consistent with the defense of CP and that does not beg the question. That is not to say that CP2 is false. Far from it.

Perhaps it is true. The issue here is whether we are justified in accepting or rejecting it. It seems that in order to accept it and CP, the skeptic would have to assert that *S* is not justified in believing that she has hands because evidence Pattern 2 depicts one way in which *S* could be justified in denying the skeptical scenario.[18]

I had mentioned earlier that there seemed to be only three responses available when confronting the CP-style argument for Academic Skepticism -- accept the conclusion, reject one or both of the premises, or deny the validity of the argument. The fourth alternative is simply to point out that given the required defense of CP1, there might be no good argument for CP2.

Of course, there is the possibility that there is also no good argument to the conclusion that we do have knowledge of EI-type propositions. Some might think that the Academic Skeptic wins in such a stand-off. But recall that what distinguishes the Academic Skeptic from the Pyrrhonian Skeptic is that only the Academic Skeptic assents to the claim that we cannot have knowledge. The Pyrrhonian Skeptic withholds judgement regarding whether we can have knowledge. And in a stand-off, the Pyrrhonian would seem to have appropriate attitude.

This concludes the discussion of CP-style skepticism. I would now like to briefly consider the second form of Academic Skepticism, namely the Cartesian-style that employs the Eliminate All Doubt Principle. Then, before we conclude our discussion of Academic Skepticism, I would like to consider one quite popular response to it -- contextualism.

5. The Cartesian-style Argument for Academic Skepticism Employing the Eliminate All Doubt Principle

This section can be brief because we can apply the lessons learned in the discussion of CP-style arguments to an evaluation of the Cartesian-style arguments that employ EAD. First, it should be clear that the general argument for the Closure Principle, considered earlier, cannot be used as a model for a general argument for EAD. That argument depended crucially on the fact that *h* entailed ~*sk*. (That is what provided the basis for premise 2 in the general argument for CP.) As we saw, the negation of a genuine ground for doubt need not be entailed by *h*. So, the skeptic has a much harder task in motivating EAD.

Nevertheless, let us grant that some argument could be provided that makes EAD plausible. The same dialectical issues that we have considered in discussing potential counterexamples to CP will recur regarding EAD. Reconsider the zebra-in-the-zoo case. But this time instead of the (contrary) proposition "the animals (I am seeing) are cleverly disguised mules," consider a potential ground for doubt, i.e., "there are cleverly disguised mules within my perceptual field," which according to EAD would have to be rejected or neutralized. Now, if the evidence I had for believing that the animals are zebras wasn't

adequate to deny the former, it is certainly not adequate for the denying the later. So the EAD skeptic will have to appeal to the analogs of Pattern 2 and Pattern 3 type cases in order to save the principle from a Dretske-like counterexample. Thus, the skeptic employing EAD would be put in the same dialectical situation as the CP-style skeptic because she must provide a basis for the second premise in her argument for Academic Skepticism that (1) is compatible with her required defense of EAD against Dretske-like objections and (2) does not beg the question or appeal to a requirement that all grounds for doubt must be eliminated prior to a proposition being justified.

To sum up: The Cartesian-style skeptic employing EAD is in a worse dialectical position than the skeptic employing CP. Whatever problems are associated with CP skepticism transfer to EAD skepticism and, in addition, there appears to be no plausible general argument for EAD while there was one for CP.

6. Contextualism[19]

Examining the contextualist diagnosis of Academic Skepticism and its suggested solution will allow us to explore a question that remains concerning CP and EAD. It could be held that such skeptics need not employ CP or EAD in general, but rather more restricted versions, namely merely their instantiations as they appear in their respective arguments. The skeptic could maintain that there is something quite special about the skeptical hypothesis such that even though closure might not hold in general between any entailing proposition and every proposition it entails, it does hold between such propositions as "here's a hand" and "it does not merely appear that here is a hand." Even more strongly, the skeptic could maintain that

only the Pattern 3 type evidence path correctly depicts the evidential relationships between those propositions. Hence, in order to be justified in believing the former I must *first* eliminate the latter. The requirement that we eliminate all contraries to some proposition, h, before we are entitled to believe that h is too stringent for ordinary contexts, for the reasons cited, but perhaps when engaged in doing philosophy we have to show that the skeptical hypothesis is false before the propositions of common sense are justified. That is essentially what the contextualists claim. They hold that in some contexts -- philosophical ones -- more stringent standards of evidence obtain than obtain in ordinary contexts.

There are two questions we should consider: Is contextualism about knowledge (or justified belief) the correct view to hold? If so, will it shed light on Academic Skepticism?

In answering the first question, it could be argued that contextualism with regard to the attribution of virtually any property is true. (Perhaps it doesn't apply to highly technical ones that only occur in one type of context.) For example, suppose that Mr. Lax says that Sam is happy. We discover that Lax is using "happy" to mean that a person is happy just in case he/she has had more happy moments than unhappy moments during a lifetime. Mr. Stringent demurs. For him, a person is happy only if he/she hardly ever experiences an unhappy moment.

Who is right about whether Sam is happy? Contextualists would say that they both could be because they are not using "happy" with the same criteria in mind. But it is crucial to note that given that each person recognizes that the other is applying different standards, Mr. Lax and Mr. Stringent can agree that, *given what Lax means*, Sam is happy and that, *given what Stringent means*, Sam is not happy.

Now, of course, we cannot employ *any* standards we please and still be speaking a common language. For

example, Mr. Lax cannot legitimately lower the standards so as to make it the case that Sam is happy simply because he *once* was happy for a very short period and, similarly, Mr. Stringent cannot require that Sam is happy only if it is *logically impossible* that Sam experience an unhappy moment. There is a limited range, albeit rather wide, of appropriate standards for the application of a term.

The predicates "having knowledge," "having adequate evidence," "being justified," and the like, do appear to be similar to most other predicates in this respect: Within a wide but non-arbitrary range of standards, speakers can legitimately demand that *S* have more or less of the relevant evidence for *p* before they will agree that "*S* knows that *p*" or "*S* has adequate evidence for *p*." So, the answer to the first question about the truth of contextualism seems to be: Contextualism about knowledge attributions is correct. It is just one instance of the general truth that standards for the application of a term vary within a wide but non-arbitrary range as determined by various features of the context.

Let us turn to the second and *much* more philosophically interesting question: Does the truth of this version of contextualism shed much, if any, light on Academic Skepticism? If it did, then the correct way to diagnose the dispute between the Academic Skeptic and the Epistemist would be to note that the Epistemist is using a lax standard and the skeptic a more stringent one. Having one's ordinary cake is compatible with eating one's skeptical cake because in the ordinary context we do have knowledge, but as standards rise to those employed by the skeptics, we do not have knowledge.

In response, it might be objected that this is not the proper diagnosis of the disagreement between the Academic Skeptic and the Epistemist. What the Academic Skeptic seems to be claiming is that we do not know what we ordinarily claim to know. We don't know EI-type propositions. That is, the Academic Skeptic claims that our ordinary knowledge claims are false. If she is merely claiming that on *her* standards we don't know, the skeptic's claims -- like those of Mr. Stringent -- can be granted and then promptly ignored because nothing that we formerly believed that we knew turns out to be not known. The scope of our knowledge or justified beliefs in the ordinary context is left intact.

Thus, the parallel with the case of Sam's putative happiness seems to break down. In that case, Mr. Stringent would grant that Mr. Lax is correct *given what Lax meant by "happy."* But the Academic Skeptic will not grant that the Epistemist is correct when he asserts that he has knowledge. The skeptic reasons that the Epistemist doesn't know that *h*, *even given what the Epistemist means by "know,"* because the Epistemist's justification for *h* isn't good enough. Indeed, the Academic Skeptic employing CP (or the stronger EAD) thinks that since there *cannot* be any evidence for ~*sk*, *h* could not be known.

The issue seems to boil down to this: In the ordinary context is it true -- as the Academic Skeptic claims -- that in order to know that there are hands, we must first eliminate the skeptical hypothesis?

The Epistemist could argue that this is not required. Suppose we are looking at Dretske's zebras and someone asks whether we have eliminated the possibility that those are cleverly disguised aliens from some planet thousands of light years from our solar system? Or that they are not super-robots newly invented by some very clever third graders in Mrs. Johnson's English class? Or that they are not members of the lost tribe of Israel disguised as zebras who have been hiding out from the Assyrians since the 8th

century BC. (They've had lots of time to perfect the disguise!)

Those are so far-fetched, the Epistemist could claim, that even if someone advancing those alternatives happens to believe them, there appears to be no reason why one should have to rise to the bait and eliminate those alternatives prior to being justified in believing that the animals are zebras. The Epistemist could continue by claiming that the skeptical hypothesis -- that we are not in the actual world but rather in one which seems identical to it -- is just as, or possibly even more, farfetched.

Thus the Epistemist could argue that try as she might, the Academic Skeptic cannot impose the burden of eliminating a farfetched hypothesis merely by raising it, even were she to believe it. On the other hand, the Epistemist could agree that in Dretske's zebra-in-the zoo case, if there really were some evidence, however slight, for the claim that the animals are painted mules, then Mr. Stringent might be able to legitimately require that *S* rule out that possibility prior to being justified in believing that the animals are zebras. But absent any evidence of that sort, the skeptic's requirements will fall on deaf ears. In parallel fashion, if there really were some evidence, however slight, that there is an evil genius making it merely appear that there are hands, then, perhaps the Academic Skeptic could legitimately require that *S* eliminate that possibility prior to being justified in believing that there are hands.

Put another way: The Epistemist can claim that the range of relevant alternatives is bounded by those propositions for which there is some, even minimal, evidence. The Epistemist will claim that it is a context-invariant feature of knowledge attributions that the relevant evidence does not include the denial of contraries for which there is no evidence whatsoever. The issue seems to be whether our ordinary knowledge claims are true -- not whether they *would* be true in some context with requirements more stringent that those ordinarily applied.

7. Pyrrhonism

As mentioned at the beginning of this essay, what distinguishes Pyrrhonian Skepticism from Academic Skepticism is that the former does not deny that we can have knowledge of what I have called EI-type propositions. They also would not assent to the Epistemist's claim that we can have such knowledge. Let us see how they arrived at that position.

To deny something is merely to assent to its negation. Since the Pyrrhonians took assent, i.e., the pro-attitude required for knowledge, to involve a kind of certainty that the matter had been finally and fully resolved, they did not assent to what they took to be non-evident propositions.

In distinguishing Pyrrhonism from the Academic Skeptics (in particular, Carneades and Cleitomachus), Sextus writes in *Outlines of Pyrrhonism*, [***PH***]:

> … although both the Academics and the [Pyrrhonian] Skeptics say that they believe some things, yet here too the difference between the two philosophies is quite plain. For the word "believe" has different meanings; it means not to resist but simply to follow without any

> strong impulse or inclination, as the boy is said to believe his tutor; but sometimes it means to assent to a thing of deliberate choice and with a kind of sympathy due to strong desire, as when the incontinent man believes him who approves of an extravagant mode of life. Since, therefore, Carneades and Cleitomachus declare that a strong inclination accompanies their credence … while we say that our belief is a matter of simply yielding without any consent, here too there must be difference between us and them. (***PH*** I:230)

So, the Pyrrhonians would not assent to non-evident propositions. Of course, a crucial issue concerns the scope of the non-evident. To try to resolve that is beyond the scope of this essay (but see Burnyeat & Frede 1997). For our discussion we can suppose that a sufficient condition for some proposition being non-evident obtains whenever there can legitimately be disagreement about it. And, taking the cue from our discussion of Academic Skepticism, I think we can also safely stipulate that there can be legitimate disagreement about some proposition if there is some evidence for it and some evidence against it. So, the question is whether the proposition *S can have knowledge of EI-type propositions* can be the subject of legitimate disagreement.

Putting the matter that way seems to make the answer obvious. There are arguments for Academic Skepticism which have some plausibility, and some plausible objections to those arguments that support the Epistemist's view. Plausible arguments for something constitute some evidence for it. So, we can safely conjecture that it is not evident that we can have knowledge of EI-type propositions and it is not evident that such propositions necessarily fall outside our cognizance. Thus, the primary question then becomes this: What prompted the Pyrrhonian to withhold assent to all non-evident propositions?

The answer is that they found over and over again that neither experience nor reason was able to settle disputes about the non-evident. But the Pyrrhonians did not eschew what they called "appearances" or reasoning. Quite the contrary, the Greek for "skeptic" is closely related to the verb "*sképtomai*" which means "to inquire." Thus, calling oneself a Pyrrhonian Skeptic did not imply a disregard for inquiry or reasoning. Indeed, the modes, to be discussed later, were not designed to inhibit reasoning. Rather, they were designed to assist the Pyrrhonian in continuing to inquire by shielding her from the disquieting state of dogmatism.

Pyrrhonian skepticism was thus a way of life without assent. As such, it has been ridiculed. The Pyrrhonian was likened to someone with Alzheimer's -- surviving only if someone else were around to save him from all sorts of perils: falling into pits, being attacked by a dog or run over by a chariot. That caricature seems to miss the point that the Pyrrhonian only withheld assent with regard to the non-evident propositions.[20] Assent to what was evident (i.e., what appears to be) or a weaker pro-attitude toward the non-evident were commonplace.

As mentioned above, the Pyrrhonians would practice what they called the "modes" in order to try to assure that they were not "perturbed" by assenting. Like piano exercises for the fingers that would result in semi-automatic responses to the printed notes on a sheet of music, the modes were mental exercises that would result in semi-automatic responses to claims being made by the dogmatists -- those who

assented to the non-evident.

The Pyrrhonians believed that (but would not have assented to the claim that) there were two potential sources of knowledge: perception and reasoning. When the results of perception were introduced to settle a non-evident matter -- say the *actual* color of an object (as opposed to how it appeared to someone), they would point out some or all of the following (Sextus Empiricus, ***PH*** I:40-128):

1. Members of *different* species of animals probably perceive colors quite differently because their eyes are constructed differently.
2. Members of the *same* species would have different perceptions of the color depending upon such things as the condition of their eyes, the nature of the medium of perception (varying light conditions for example), and the order in which objects were perceived.

Being reminded of the relativity of perception could incline a person to refrain from assenting to judgements of perception, when those judgements were about the "real" properties of the objects. As Sextus wrote:

> … When we question whether the underlying object is such as it appears, we grant the fact that it appears, and our doubt does not concern the appearance itself, but the account given of the appearance. (***PH*** I:19-20)

Now, perhaps a careful analysis of what is meant by "real" properties coupled with a Cartesian-like answer to some of the doubts raised earlier in the *Meditations* would suffice to respond to the Pyrrhonian concerning the relativity of our senses. For example, if we took the "real" color of objects to be that property (or state) of the object, whatever it is, that produces perceptions of a certain sort in humans under "normal" circumstances and if we could distinguish (as Descartes suggested) normal from abnormal circumstances, then we might have a basis for resisting the Pyrrhonian modes concerning perception. But be that as it may, whether we can have knowledge of EI-type propositions is not a matter that is potentially resolvable by direct appeal to our senses. It will only be resolved if either the Epistemist or the Academic Skeptic has a compelling argument. Thus, the issue here is whether reasoning can settle matters. The Pyrrhonians thought that there were modes which could induce withholding assent to the results of reasoning. It is to those modes that we should turn.

Perhaps the most influential passage in the corpus of the Pyrrhonian literature is a section from ***PH*** entitled "Five Modes of Agrippa." Although the chapter title mentions five modes, two of them repeat those found elsewhere and are similar to the ones just discussed concerning perception. They are the modes of discrepancy and relativity and are important because they provide the background for understanding the description of the three modes concerning reasoning. Specifically, it is presumed that the relevant object of inquiry is subject to legitimate dispute and that reasoning is employed to resolve the dispute. The issue before us then is whether reasoning can legitimately lead to assent. Sextus writes:

> The Mode based upon regress *ad infinitum* is that whereby we assert that the thing adduced

> as a proof of the matter proposed needs a further proof, and this again another, and so on *ad infinitum*, so that the consequence is suspension [of assent], as we possess no starting-point for our argument … We have the Mode based upon hypothesis when the Dogmatists, being forced to recede *ad infinitum*, take as their starting-point something which they do not establish but claim to assume as granted simply and without demonstration. The Mode of circular reasoning is the form used when the proof itself which ought to establish the matter of inquiry requires confirmation derived from the matter; in this case, being unable to assume either in order to establish the other, we suspend judgement about both. (***PH*** I:166-169)

The question is this: Supposing that the dogmatist assents to something, say *p*, on the basis of a reason, say *q*, and gives *r* as his reason for *q*, etc., how should the Pyrrhonian react in order to avoid the snares of dogmatism? The suggestion in this passage appears to be to force the dogmatist into either an apparently never ending regress or an arbitrary assertion or begging the question.

This strategy seems to be based upon the claim that there are (only) three possible patterns which any instance of reasoning can take. I will call the first pattern "infinitism." Today we commonly refer to the second account as "foundationalism." Finally, I will refer to the third possibility as "coherentism."

The so-called "regress problem," can be stated briefly in this way: There are only three possible patterns of reasoning. Either the process of producing reasons stops at a purported foundational proposition or it doesn't. If it does, then the reasoner is employing a foundationalist pattern. If it doesn't, then either the reasoning is circular, or it is infinite and non-repeating. There are no other significant possibilities.[21] Thus, if none of these forms of reasoning can properly lead to assent, then no form can.

So, we must look briefly at the reasons that a Pyrrhonian might have for thinking that foundationalism, coherentism and infinitism are inherently incapable of providing an adequate basis for assent.[22]

8. The Mode to Respond to the Foundationalist

The Pyrrhonian is not (and cannot consistently be) assenting to the claim that foundationalism is false. Rather, a Pyrrhonian employing this mode would be attempting to reassure herself (and perhaps show the Epistemist) that the so-called foundational proposition stands in need of further support. In other words, the Pyrrhonian believes that a foundationalist cannot rationally practice his foundationalism because it inevitably leads to arbitrariness -- i. e., assenting to a proposition which can legitimately be questioned but is, nevertheless, assented to without rational support.

So, how could the Pyrrhonian proceed? To begin to answer that question it is important to note that foundationalism comes in many forms. But all forms hold that the set of propositions can be partitioned into basic and non-basic propositions. *Basic propositions* have some autonomous bit of warrant that does not depend (at all) upon the warrant of any other proposition.[23] *Non-basic* propositions depend (directly

or indirectly) upon basic propositions for all of their warrant.

Suppose that an inquirer, say Fred D'Foundationalist, has given some reasons for his beliefs. Fred offers *q* (where *q* could be a conjunction) for his belief that *p*, and he offers *r* (which could also be a conjunction) as his reason for *q*. Etc. Now, being a foundationalist, Fred finally offers some basic proposition, say *b*, as his reason for the immediately preceding belief. Sally D'Pyrrhonian asks Fred why he believes that *b* is true. Sally adds the "is true" to make clear to Fred that she is not asking what causes Fred to believe that *b*. She wants to know why Fred thinks that *b* is true. Now, Fred could respond by giving some reason for thinking that *b* is true even if *b* is basic, because basic propositions could have some non-autonomous warrant that depends upon the warrant of other propositions. But that is merely a delaying tactic since Fred is not a coherentist. In other words, he might be able to appeal to the conjunction of some other basic propositions and the non-basic propositions that they warrant as a reason for thinking that *b* is true. But Sally D'Pyrrhonian will ask whether he has any reason that does not appeal to another member in the set of basic propositions for thinking that each member in the set is true. If he says that he has none, then he has forfeited his foundationalism because he is really a closet coherentist. Being true to his foundationalism, he must think that there is some warrant that each basic proposition has that does not depend upon the warrant possessed by any other proposition.

The crucial point to note here is that Sally can grant that the proposition has autonomous warrant but continue to press the issue because she can ask Fred whether the possession of autonomous warrant is at all truth conducive. That is, she can ask whether a proposition with autonomous warrant is, *ipso facto*, at all likely to be true. If Fred says "yes," then the regress will have continued. For he has this reason for thinking that *b* is true: "*b* has autonomous warrant and propositions with autonomous warrant are somewhat likely to be true." If he says "no" then Sally can point out that he is being arbitrary since she has asked why he thinks b is true and he has not been able to provide an answer.

Let us look at an example. Often it is held that first-person introspective reports are basic because they have some "privileged" status. My basic reason for thinking that there is an "external" object of a certain sort is that I am having an experience of a certain sort. Now, what Sally should ask is this: "Why do you think you are having an experience of that sort? Or, again to emphasize that she is not asking for an explanation of the etiology of Fred's belief that he is having an experience of that sort, she could ask: "Why do you think that the proposition 'I am having an experience of a certain sort' is true?"

The dilemma is that either Fred has a reason for thinking that proposition is true or he doesn't. If he does, then the regress has not stopped -- *in practice*. If he doesn't, then he is being arbitrary -- *in practice*.

Once again, it is crucial to recall that Pyrrhonians are *not* claiming that foundationalism is false. They could grant that some propositions do have autonomous warrant which is truth-conducive and that all other propositions depend for some of their warrant upon those basic propositions. What lies at the heart of their view is that there is a deep irrationality in being a practicing self-conscious foundationalist. The question to Fred can be put this way: On the assumption that you cannot appeal to any other proposition, do you have any reason for thinking that *b* is true? Fred not only won't have any such reason for thinking *b* is true, given that assumption, he *cannot* have one (if he remains true to his foundationalism).

Arbitrariness seems inevitable. Of course, foundationalists typically realize this and, in order to avoid arbitrariness, tell some story (for example, about privileged access) that, if true, would provide a reason for thinking basic propositions are at least somewhat likely to be true. But then, the regress of reasons has continued.

9. The Mode to Respond to the Coherentist

At its base, coherentism holds that there are no propositions with autonomous warrant. But it is important to note that coherentism comes in two forms. What I choose to call the "warrant-transfer form" responds to the regress problem by suggesting that the propositions are arranged in a circle and that warrant is transferred within the circle -- just as basketball players standing in a circle pass the ball from one player to another. (See Sosa 1980, and BonJour 1978.) I could, for example, reason that it rained last night by calling forth my belief that there is water on the grass and I could reason that there is water (as opposed to some other liquid, say glycerin, that looks like water) on the grass by calling forth my belief that it rained last night.

Long ago, Aristotle pointed out that this process of reasoning could not resolve matters. As he put it: This is a "simple way of proving anything" (*Posterior Analytics*, I, iii, 73a5). The propositions in the circle might be mutually probability enhancing, but the point is that we could just as well have circular reasoning to the conclusion that it did not rain last night because the liquid is not water and the liquid is not water because it did not rain last night. In this fashion anything could be justified -- too simply! It is ultimately arbitrary which set of mutually probability enhancing propositions we believe because there is no basis for preferring one over the other.

The warrant-transfer coherentist could reply to this objection by claiming that there is some property, *P*, in one of the two competing circles that is not present in the other and the presence of that property makes the propositions in one and only one of the circles worthy of assent. For example, in one and only one of the circles are there propositions that we actually believe, or perhaps believe spontaneously.[24] But, then, it seems clear that the warrant-transfer coherentist has adopted a form of foundationalism since he is now claiming that all and only the propositions in circles with *P* have some autonomous bit of warrant. And, all that we have said about the dilemma facing the foundationalist transfers immediately. Is the possession of *P* truth conducive or not? If it is … You can see how that would go.

So much for the warrant-transfer version of coherentism. The second form of coherentism, what we can call the "warrant-emergent form" does not imagine the circle as consisting of propositions that transfer their warrant from one proposition to another. Rather warrant for each proposition in the circle obtains because it is a member of a set of mutually probability enhancing propositions. Coherence itself is the property in virtue of which each member of the set of propositions has warrant. Warrant emerges all at once, so to speak, from the web-like structure of the set of propositions. The coherentist can then argue that the fact that the propositions cohere provides each of them with some *prima facie* credibility.

This might initially seem to be a more plausible view since it avoids the circularity charge. But, aside

from the problem that are too many competing circles that are coherent, the coherentist has, once again, embraced foundationalism. The coherentist is now explicitly assigning some initial positive warrant to all of the individual propositions in a set of coherent propositions that does not depend upon the warrant of any other proposition in the set. In other words, he is assigning to them what we have called the autonomous bit of warrant and, once again, the dilemma facing the foundationalist returns.

10. The Mode to Respond to the Infinitist

The third mode is designed to provide the Pyrrhonian with a way of responding to a dogmatist who assents to some EI-type proposition, *x*, and ceaselessly provides new answers to the question "What reason do you have for *x*?" Since there is always another reason, one that has not already been employed, that needs to be given for any offered reason, assenting to x would be inappropriate. Since the Pyrrhonian (or the Epistemist) does not know either whether there is such an infinite set of reasons available or whether there is no such set available, withholding assent to the proposition that knowledge of EI-type propositions is possible seems appropriate.

For those reasons, infinitism (as far as I can tell) has never been seriously considered as a model of reasoning suitable for the dogmatist because it is obvious that it cannot provide a model of reasoning that could lead to assent. A disputed proposition could never be fully justified for whenever a reason is provided the infinitist is committed to thinking that in order to settle the matter another, as yet "unused," reason must be provided. Since that process can never be completed, infinitism cannot provide the dogmatist with a model that will settle matters.[25]

11. The Overall Effect of the Modes

It appears that the Pyrrhonian has a viable strategy for resisting dogmatism because no process of reasoning is such that assent -- that is, holding that the matter in question has been settled -- is the appropriate attitude to have toward any non-evident proposition.

Stanford Encyclopedia of Philosophy
Notes to Skepticism

Notes

1. For an interesting discussion of rejecting or neutralizing the skeptic's objections, see Lehrer 2000, 131-136.

2. Wittgenstein 1969. In paragraph 519, he writes:

> Doubt itself rests only on what is beyond doubt. . . But since a language-game is something that consists in the recurrent procedures of the game in time, it seems impossible to say in any *individual* case that such-and-such must be beyond doubt if there is to be a language-game -- though it is right enough to say that *as a rule* some empirical judgment or other must be beyond doubt.

3. Peter Unger's view is an exception. He directs the attack on the psychological condition which he takes to be required for knowledge, namely certainty. He thinks very little, if anything, is such that we are certain of it since "certainty" is an absolute term. Further, he claims that since "certainty" is an absolute term, if we are more (nearly) certain of *x* than we are of *y*, *y* cannot be something about which we are certain. And virtually everything is such that we are more (nearly) certain of something else. See Unger 1975.

4. There is no term readily available. A natural one would be "cognitivist" but that term already has a very specific application in ethics. "Cognitist" just strikes my ears as cacophonic.

5. Sextus Empiricus, *Outlines of Pyrrhonism*, I:226. Also see his discussion of Carneades in *Against the Logicians*, I:159-190. The "logicians" were considered to be dogmatists by Sextus. (In fact, the essays against the logicians were part of his larger work called "Against the Dogmatists." See the preface by Bury, *ibid.*, vii.)

6. Indeed, Keith Lehrer 1997 seems to be giving that response.

7. For a contrasting discussion of the realm of the doubtful, see Stroud 1984, Chapter 1.

8. In the "First Meditation," Descartes does not suggest a potential ground for doubt that he rejects unless, perhaps, that he is mad (insane). He asks whether he could be mad and like people who imagine that they are kings when they are in reality poor, that they are clothed when they are naked or that they

are pumpkins or made of glass. His answer is "But they are mad, and I should not be any the less insane were I to follow examples so extravagant" (*ibid*., 145). That is a puzzling response. Is the evil genius hypothesis less "extravagant?" Or from his point of view, is the possibility that his creator was something other than a perfect god any less extravagant? Nevertheless, he at least seems to be giving reasons for rejecting that grounds for doubt. Of course, later in the *Meditations* he rejects the claim that his maker might have been less than perfect.

9. Strictly speaking, condition (1) entails (3), and hence, (3) is not needed. For if *S* did have a way of neutralizing the effect of *d*, then adding *d* to *S*'s beliefs would not have the effect of making assenting to *p* no longer adequately justified. (That is, ~(3) entails ~(1).) I chose to include (3) to make clear the distinction between denying the potential ground for doubt and neutralizing it.

10. See, for example, DeRose and Warfield 1999. In that volume most of the authors take the CP-style argument to be the primary one. There is an excellent discussion of Academic Skepticism in the Introduction to that volume.

11. For the sake of clarity, it is important to point out that the restoring proposition could itself have a genuine ground for doubt, so that even if (*r* & *d*) did not reduce the warrant for *x*, [(*r* & *d*) & d_1] could defeat the justification for *x* since d_1 would defeat the restoring effect of *r*. But then, (*d* & d_1) would be a new grounds for doubt. So, we need not include this epicycle.

12. Two propositions, *x*, *y* are contraries just in case *x* entails ~*y*, but ~*x* does not entail *y*. Here are some examples: The ball is red all over, the ball is yellow all over; *X* is an aunt, *X* is an uncle. More to the point, *h* and *sk* are contraries since *h* entails ~*sk*, but ~*h* does not entail *sk*. For example, it could be the case that there is no hand before me and I am not in a switched-world (or it doesn't appear that there is a hand before me).

13. The probability could be either subjective or objective. The reason for including "non-overridden" in the supposition is that it would not be sufficient for *S* to be entitled to believe something if *S* only had good enough grounds to render a proposition sufficiently likely to be true because *S* might also have counter evidence that overrides those positive grounds.

14. For another, similar, proposed counterexample, see Audi 1988, 77.

15. For the sake of employing consistent terminology, I have changed "*P*" to "*p*" and "*Q*" to "*q*."

16. For a full discussion of Nozick's account of knowledge, see Luper-Foy 1987.

17. It is crucial to note that the truth of CP does not depend upon the antecedent being fulfilled.

18. The claim here is not that the evidential relationship between *h* and ~*sk* is such that *S must* use Pattern 2. The claim is merely that such a path is available.

19. Much of the material in this section recapitulates Klein 2000a.

20. The caricature is mentioned by Diogenes Laertius, but is also somewhat mitigated by pointing out that the suspension of assent was only "his philosophy" and that Pyrrho lived to be nearly ninety. Here is what he says:

> He [Pyrrho] led a life consistent with his doctrine, going out of his way for nothing, taking no precaution, but facing all risks as they came, whether carts, precipices, dogs or what not, and, generally leaving nothing to the arbitrament of the senses; but he was kept out of harm's way by his friends who . . . used to follow close after him. But Aenesidemus says that it was only his philosophy that was based upon suspension of judgement, and that he did not lack foresight in his everyday acts. He lived to be nearly ninety. (Diogenes Laertius, *Lives of Eminent Philosophers*, Bk IX, 62)

21. Strictly speaking, there is a fourth possibility, namely that there are foundational propositions *and* that there are an infinite number of propositions between a foundational proposition and the one for which reasons are initially being sought. Interestingly, such a hybrid view might be indistinguishable in practice from infinitism and, hence, I think for our purposes we can treat this as a form of infinitism.

22. These are my own glosses on what I take to be the best arguments. I do not claim that the Pyrrhonians gave these very arguments.

23. I put it that way in order to make clear that foundationalism can embrace some aspects of coherentism. Basic propositions with only minimal justification, if coherent, can gain additional credibility. Thus, this account of foundationalism includes both weak and strong foundationalism as characterized in BonJour 1978.

24. This is the suggestion put forward in BonJour 1985.

25. I should note that nothing said here implies that infinitism is an inappropriate model for reasoning that is not meant to result in assent. For a defense of infinitism, see Klein 1999, 2000b, and 2002b.

Ancient Skepticism

Used in its most specific sense, the expression "ancient skepticism" refers to two movements in ancient philosophy. One is Pyrrhonism, which claims Pyrrho of Elis (4th-3rd c. B.C.) as its founder but was especially prominent during and after the 1st c. B.C. The other is Academic Skepticism, which encompasses a skeptical phase in the history of Plato's Academy (3rd to early 1st c. B.C.).

Used more broadly and more loosely, the term "skepticism" is sometimes used in conjunction with a great many ancient thinkers who are not tied to these two movements, but are characterized by significant skeptical inclinations. The most important of these are Protagoras and Socrates, but one might also include Gorgias, Democritus, Aristippus and Diogenes of Sinope (the "Cynic"). While the views of these figures are sometimes mentioned in the present article, it focuses on the narrow notion of "ancient skepticism" and the figures and schools that it encompasses.

An Overview

Following Sextus Empiricus, we can say that the ancient "skeptic" (from a Greek verb meaning "to examine carefully") was an "investigator." He was someone who investigated the questions of philosophy

but "suspended judgment" because he was unable to resolve the contrary attitudes, opinions and arguments that characterized the debated topics of philosophy, hence unable to arrive at a definitive position of his own on any of them. Instead of adhering to some standard philosophical position, the skeptic therefore described himself as someone who continues to investigate -- a "zetetic."

Sextus (end 2nd c. A.D.) describes Pyrrhonian skepticism's relationship to other ancient philosophies in the opening passage of his *Outlines of Pyrrhonism* (*PH*).

> When people search for something, the likely outcome is that either they find it or, not finding it, they accept that it cannot be found, or they continue to search. So also in the case of what is sought in philosophy, I think, some people have claimed to have found the truth, others have asserted that it cannot be apprehended, and others are still searching. Those who think that they have found it are the Dogmatists, properly so called -- for example, the followers of Aristotle and Epicurus, the Stoics, and certain others. The followers of Clitomachus and Carneades, as well as other Academics, have asserted that it cannot be apprehended. The Skeptics [*skeptikoi*] continue to search [i.e., investigate]. (*PH* 1.1-3, Mates)

Two aspects of these remarks warrant special comment. One is Sextus' suggestion that the Pyrrhonian leaves open the possibility of apprehending truth. While consistency forces him to speak this way -- for continuing to investigate makes no sense unless it might conceivably lead to the discovery of some definitive solution to the problems investigated -- one might reasonably wonder whether the ancient skeptic was genuinely open to this possibility. Certainly it must be said that the Pyrrhonian stance one finds in Sextus is an overwhelmingly negative one which functions primarily as a negative critique of any attempt to establish truth.

Sextus' comments on Carneades, Clitomachus and other Academic skeptics are also controversial. His suggestion that they maintain that truth cannot be apprehended (which might imply that they inconsistently maintain they have apprehended that this is true) is most plausibly interpreted as an attempt to drive a wedge between Pyrrhonism and what at Sextus' time was recognized as a competing school of skepticism. In the present context, it is enough to say that these Academics would be skeptics in the sense in which we use the term even if they did adopt the negative dogmatism which Sextus ascribes to them, for it still constitutes a comprehensive rejection of any claim to have apprehended what is true.

The conviction (or deep-seated suspicion) that philosophical claims to apprehend some truth are inherently uncertain is, therefore, the heart of ancient skepticism. The ancient skeptics propounded and defended this conviction by opposing any and all positions with contrary positions, each of which is said to demonstrate the other's uncertainty. Sextus describes the "method of antithesis" this implies when he explains later Pyrrhonism's practice of *epoche* (suspending judgment):

> Broadly speaking, this [suspension of judgement about all things] comes about because of the setting of things in opposition. We oppose either appearances to appearances, or ideas to ideas, or appearances to ideas. We oppose appearances to appearances when we say "The

> same tower seems round from a distance but square from near by." We oppose ideas to ideas when someone establishes the existence of providence from the orderliness of the things in the heavens and we oppose to this the frequency with which the good fare badly and the bad prosper, thereby deducing the non-existence of providence. We oppose ideas to appearances in the way in which Anaxagoras opposed to snow's being white the consideration: snow is water, and water is black, therefore snow is black too. On a different scheme, we oppose sometimes present things to present things, but sometimes present things to past and future things... (*PH* 1.31-5, Long & Sedley)

Diogenes Laertius (1st half of 3rd c. A.D.) associates a similar method of antithesis with Academic skepticism when he writes that Arcesilaus (mid-3rd c. B.C.) "was the originator of the Middle Academy, being the first to suspend his assertions owing to the contrarieties of arguments, and the first to argue pro and contra" (4.28-44, Long & Sedley). The most famous of the Academic skeptics, Carneades (mid-2nd c. B.C.), is reported to have demonstrated his ability to argue for opposing views on a famous trip to Rome, where he is said to have argued impressively for justice on one day and on the next to have argued with equal force against it (Lactantius, *Div. Ins.*, 5.16, 6.6). Judging by Cicero's account in *De Finibus*, the attitude of opposition which this reflects played an integral role in lessons in the skeptical Academy, where the teacher proceeded by opposing a thesis enunciated by a student (e.g., "The Chief Good in my opinion is pleasure"). In a more technical way, antithesis is evident in the Academics' argument against the Stoics' "cataleptic" impressions, which paired alleged examples of such impressions with equally forceful, but indistinguishable impressions which are false.

We might recognize the emphasis on opposition and antithesis which characterized ancient skepticism by describing it as a rejection of our ability to apprehend truth which was founded on the attempt to oppose other philosophies, both by opposing their arguments and positions, and by devising general strategies of opposition.

The Historical Context

It is sometimes said that skeptical doubts characterize times of social upheaval (not only in ancient times but also in the fourteenth century and in contemporary philosophy). Whether these kinds of considerations can help explain the rise of ancient skepticism is very difficult to say, in part because the role which social influences play in determining any philosophical position is inherently complex and obscure. In view of this, it can best be said that ancient skepticism is a natural extension of many of the trends and movements that characterize mainstream ancient philosophy.

Skepticism's affinity to other ancient philosophies is most evident in the kinds of considerations that convince the skeptic that he should suspend judgment on the truth of any philosophical claim. For though skeptical *conclusions* (that on given issues the truth is uncertain) are at odds with the "dogmatist" philosophies the skeptics criticize, these philosophies were frequently founded on a similar concern with opposition, antithesis, and opposing points of view. One might, for example, easily compare the Pyrrhonian conviction that there are equally convincing arguments for and against any claim to the

Protagorean conviction that one can argue convincingly on both sides of any question. This similarity reflects similar philosophical concerns even though Protagoras' conclusion (at least as it is reported by Plato in the *Theaetetus*) that opposing points of view are true is diametrically at odds with the skeptic's rejection of all claims to truth.

The situation is similar in many other cases. Opposing points of view played an important role in the development of Greek atomism, which can be seen as an attempt to explain such opposition by hypothesizing atoms which impact on different kinds of bodies in different kinds of ways. Opposites which include opposing points of view are also emphasized in Heracleitean and Platonic metaphysics. Even Aristotle recognized the possibility of arguing for conflicting points of view in his work on rhetoric.

In other cases, ancient philosophers anticipated skepticism by stressing the difficulties inherent in the search for truth. Xenophanes was known for his claim that no one can know clear truth. Democritus maintained that "bastard" knowledge gained through our senses exists only by convention. Plato rejected everyday opinions, comparing them to shadows in a cave. Diogenes of Sinope, Epictetus and similar moralists dismiss philosophical speculation on the grounds that practical demonstration is what matters. Such philosophers did not endorse a full fledged skepticism, but their views clearly added impetus to the skeptics' moves in this direction.

Much more generally, ancient skepticism flourished in an intellectual climate which was naturally conducive to skeptical conclusions. In marked contrast with modern science, ancient science did not, for example, boast the kinds of practical and theoretical successes we now take for granted. In part because of this, a bewildering array of opposing philosophical perspectives characterized ancient philosophical inquiry and important philosophers were famous for their ability to construct dazzling arguments for paradoxical conclusions (that motion is impossible, that nothing exists, that time is an illusion, etc.). An interest in foreign cultures drew attention to opposing customs and traditions, mysticism and irrationalism flourished as powerful cultural forces, and opposing interests and perspectives were manifest in war, political rivalries and a religion and mythology which pitted god against god, man against man and even god against man. In the midst of the opposing views that this implies, it cannot be judged surprising that radical skepticism in a variety of forms became a prominent philosophical perspective.

Pyrrho and Equanimity

The movements that make up ancient skepticism begin with Pyrrho (ca. 365-ca. 275 B.C.). In marked contrast to modern skeptics, he proposed skepticism as a way of life which functioned as a route to equanimity and contentment. He left no writings, and except for what has survived of his pupil Timon's exegetical writings ancient reports about him are heavily colored by anachronism drawn from the philosophical outlook of the Pyrrhonian "revival" in the 1st c. B.C. (see below, "The Arguments for Later Pyrrhonism"). Sextus is, for example, noticeably reticent when he declares that "Pyrrho appears to us to have applied himself to Skepticism [i.e. Pyrrhonian skepticism as Sextus knew it] more thoroughly and more conspicuously than his predecessors" (*PH*1.7, Bury). We find a less hedged view of Pyrrho and his views in the following fragment of Aristocles (Peripatetic of uncertain date, perhaps 1st c. B.C.-A.D.,

perhaps 2nd c. A.D.).

> He [Pyrrho] himself has left nothing in writing, but this pupil Timon says that whoever wants to be happy must consider these three questions: first, how are things by nature? Secondly, what attitude should we adopt towards them? Thirdly, what will be the outcome for those who have such an attitude? According to Timon, Pyrrho declared that things are equally indifferent, unmeasurable and inarbitrable. For this reason neither our sensations nor our opinions tell us truths or falsehoods. Therefore for this reason we should not put our trust in them one bit, but should be unopinionated, uncommitted and unwavering, saying concerning each individual thing that it no more is than is not, or both is and is not, or neither is nor is not. The outcome for those who actually adopt this attitude, says Timon, will be first speechlessness [*aphasia*], and then freedom from disturbance; and Aenesidemus says pleasure. (Eusebius, *Prep. Ev*. 14.18.2-5, Long & Sedley)

According to Diogenes Laertius (9.76), Timon explained Pyrrho's formula *ou mallon* ("no more is than is not") as a way of expressing a decision to suspend judgment and determine nothing. The practical result of the indifference to opinions and sensations which results is Pyrrho's "peace of mind" (D.L. 9.65).

The *Life of Pyrrho* which Diogenes Laertius includes in his *Lives of Eminent Philosophers* suggests that Pyrrho lived a life in accord with his own emphasis on equanimity and indifference. Among other things, he lived like a recluse, did not "so much as frown" when treated with disinfectants, surgery and cautery, voluntarily adopted a life of piety and poverty, and performed menial tasks to show his indifference. According to one anecdote, he was criticized when he failed to maintain his composure when a cur rushed at him and terrified him (Pyrrho answered that it is difficult to strip oneself of human nature). The citizens of his native Elis rewarded him with honors, making him a high priest, raising a statue in his honor (Pausanias 6.24.5), on his account passing a law which exempted philosophers from taxes (D.L. 9.64).

Flintoff locates the origins of Pyrrho's philosophy in India, where Pyrrho travelled with the court of Alexander the Great and was in this way exposed to Indian ascetics and their commitment to an enlightened state of mind. Certainly it is likely that Pyrrho was impressed with the indifference of India's gymno-sophists (the "Naked Philosophers"). This much being granted, it can still be said that his skepticism has Greek origins which are plausibly located in Democritean atomism.

Looked at from the point of view of earlier Greek philosophy, Pyrrho's skepticism is a natural evolution of Democritus' doubts about ordinary opinions, which Democritus rejected as purely "conventional" on the grounds that they are contradictory and truth resides in atoms and the void. It is in keeping with this that Pyrrho's teacher is the Democritean Anaxarchus (whom he followed to India); his formula *ou mallon* is borrowed from atomism (DeLacy); his goal of equanimity reflects Democritean practical ideals; and he is said to have admired Democritus above all others (D.L. 9.67). But Pyrrho takes skeptical inclinations one step further than Democritus and rejects atomism as well ordinary opinions, in the process giving up on philosophy and on all attempts to establish what is true (D.L. 9.69,65; cf. Sextus, *PH* 1.28-29; *AM* [*Adversus Mathematicos*] 11.1). As Aristocles puts it, "if we are so constituted that we know nothing, then there is no need to continue enquiry into other things.... Pyrrho of Elis was ... a powerful spokesman

of such a position" (Eusebius, 14.18.1-2, Long & Sedley).

Sextus describes Pyrrhonism's ties to equanimity (*ataraxia*) with an anecdote which probably relates events which occurred during Pyrrho's time with Alexander's court. It tells how Apelles, Alexander's court painter, was frustrated by his inability to paint the froth on a horse's mouth and in exasperation threw a sponge at his painting, accidentally producing the effect he wanted. "So, too, the Skeptics were hoping to achieve *ataraxia* by resolving the anomaly of phenomena and noumena, and, being unable to do this, they suspended judgment. But then, by chance as it were, when they were suspending judgment the *ataraxia* followed, as a shadow follows the body." (*PH* 1.29, Mates)

Apparently, equanimity accompanies skepticism "like a shadow" for two reasons. First, because it eliminates the anxiety that accompanied the study of philosophy in the hope of arriving at an apprehension of the truth about reality and what is good and bad in human life. Second, it promotes indifference to the misfortunes and calamities that disturb our peace of mind, for the skeptic concludes that misfortunes and calamities can't be known to be bad. In the context of his actual life, Pyrrho probably maintained his attitude of calm composure by using the method of antithesis outlined in the following fragment of Democritus:

> [In order to achieve cheerfulness]... one must keep one's mind on what is attainable, and be content with what one has, paying little heed to things envied and admired, and not dwelling on them in one's mind. Rather must you consider the lives of those in distress, reflecting on their intense sufferings, in order that your own possessions and condition may seem great and enviable, and you may, by ceasing to desire more, cease to suffer in your soul... One must... [compare] one's own life with that of those in worse cases, and must consider oneself fortunate, reflecting on their sufferings, on being so much better off than they. If you keep to this way of thinking, you will live more serenely (fr. 191, cf. fr. 3; Kirk, Raven and Schofield).

The exercises here proposed allow one to be content by continually opposing one's misfortunes with comparisons that make one seem well off. The relativity of value judgments -- a natural component of skepticism -- can in this way provide a psychological basis for peace of mind. As the old saw goes, "I was upset about my lack of shoes until I met a man with no feet."

Pyrrho's own use of such tactics is implied by the report that he was fond of Homer's lines (*Il.* 21.106-7): "Ay friend, die thou; why thus thy fate deplore? Patroclus, thy better, is no more" -- lines that combat upset with one's own fate with the thought that one does not deserve anything better, since the great warrior Patroclus has suffered the same. Oppositions of this sort are probably implied when it is said that Pyrrho "talked to himself" when he trained himself to be good (D.L. 9.64, cf. 69). The same method and ideals are reflected in an incident in which his teacher Anaxarchus cures Alexander's despondency after he has killed a friend (Plutarch, *Alex.*, 52), and in Anaxarchus' own fame as "the happy one," which is in part founded on (or perhaps the basis for) the story that he was unflappable even when he sufferred a horrible death at the hands of the tyrant Nicocreon (D.L. 9.59-60).

Appearances

Pyrrho's philosophy raises a number of issues which reverbate throughout the history of skepticism. Questions about the consistency of the skeptical perspective are particularly significant. As Aristocles says, "in admonishing us to have no opinion, they [the skeptics] at the same time bid us to form an opinion, and in saying that men ought to make no statement they make a statement themselves: and though they require you to agree with no one, they command you to believe themselves..." (Eus. *Prep. Ev*. 14.18, Gifford).

Other commentators ask how Pyrrho survived the pitfalls of day to day life -- much less achieved supreme contentment -- if he refused to believe the truth of his sense impressions. According to one ancient report, this was a practical as well as a theoretical issue, for Pyrrho accepted skepticism "in his actual way of life, avoiding nothing and taking no precautions, facing everything as it came, wagons, precipices, dogs, and entrusting nothing whatsoever to his sensations. But he was looked after... by his disciples, who accompanied him" (D.L. 9.62, Long & Sedley).

Though the consistency of skepticism is open to debate, not much is to be made of this account of Pyrrho's actions, which can be grouped with many other unbelievable stories which Diogenes Laertius reports -- that Pythagoras descended into Hades, that Apollo appeared to Plato's father, that Zeno of Elea (and, again, Aristarchus) bit off his tongue and spat it at a tyrant who was persecuting him, and so on. Laertius has a penchant for such stories and is happy to stretch himself to include them -- in this case he does so by citing as his authority "those around" Antigonus of Carystus (3rd c. B.C. author of *Lives of Philosophers*), making this account of Pyrrho little more than a rumor.

As Hallie says, we can usefully contrast the claim that Pyrrho rejected the senses with Posidonius' account (1st c. B.C.) of his actions when he was caught in a wild storm at sea (D.L. 9.68). Confronted with other passengers wailing and cringing with horror, Pyrrho is said to have remained calm and pointed to a small pig which was calmly eating on the deck, saying that its attitude demonstrated the unperturbed state of the wise man. Even though Timon included "sensations" as well as "opinions" within the scope of Pyrrho's skepticism, this suggests that it is human fears and frailties, not sense impressions, which Pyrrho was concerned to expunge by skeptical inquiry.

It can still be asked how Pyrrho could consistently embrace his senses and his skeptical conclusions. Timon answers that the Pyrrhonian guides himself by "appearances" (*phainomena* -- what "appears to be the case"). This suggests that Pyrrho rejected claims to truth and viewed his skepticism and his day to day beliefs as a mere acceptance of appearances that stops short of claims to truth. As Diogenes Laertius puts it:

> ...the dogmatists say that they [the skeptics] abolish life, in the sense that they throw out everything that goes to make up a life. But the skeptics say that these charges are false. For they do not abolish, say, sight, but only hold that we are ignorant of its explanation.... We do sense that fire burns, but we suspend judgement as to whether it is fire's nature to burn....

> "We only object," they say, "to the non-evident things added on to the phenomena [the appearances].... For this reason, Timon in his *Pytho* says that he has not diverged from what is customary. And in his *Likenesses* he says, "But the apparent utterly dominates wherever it goes." And in his work *On the Senses* he says, "That honey is sweet I do not posit; that it appears so I concede." (D.L. 9.104-5, Inwood & Gerson)

Such claims suggest that we should interpret early Pyrrhonian claims -- and even Pyrrho's claim that things "are" indifferent, unmeasurable and inarbitrable -- as claims about what appears to be the case. Whether such moves can, in the end, save the skeptic from the charge of inconsistency is a matter of much debate (for two sides of this debate, see Frede and Burnyeat).

Arcesilaus in the Academy

Pyrrho's impact on his immediate contemporaries seems quite limited. Timon is his only student of repute and ancient skepticism's next phase is not Pyrrhonian but Academic. No doubt the Academy became a school of skepticism by exploiting the skeptical aspects of Plato's philosophical writings -- Socrates' heroic skepticism in the early dialogues; the questioning of the forms in the *Parmenides*; Plato's pessimism about "ordinary" knowledge; and the indeterminate nature of his dialogues which are intrinsically open to many interpretations. Cicero, who defends a late version of Academic skepticism, says Plato is a skeptic because he is always arguing pro and contra, states nothing positively, inquires into everything, and makes no certain statements (*Ac* 1.46).

The first of the Academic skeptics is Arcesilaus (316/315-242/241 B.C.), the head of what Diogenes Laertius calls the "Middle" Academy. He was influenced by Plato, Pyrrho and Diodorus Cronus (a dialectician of impressive skill). Ariston (3rd c. Stoic philosopher) described him as "Plato in front, Pyrrho behind, Diodorus in the middle" (D.L. 4.33). According to Sextus, his skepticism is "virtually identical" with Pyrrhonism (*PH* 1.232). While Arcesilaus was no ascetic (see, e.g., D.L. 4.37-42), he still held that skepticism aims at happiness (*AM* 7.158) and some of the anecdotes we find in Plutarch suggest that he, like Pyrrho, believed we should deal with misfortune and unhappiness by finding opposing ways of looking at trying situations (see "On Controlling Anger," 461E and "On Tranquillity of Mind," 470A-B).

Arcesilaus' arguments focus primarily on Stoic epistemology. According to Couissin, he has no views of his own on the epistemological topics he disputes with the Stoics, and offers his arguments merely as a reductio ad absurdum of the Stoic point of view. It is difficult (perhaps impossible) to judge whether this is so in the context of scanty evidence almost 2000 years later, especially as it is never easy to tell how a philosopher intends a particular argument or position (Caton has even argued that Descartes is not committed to the *cogito* in the *Meditations*).

However one interprets it, the crux of Arcesilaus' attack on Stoic epistemology is his attack on the "cataleptic" impression (the *kataleptike phantasia*). According to the Stoics, such an impression is clear and distinct and -- in virtue of its clearness and distinctness -- reveals certain truth. As such, it becomes

the criterion or foundational guarantee of truth. According to Arcesilaus, there is no such impression (and no impression can be a guarantee of truth), for any allegedly cataleptic impression can be paired with an impression which is equally clear and distinct but nonetheless mistaken -- because it is experienced in dreaming, hallucinating, etc. (*Ac*. 2.77; *AM* 7.252).

According to Sextus, Arcesilaus combines his skeptical arguments with a commitment to "the reasonable" (the *eulogon*) which he propounds as a practical criterion in day to day affairs.

> ... since it was necessary ... to inquire into the conduct of life which naturally cannot be directed without a criterion, upon which happiness too, that is, the goal of life depends for its reliability, Arcesilaus says that he who suspends judgment about everything regulates choices and avoidances and, generally, actions by reasonableness, and, proceeding according to this criterion, will act correctly. For happiness arises because of prudence, and prudence resides in correct actions, and a correct action is that which, having been done, has a reasonable defence. Therefore, he who adheres to reasonableness will act correctly and will be happy. (*AM* 7.158, Inwood & Gerson)

Those who, like Couissin, see Arcesilaus as a purely negative dialectician do not believe that he actually endorsed such views, at any rate not on the basis of an independent examination of the issues (as against what would reasonably follow from Stoic assumptions). Sextus, however, does not frame his report of Arcesilaus' views in this way, and seems to claim that the use of the "reasonable" as a criterion of choice was Arcesilaus' own philosophical position, which he proposed as an alternative to a reliance on the Stoics' "cataleptic impression." In any case, some such commitment makes good philosophical sense (see Hankinson, 86-91), especially in a historical context in which philosophy is expected to provide a practical guide to life.

One might, of course, still debate whether Arcesilaus' skepticism was consistent with an acceptance of the "reasonable" or, much more fundamentally, the actions which daily life requires (for one might argue that eating, drinking, moving, etc. require beliefs that skepticism undermines). That this was a heated issue already in ancient times is evident in Plutarch's *Against Colotes* (2nd c. A.D.), which takes Colotes (3rd c. B.C.) to task for his attack on Arcesilaus and other philosophers in a book entitled *On the fact that the doctrines of the other philosophers make it impossible even to live*. Colotes' book also attacked Democritus, Aristotle, Parmenides, and Socrates -- indeed, virtually everyone but his mentor, Epicurus -- so he was not concerned especially with Arcesilaus. But Plutarch includes a notable defense of Arcesilaus in his response. It argues that the soul has three movements: sensation, impulse, and assent, and that Arcesilaus allows us to accept sensation and impulse so long as we stop short of assent and opinion (*Mor*. 1122C-D). According to an angry Plutarch, it follows that Arcesilaus' views in this way provide a basis for action and get from Colotes the kind of unappreciative attention that a performance on the lyre gets from an ass (*Mor*. 1122B).

Carneades in the Academy

After Arcesilaus, the leadership of the Academy passed to Lacydes, to Telecles and Evander, and then to Hegesinus. Little is known about their views, but it seems that they preserved Arcesilaus' skepticism. The next phase in the history of ancient skepticism begins with Carneades (214/213-129/128 B.C.), who Diogenes Laertius describes as the head of the "New" Academy. Though he wrote nothing, he appears to have been a remarkably successful philosopher. So much so that Numenius (2nd c. A.D. Platonist) says, in a fragment in Eusebius (a 3rd-4th c. A.D. Christian bishop), that he was victorious on every issue. According to Diogenes Laertius, he became so famous attacking Stoic arguments that he said, "if Chrysippus had not existed neither would I," mimicking the Stoic maxim, "if Chrysippus had not existed, neither would the Stoa" (D.L. 4.62, cf. 7.183).

One finds an account of two of Carneades' central arguments against the "criterion" of knowledge (including especially the Stoic "cataleptic impression") in Sextus' work, "Against the Logicians" (*AM*7.159-165). According to Sextus' account, they were addressed against all of Carneades' (dogmatic) predecessors. The first maintained that there can be no criterion of certain truth because reason, the senses, and any other supposed criterion can play us false. The second argued that the impressions (or "presentations") that inform our judgments are not purely objective, but reflect also their own subjective nature -- as light shows both itself and the things it illuminates. It appears that the subjectivity of impressions which this second argument emphasizes was underscored by an appeal to the by now standard argument that any impression which appears true can be paired with (and opposed by) an indistinguishably similar impression which is false.

Though Carneades' cleverness in argument (rather than the moral austerity we associate with Pyrrho) is the most notable feature of extant evidence about him, Cicero implies that he used antithesis to promote equanimity when he says that Carneades criticized Chrysippus for approving of a passage in which Euripides recounts the pain of life. According to Carneades, Chrysippus was promoting depression whereas the passage should instead be used to bring comfort to the ill-disposed by reciting the misfortunes of others (*Tusc. Disp.* 3.59-60). A similar concern with equanimity is evident in Carneades' claim that we should oppose the expected with the unexpected -- health with the possibility of sickness, safety with the possibility of accident, etc. -- because the unexpected causes us grief when it catches us off guard (Plutarch, *Tranq.* 474F-75A). In a famous speech Carneades demonstrated how to use opposing arguments as a means of promoting peace of mind by arguing, for the sake of Clitomachus in the wake of the destruction of his native Carthage, that the wise man is not distressed even at the loss of his native city (Cicero, *Tusc. Disp.* 3.54).

Despite his arguments against all criteria of certain truth, Eusebius says that Carneades did not suspend judgment on all matters (*Prep. Ev.* 14.7.15), but distinguished between things that are "non-evident" (non-apparent) and those that are "non-apprehensible." According to this account, he held that everything is non-apprehensible but that some things are not non-evident. It is tempting to compare this alleged commitment to "evident" things with the Pyrrhonian commitment to appearances, but this is difficult given that Carneades (unlike the Pyrrhonians) is said to rank different kinds of impressions as more and less persuasive.

In "Against the Logicians," Sextus, in conjunction with his report of Carneades' attacks on the Stoic

theory of cataleptic impressions, says that Carneades adopted the *pithanon* (the "plausible") as a practical criterion and distinguished between impressions which are: (i) implausible; (ii) plausible (i.e. appear true "to an intense degree"); (iii) irreversible (i.e. plausible and confirmed by other impressions); and (iv) tested (i.e. irreversible and tested by the scrutiny of surrounding circumstances). One might argue that this is an improvement on Stoic epistemology, insofar as it suggests that they should propose as their criterion, not the merely "clear and distinct" impressions, but those that are irreversible, and tested as well. According to Sextus' account of Carneades' views, he added some further sophistication to his criterion of choice by holding that different levels of plausibility are appropriate in different kinds of circumstances. While he proposed plausible impressions as a guide in matters of no importance, for example, he is said to hold that weighty matters call for impressions which are irreversible and tested (*AM* 7.184).

Sextus illustrates Carneadean plausibility with an illuminating example:

> On seeing a coil of rope in an unlighted room a man jumps over it, conceiving it for the moment to be a snake [i.e. judging this to be plausible], but turning back afterwards he inquires into the truth, and on finding it motionless he is already inclined to think that it is not a snake [for this impression seems reversible], but as he reckons, all the same, that snakes too are motionless at times when numbed by winter's frost, he prods at the coiled mass with a stick, and then, after thus testing the impression received, he assents to the fact that it is false to suppose that the body presented to him is a snake. (*AM* 7.187-88, Bury)

Judging by Sextus and some of our other ancient sources, Carneades tried to make the *pithanon* compatible with his skepticism by emphasizing that plausibility is inherently subjective and a criterion of choice but not a measure of objective probability or truth. Clitomachus thus writes that "The Academic school holds that there are dissimilarities between things of such a nature that some of them seem plausible and others the contrary; but this is not an adequate ground for saying that some things can be apprehended [or grasped as true] and others cannot, because many false objects are plausible..." (Cicero *Ac*. 2.103, Rackham, tr. altered; cf. 104 and *AM* 7.169). This makes Carneadean assent to something's plausibility consciously subjective and, in view of this, more constrained than the assent which seems to be implied by claims to truth.

Though Carneades may in this way have avoided claims to truth, his account of plausible and implausible impressions still drives an important wedge between his views and those of the Pyrrhonians, for the Pyrrhonians attempt to accept appearances with a minimum (one might say ascetic) inclination that seems incompatible with the conviction that some of the things assented to are highly plausible. As Sextus puts it, "[A]lthough both the [later] Academics and the Skeptics say that they are persuaded of certain things, here too the difference of the philosophies is very evident. For ‘to be persuaded’ has different senses: on the one hand, it means not to resist but simply to follow without much proclivity or strong pro feeling, as the child is said to be obedient to his teacher; but sometimes it means assent to something by choice and with a kind of sympathy due to strong desire, as when a profligate man is persuaded by one who approves of living extravagantly. Since, therefore, the followers of Carneades and Clitomachus say both that they are strongly persuaded and that things are strongly persuasive [i.e. plausible, *pithanon*], whereas we say

that we simply make a concession without any strong feeling, we would differ from them in this respect, too." (*PH* 1.230, Mates). This difference highlights the much more significant role that ascetic indifference plays in Pyrrhonian -- as opposed to Carneadean -- skepticism.

Carneades as Dialectician

Some commentators on ancient skepticism argue that Carneades did not endorse the positive philosophy implied in the suggestion that we should follow the "plausible" impression, which Sextus seems to ascribe to him. According to this reading, Carneades proposed the plausible merely "for the sake of argument" -- to show that alternatives to dogmatic epistemology as a basis for living an active life are in principle possible (Striker's views in this regard are notable). On this interpretation, Carneades was a dialectician, and a skeptic only in the sense that he never committed himself to any of the premisses from which he argued, or to any of the conclusions he drew from them. It follows that he was not a full fledged skeptic, in the sense of one who believed that no certain knowledge was possible, or who (given that) advocated a skeptical way of life in dependence on mere "belief" in "plausible" ("irreversible," or "tested") impressions. On this view his achievement was not a skeptical philosophy but a dialectical ability to argue for (and primarily against) any point of view.

The issue is a thorny one, as any philosopher is likely to act as a dialectician at some time or other, and dialectical argument is an integral part of ordinary skepticism, which continually propounds particular points of view "for the sake of argument." Sextus is a case in point, for he spends very little time expounding his own philosophy and instead propounds a huge catalogue of arguments with conclusions to which he is not, in the final analysis, committed. If we had lost only a few pages of his extant works, we could easily have been left with texts which were completely dialectical.

In this context, it may be useful to consider Cicero, *Academica* 2.78, where Philo (of Larissa, Cicero's Academic teacher) and Metrodorus (a pupil of Carneades') are said to attribute to Carneades a skepticism which holds that the wise man cannot apprehend anything (grasp it as true) but may accept an opinion nonetheless. Cicero says he prefers the view of Clitomachus, who holds that Carneades "did not so much accept this view as advance it in argument." This clearly suggests that Carneades offered such a view only for dialectical purposes (as an account of what, given premisses they would accept, one should say about the "wise man" of the Stoics and other philosophers), but it provides limited evidence for the dialectical interpretation, for it does not show that this is Carneades' only mode of argument (cf. Hankinson, 94).

The most important textual evidence in favor of the dialectical interpretation is found at *Academica* 2.139, where Cicero says that Clitomachus used to declare that he had never been able to understand what Carneades did accept (see Striker, 55; Hankinson, 94; Inwood & Gerson, 165; Long & Sedley, Vol 1, 455). This is not the claim that Carneades was a dialectician, however, and it is compatible with the possibility that Clitomachus believed that Carneades accepted some claims, but he was not sure which. More importantly perhaps, Cicero's report is embedded in a discussion of the good, in which Carneades is said to have defended Calliphon's view that the good is pleasure with such zeal "that he was thought

actually to accept it (although Clitomachus used to declare that he had never been able to understand what Carneades did accept)" (tr. Rackham). Taken in this context, the parenthetical comment about Clitomachus' view of Carneades can be interpreted as the claim that Clitomachus did not understand what Carneades held *in this regard*. It does not, therefore, provide definitive evidence for the claim that Carneades was a dialectician and did not have definite views of his own on disputed questions of philosophy.

The dialectical interpretation of Carneades does have the advantage that it saves Carneades from inconsistency (for if he has no positive philosophical views, he need not render anything he says in one argument consistent with what he may say in another), though this advantage gained in this regard is earned by turning Carneades' philosophy into a purely negative philosophy which provides no basis for action. One might therefore try to excuse Carneades from inconsistency without abandoning the claim that he is a skeptic (in the sense that he believes certain knowledge impossible), by emphasizing (as Sextus suggests) the qualified and subjective nature of the assent that he endorsed. So understood, his commitment to persuasiveness ("plausibility") and the assent that this implies is, in virtue of its subjectivity, an attempt to formulate a conception of belief which is compatible with a rejection of claims to objective truth.

The Arguments for Later Pyrrhonism

Carneades' successor as head of the Academy was Clitomachus (d. 110/9 B.C.), the author of exegetical writings (now lost) reporting and explaining Carneades' arguments and his skepticism -- writings referred to in Cicero's *Academica*. He was succeeded by Philo of Larissa (d. 84/3 B.C.). The latter taught, on the basis of Carneades' notion of "plausible" impressions, an epistemology which allowed one to adopt whatever position on a disputed philosophical question seemed to oneself most persuasive, after thorough examination of arguments on all sides -- provided that one carefully refrained from claiming to have established the truth on the matter in question with certainty. As we can see from his pupil Cicero's philosophical writings, this meant in practice the adoption (in this tentative spirit) of many Stoic positions.

The next important ancient skeptic was Aenesidemus, who defected from Philo's Academy and revived Pyrrhonism in the early years of the first century B.C. "The Academics," he said, "especially the ones now, sometimes agree with Stoic opinions and, to tell the truth, appear to be just Stoics in conflict with Stoics" (Photius, *Bibl.* 212, Inwood & Gerson). In response, his eight books of *Pyrrhonian Arguments* propounded the view that "the Pyrrhonist determines nothing, not even this, that he determines nothing" (ibid.). It is perhaps ironic that he himself is reported to have given up on Pyrrhonism, and to have finished his career as a Heracleitean, apparently on the grounds that skeptical antithesis should be seen as a road leading to the realization that reality is full of opposites (*PH* 1.210, compare *AM* 7.349, 9.336-67, 10.216, and Tertullian, *De Anima* 9.5, 14.5).

Though Aenesidemus' books on Pyrrhonism do not survive, they are summarized by Photius (9th c. A.D.), whose account suggests that they systematized Pyrrhonism by establishing standard argumentative

strategies and collecting an array of arguments, puzzles and conundrums borrowed from the whole of Greek philosophy.

We know of later Pyrrhonism primarily through three surviving works of Sextus Empiricus (ca. 200 A.D.): *The Outlines of Pyrrhonism*; a second work *Against the Dogmatists*, consisting of "Against the Logicians" (2 books), "Against the Physicists" (2 books), and one book "Against the Ethicists;" and a third work called *Against the Learned* (*Adversus Mathematicos*), combining the latter five books with six further ones attacking the epistemological pretensions of mathematicians, grammarians, etc. The relations between these books are complex and not yet well explored (in Sextus 1997, Bett argues for a reading of *Against the Ethicists* which would make it propound a very different skepticism than the *Outlines of Pyrrhonism*).

Aenesidemus' most important arguments are the ten modes (or "tropes") which Sextus attributes to "the older skeptics" at *PH* 1.35-163. They create antitheses and promote *epoche* by contrasting:

> (i) the opposing perceptions and views of the world which characterize different species: "For how could one say, with regard to touch [for example], that animals are similarly affected whether their surfaces consist of shell, flesh, needles, feathers or scales? And, as regards hearing, how could one say that perceptions are alike in animals with a very narrow auditory canal and in those with a very wide one, or in those with hairy ears and those with ears that are hairless... [P]erfume seems very pleasant to human beings but intolerable to dung beetles and bees, and the application of olive oil is beneficial to human beings but kills wasps and bees." (*PH* 1.50, 55, Mates)
>
> (ii) the opposing perceptions and views of the world which characterize different individuals: "...the greatest indication of the vast and limitless difference in the intellect of human beings is the inconsistency of the various statements of the Dogmatists concerning what may be appropriately chosen, what avoided, and so on." (*PH* 1.85-86, Mates)
>
> (iii) the opposing perceptions and views of the world which characterize different sense organs: "Pictures seem to the sense of sight to have concavities and convexities," for example, "but not to the touch," and "Let us imagine someone who from birth has ...lacked hearing and sight. He will start out believing in the existence of nothing visible or audible, but only of the three kinds of quality he can register. It is therefore a possibility that we too, having only our five senses, only register from the qualities belonging to the apple those which we are capable of registering. But it may be that there objectively exist other qualities" (*PH* 1.92, 96-7, Mates).
>
> (iv) the opposing perceptions and views of the world which characterize different circumstances: "Thus, things affect us in dissimilar ways depending on whether we are in a natural or unnatural condition, as when people who are delirious or possessed by a god seem to hear spirits but we do not.... And the same water that seems to us to be lukewarm seems boiling hot when poured on an inflamed place.... Further, if someone says that an

intermingling of certain humors produces, in persons who are in an unnatural condition, odd *phantasiai* [impressions] of the external objects, it must be replied that since healthy people, too, have intermingled humors, it is possible that the external objects are in nature such as they appear to those persons who are said to be in an unnatural state, but that these humors are making the external objects appear to the healthy in a natural people other than they are. (*PH* 1.101-2, Mates).

(v) the opposing perceptions and views of the world that characterize different positions and distances and places: for example, "lamplight appears dim in sunlight but bright in the dark. The same oar appears bent in water but straight when out of it" (*PH* 1.119, Mates).

(vi) the opposing perceptions and views of the world that characterize mixtures: "[W]e deduce that since no object strikes us entirely by itself, but along with something, it may perhaps be possible to say what the mixture compounded out of the external object and the thing perceived with it is like, but we would not be able to say what the external object is like by itself... The same sound appears one way when accompanied by a rarefied atmosphere, another way when accompanied by a dense atmosphere" (*PH* 1.124, 125, Mates).

(vii) the opposing perceptions and views of the world due to different quantities and structures: "[I]ndividual filings of a piece of silver appear black, but when united with the whole they affect us as white... And wine, when drunk in moderation, strengthens us, but when taken in excess, disables the body..." (*PH* 1.129, 131, Mates).

(viii) the opposing views possible because of the relativity of all things: "...since all things are relative, we will suspend judgment about what things exist absolutely and in nature... This has two senses. One is in relation to the judging subject [different subjects perceiving differently]... The other in relation to the conceptions perceived with it..." (*PH* 1.135, Mates).

(ix) the opposing perceptions and views of the world due to constancy or rarity of occurrence: "The sun is certainly a much more marvelous thing than a comet. But since we see the sun all the time but the comet only infrequently, we marvel at the comet so much as even to suppose it a divine portent, but we do nothing like that for the sun. If, however, we thought of the sun as appearing infrequently and setting infrequently, and as illuminating everything all at once and then suddenly being eclipsed, we sould find much to marvel at in the matter." (*PH* 1.141, Mates). And

(x) the opposing perceptions and views of what is right and wrong which characterize different ways of life, laws, myths and "dogmatic suppositions": "among the Persians sodomy is customary but among the Romans it is prohibited by law; and with us adultery is prohibited, but among the Massagetae it is by custom treated as a matter of indifference, as

> Eudoxus of Cnidos reports... and with us it is forbidden to have intercourse with one's mother, whereas with the Persians this sort of marriage is very much the custom. And among the Egyptians men marry their sisters, which for us is prohibited by law. (*PH* 1.152, Mates).

Later Pyrrhonian modes more clearly isolate the basic epistemological issues which are raised by the traditional ten modes. The five modes of Agrippa (date unknown; later than Aenesidemus), discussed at *PH* 1.164-77 (which are analyzed in detail by Barnes) promote the suspension of judgment by invoking:

> -- *disagreement*, for among philosophers and ordinary people there is interminable disagreement;
>
> -- *regress ad infinitum*, for the skeptic asks for a proof of a claim, a proof of the reliability of this proof, and so on ad infinitum;
>
> -- *relativity*, for things are relative to both one's subjective nature and the concepts one employs in judging them;
>
> -- *hypothesis*, for the skeptic does not allow us to take as our starting point something which is taken for granted;
>
> -- *circular reasoning*, for the skeptic rejects proofs that are circular, as when sense impressions are used to establish the veracity of the senses.

The standard modes are reduced even further in a basic set of two modes propounded in the following section of the *Outlines of Pyrrhonism* (1.178-79). There it is argued that everything which is apprehended (as true) must be apprehended through itself or some other thing. But according to the Pyrrhonians, the first alternative is undermined by the "controversy among philosophers" and the second by a demand for justification which entails a regress *ad infinitum* which can be stopped only by claiming that something is apprehended as true in virtue of itself (a possibility undermined by the first mode).

The various sets of Pyrrhonian modes systematize ancient arguments against dogmatic philosophical positions, but we should not exaggerate the role they played in ancient skepticism. Judging by Sextus, they are usually backed -- and very frequently supplanted -- by an enormous catalogue of other, specific arguments which were used to argue for *epoche* on whatever topic happens to be at hand (space, time, the good, the gods, fate, the meaningfulness of standard conceptions of human nature, and so on and so forth). No encyclopedia article can fully convey the spirit of the seemingly endless assortment of claims and counter claims that Sextus is ready to marshal on any topic.

The Practical Criterion

In the midst of Sextus' attack on other philosophers, it is easy to forget that he, like Pyrrho, proposed skepticism as a way of life (an *agoge*). Its practical merits are said to include its alleged ability to undermine useless and unfounded speculation which is claimed to characterize dogmatist philosophy. Like Hume, the later Pyrrhonians in this way attempt to supplant philosophical speculation with mundane matters of practical concern. The spirit of this rejection is well captured at *PH* 2.241-44, where Sextus condemns the convoluted arguments and conundrums of ancient dialectic:

> As regards sophisms the exposure of which is useful, the dialectician will not have a word to say, but will propound such arguments as these -- "If it is not so that you both have fair horns and have horns, you have horns; but it is not so that you have fair horns and have horns, therefore you have horns." "If a thing moves, it moves either in the spot where it is or where it is not; but it neither moves in the spot where it is (for it is at rest) nor in that where it is not (for how could a thing be active in a spot where it does not so much as exist?); therefore nothing moves." "Either the existent becomes or the non-existent; now the existent does not become (for it exists); nor yet does the non-existent (for the becoming is passive but the non-existent is not passive); therefore nothing becomes." "Snow is frozen water; but water is black; therefore snow is black."
>
> And when he has made a collection of such trash he draws his eyebrows together, and expounds Dialectic and endeavours very solemnly to establish for us by syllogistic proofs that a thing becomes, a thing moves, snow is white, and we do not have horns, although it is probably sufficient to confront the trash with the plain facts, smashing up their positive affirmation by means of equally weighty contradictory evidence derived from the appearances. (*PH* 2.241-44, Bury, revised, cf. Timon's attitude reported in D.L. 9.111, 2.107)

Appealing to a precedent which was set by early Pyrrhonism, later Pyrrhonians propose that we replace philosophical attempts to establish what is true with an acceptance of appearances which provides a basis for ordinary actions and skeptical assertions. As Diogenes Laertius writes:

> Aenesidemus too in the first book of his *Pyrrhonian Arguments* says that Pyrrho determines nothing dogmatically because of the existence of contradictory arguments, but rather follows appearances. He says the same thing in *Against Wisdom* and *On Investigation*. And Zeuxis, an associate of Aenesidemus, in *On Twofold Arguments* and Antiochus of Laodicea and Apellas in his *Agrippa* posit the phenomena alone. Therefore, according to the skeptics, the appearance is a criterion, as Aenesidemus too says. (D.L. 9.106, Inwood & Gerson)

According to Sextus, "when we question whether the external object is such as it appears, we grant that it does appear, and we are not raising a question about the appearance but rather about what is said about the appearance; this is different from raising a question about the appearance itself. For example, the honey appears to us to be sweet. This we grant, for we sense the sweetness... And even when we do present arguments in oppostion to the appearances, we do not put these forward with the intention of

denying the appearances but by way of pointing out the precipitancy of the Dogmatists..." (*PH* 1.19, Mates).

The later Pyrrhonian commitment to appearances is consolidated in a "Practical Criterion" which was used to establish a "standard of action" which allows the Pyrrhonian to "perform some actions and abstain from others" while not adopting any beliefs in support of so choosing and acting.

> Holding to the appearances, then, we live without beliefs but in accord with the ordinary regimen of life, since we cannot be wholly inactive. And this regimen of life seems to be fourfold: one part has to do with the guidance of nature (*physis*), another with the compulsion of the *pathe* [feelings, affections of the soul], another with the handing down of laws and customs, and a fourth with instruction in arts and crafts (*techne*). Nature's guidance is that by which we are naturally capable of sensation and thought; compulsion of the *pathe* is that by which hunger drives us to food and thirst makes us drink; the handing down of customs and laws is that by which we accept that piety in the conduct of life is good and impiety bad; and instruction in arts and crafts is that by which we are not inactive in whichever of these we acquire. (*PH* 1.23-4, Mates)

Like the early Pyrrhonians, the later Pyrrhonians claimed that skeptical arguments and the Pyrrhonian acceptance of appearances could provide the basis for a happy life characterized by peace of mind. As Diogenes Laertius puts it, "The skeptics say the goal is suspension of judgement, upon which freedom from anxiety follows like a shadow, as Timon and Aenesidemus and their followers put it." (D.L. 9.107, Inwood & Gerson, cf. *PH* 1.29). According to Sextus, the *telos* of skepticism is tranquillity of mind (*ataraxia*) and "moderate" feeling "in respect of things unavoidable." (*PH* 1.26)

> We do not... take Sceptics to be undisturbed in every way -- we say that they are disturbed by things which are forced upon them; for we agree that at times they shiver and are thirsty and have other feelings of this kind. But in these cases ordinary people are afflicted by two sets of circumstances: by the feelings themselves, and no less by believing that these circumstances are bad by nature. Sceptics, who shed the additional opinion that each of these things is bad in its nature, come off more moderately even in these cases. (*PH* 1.29-30, Annas & Barnes)

Mates has criticized this aspect of Pyrrhonism, writing that "It is hard to find much plausibility in the general claim that the person who, on a given occasion, thinks ‘this *appears* to me to be very, very bad’ will be any less upset than if he thought ‘this *is* very, very bad’" (63). One might answer that the Pyrrhonian acceptance of appearances is more constrained than this suggests, for it takes place within the context of equally convincing arguments for and against the view that things are as they appear (the equal force of opposing arguments -- *isostheneia* -- thus plays a central role in Pyrrhonian thinking). In this way the Pyrrhonians purposely try to eliminate thoughts like "This appears very, very bad," trying to substitute in their place thoughts like "This appears bad, but I have equally convincing reasons for thinking it may not be so" (this is clearly manifest in Sextus' rejection of Carneadean plausibility). It is hard to say whether this suffices but the qualifications which Pyrrhonism thus introduces do in this way provide a

more substantial psychological basis for the detached and distant "following" of appearances which is supposed to nurture Pyrrhonian equanimity.

Given the practical goals of Pyrrhonism, the psychological force of Pyrrhonian arguments is in some ways as important as their logical force, for it functioned as a way to constrain the extent of the Pyrrhonian's conviction when he followed his appearances. This highlights an important difference between ancient and modern skeptical arguments. For though the former were employed as logical devices that establish epistemological conclusions, they were also used as psychological tools which were designed to break down attachment to belief and in this way foster *ataraxia*. In explaining why the skeptic's collection of arguments includes some which are weak, Sextus therefore says that the skeptic uses arguments of different strengths "just as doctors have remedies of different strengths for bodily ailments and for those suffering excessively employs the strong ones and for those suffering mildly the mild ones" (*PH* 3.280, Inwood & Gerson).

The Logic of Ancient Skepticism

How radical is ancient skepticism?

Though Sextus makes much of the skeptic's open-minded attitude to the possibility of apprehending truth, it is clear that the arguments that he and other skeptics employed can be used to raise questions about any claim to have established certain truth. At one point Sextus says that the skeptic will not, for example, assent even if he can find no fault with a position. For "[W]hen someone propounds to us a theory which we are unable to refute, we say to him in reply ‘Just as, before the birth of the founder of the School to which you belong, the theory it holds was not as yet apparent as a sound theory... so likewise it is possible that the opposite theory to that which you now propound is... not yet apparent to us, so that we ought not as yet yield assent to this theory which at the moment seems to be valid.’" (*PH* 1.33-34, Bury)

The extent of the ancient skeptic's concerns is also evident in the modes of skepticism (and especially the later modes), which are universally applicable and can in principle be used to question all of our beliefs. Even the skeptics' constant appeals to other ancient philosophies allowed for far more radical doubt than we normally engage, for ancient philosophy contained many extreme points of view. An example is Gorgias' argument for the conclusions that nothing exists, that if it did we could not know so, and if we knew so we could not communicate it. In his work, Sextus takes a special interest in this argument (and preserves one version of our most important fragment) precisely because it raises radical doubts about all things. In a similar vein, we find him exploiting for skeptical ends the opinions of obscure thinkers like Xeniades of Corinth -- who, he says, maintained that every impression and opinion is false (*AM* 7.53, cf. 48: a disconcerting view but arguably no more so than the Protagorean view that every opinion is true).

Mates has underscored the radical nature of the questions that the ancient skeptics, emphasizing that Sextus will not even grant that we have coherent concepts of the external world, soul, body, sense impressions, etc. As he puts it in discussing the Sextus' attitude to the external world, "His own deep skepticism leaves him in a state of *epoche*, not only as to whether there are any such things as ‘external

objects,' but even as to whether these terms of the Dogmatists have any intelligible meaning at all." (55)

How relevant is ancient skepticism?

The fact that ancient skepticism raises radical questions about all opinions and beliefs does not prove that it is relevant to modern and contemporary philosophy. A positive answer to the question whether the questions raised by the skeptics remain relevant must instead be founded on a recognition that they raise doubts that are still taken seriously in mainstream philosophical inquiry.

In this regard it can be said that ancient skepticism contains many arguments which remain of central importance, even though these arguments are frequently obscured by foreign philosophical terminology and ancient ways of speaking. In view of this, many commentators have explored and demonstrated the significance of ancient skepticism in the context of modern philosophy (see, e.g., Popkin, Schmitt, Jardine, Groarke, Fosl). Though the ancient skeptics do not as clearly anticipate modern and contemporary responses to skeptical concerns (skepticism's apparent tie to liberal political concerns, for example), it can be said that they achieved a very clear understanding of the basic epistemological issues raised by the attempt to build a rational basis for belief. The problem of the criterion and the later modes in particular ask pointed questions about our ability to establish a basis for justified belief which still resonate with us today.

One answer to skepticism which appears unique to contemporary philosophy is the suggestion that it can in some way be linguistically dissolved. Wittgenstein, Putnam and many others thus argue that skeptical claims in some way violate the norms that govern meaningful language and in view of this can be rejected as nonsensical. In ancient times, Aristocles wrote that skepticism is inconsistent with the assumption that the skeptic understands language (Eus., *Prep. Ev.* 14.18) but there is no close analogue of this linguistic answer to skepticism within ancient thought. How serious an omission this is depends on whether one believes that attempts to undermine skepticism in this way are plausible or successful (for a negative assessment, see Mates, 68-85).

Is ancient skepticism consistent?

Arguably the most significant question which needs to be asked about skepticism is a recurring feature of the skeptical/anti-skeptical debate. It is the question whether ancient skepticism is consistent. Or is it untenable because inconsistent? More specifically, we might ask how the skeptic's suspension of judgment allows him to come to the *conclusion* that we have no certain knowledge, or that certain knowledge is unattainable. Judging by the extant evidence we have, the skeptics themselves answered that their views are consistent because they accept skepticism in some "undogmatic" way which does not contradict their rejection of claims to truth (see Frede) -- by endorsing appearances, the *eulogon*, the *pithanon*, the Pyrrhonian practical criterion, and so on.

This is not the place for a detailed discussion of such issues, but one cautionary comment is in order. It is in this regard important to remember that the ancient skeptical attack on truth assumes a particular

conception of truth. Burnyeat in particular emphasizes that this ancient conception is thoroughly "realist." It suggests that a claim is true if it corresponds to a real objective world that is not subjective, but exists, as we might now put it, from "a god's eye point of view." As Burnyeat writes:

> In the controversy between the skeptic and the dogmatists over whether any truth exists at all, the issue is whether any proposition of a class of propositions can be accepted as true of a real objective world as distinct from mere appearance. For "true" in these discussions means "true of a real objective world"; the true, if there is such a thing is what conforms with the real, an association traditional to the word *alethes* since the earliest period of Greek philosophy (cf. *AM* XI 221).
>
> Now clearly, if truth is restricted to matters pertaining to real existence, as contrasted with appearance, the same will apply [to related skeptical conceptions]... The notions involved, consistency and conflict, undecidability, *isostheneia*, *epoche*, *ataraxia*, since they are defined in terms of truth, will all relate, via truth to real existence rather than appearance. (Burnyeat, "Can the Sceptic Live His Scepticism," p. 121)

Burnyeat's point should play a central role in contemporary attempts to assess ancient skepticism, for it makes such skepticism an attack on realist truth which has affinities to modern and contemporary anti-realism. In the context of questions about consistency, it provides a possible answer to the charge that the skeptics were inconsistent. For in attempting to understand the skeptics, we must recognize that belief, at least in contemporary philosophical parlance, need not mean "accepting something as true" in the realist sense. It follows that the ancient skeptic's decision to suspend judgment on claims to (realist) truth in principle leaves room for anti-realist forms of belief and assent which are now commonplace in epistemological discussion. Rather than eschew all belief (i.e. belief in *our* sense), this suggests that the ancient skeptic rejects a particular kind of belief to which contemporary epistemology offers a variety of alternatives (founded on coherence accounts of truth, etc.). Unlike the contemporary anti-realist, the ancient skeptic retained a realist conception of "truth" and "belief" and therefore expressed his position as the rejection of belief and the adoption of a weaker following of appearances, subjective impressions, and so on. This difference notwithstanding, the move away from realist conceptions of belief is similar in both cases.

The extent to which the analogy between ancient skepticism and contemporary anti-realism can be carried is open to debate, but it is an important comparison, for it suggests both that skepticism is not fatally inconsistent (for it rejects realist truth and endorses an anti-realist conception of belief) and that the positive account of belief that it proposes is, like many of its arguments against claims to truth, relevant to modern and contemporary philosophical concerns.

Stoicism

Stoicism was one of the new philosophical movements of the Hellenistic period. The name derives from the porch (*stoa poikilê*) in the Agora at Athens decorated with mural paintings, where the members of the school congregated, and their lectures were held. Unlike 'epicurean,' the sense of the English adjective 'stoical' is not utterly misleading with regard to its philosophical origins. The Stoics did, in fact, hold that emotions like fear or envy (or impassioned sexual attachments, or passionate love of anything whatsoever) either were, or arose from, false judgements and that the sage--a person who had attained moral and intellectual perfection--would not undergo them. The later Stoics of Roman Imperial times, Seneca and Epictetus, emphasise the doctrines (already central to the early Stoics' teachings) that the sage is utterly immune to misfortune and that virtue is sufficient for happiness. Our phrase 'stoic calm' perhaps encapsulates the general drift of these claims. It does not, however, hint at the even more radical ethical views which the Stoics defended, e.g. that only the sage is free while all others are slaves, or that all those who are morally vicious are equally so. Though it seems clear that some Stoics took a kind of perverse joy in advocating views which seem so at odds with common sense, they did not do so simply to shock. Stoic ethics achieves a certain plausibility within the context of their physical theory and psychology, and within the framework of Greek ethical theory as that was handed down to them from Plato and Aristotle. It seems that they were well aware of the mutually interdependent nature of their philosophical views, likening philosophy itself to a living animal in which logic is bones and sinews; ethics and physics, the flesh and the soul respectively (another version reverses this assignment, making ethics the soul). Their views in logic and physics are no less distinctive and interesting than those in ethics itself.

Sources of our information on the Stoics

Since the Stoics stress the systematic nature of their philosophy, the ideal way to evaluate the Stoics' distinctive ethical views would be to study them within the context of a full exposition of their philosophy. Here, however, we meet with the problem about the sources of our knowledge about Stoicism. We do not possess a single complete work by any of the first three heads of the Stoic school: the 'founder,' Zeno of Citium in Cyprus (344-262 BC), Cleanthes (d. 232 BC) or Chrysippus (d. ca. 206 BC). Chrysippus was particularly prolific, composing over 165 works, but we have only fragments of his works. The only complete works by Stoic philosophers that we possess are those by writers of Imperial times, Seneca (4 BC-65 AD), Epictetus (c. 55-135) and the Emperor Marcus Aurelius (121-180) and these works are principally focused on ethics. They tend to be long on moral exhortation but give only clues to the theoretical bases of the moral system. For detailed information about the Old Stoa (i.e. the first three heads of the school and their pupils and associates) we have to depend on either doxographies, like pseudo-Plutarch *Philosophers' Opinions on Nature*, Diogenes Laertius' *Lives of Eminent Philosophers* (3rd c. AD), and Stobaeus' *Excerpts* (5th c. AD)--and their sources Aetius (ca. 1st c. AD) and Arius Didymus (1st c. B.C.-AD)--or other philosophers (or Christian apologists) who discuss the Stoics for their own purposes. Nearly all of the latter group are hostile witnesses. Among them are the Aristotelian commentator Alexander of Aphrodisias (late 2nd c. AD) who criticises the Stoics in *On Mixture* and *On Fate*, among other works; the Platonist Plutarch of Chaeronea (1st-2nd c. AD) who authored works such as *On Stoic Self-Contradictions* and *Against the Stoics on Common Conceptions*; the medical writer Galen (2nd c. AD), whose outlook is roughly Platonist; the Pyrrhonian skeptic, Sextus Empiricus (2nd c. AD); Plotinus (3rd c. AD); the Christian bishops Eusebius (3rd-4th c. A.D.) and Nemesius (ca. 400 AD); and the sixth-century neoplatonist commentator on Aristotle, Simplicius. Another important source is Cicero (1st c. BC). Though his own philosophical position derives from that of his teacher Philo of Larissa and the New Academy, he is not without sympathy for what he sees as the high moral tone of Stoicism. In works like his *Academic Books*, *On the Nature of the Gods*, and *On Ends* he provides summaries in Latin, with critical discussion, of the views of the major Hellenistic schools of thought.

From these sources, scholars have attempted to piece together a picture of the content, and in some cases, the development of Stoic doctrine. In some areas, there is a fair bit of consensus about what the Stoics thought and we can even attach names to some particular innovations. However, in other areas the proper interpretation of our meagre evidence is hotly contested. Until recently, non-specialists have been largely excluded from the debate because many important sources were not translated into modern languages. Fragments of Stoic works and testimonia in their original Greek and Latin were collected into a three-volume set in 1903-5 by H. von Arnim, *Stoicorum Veterum Fragmenta*. In writings on the 'old' Stoics, fragments and testimonia are often referred to by von Arnim's volume numbers and text numeration; e.g. SVF I.345=Diogenes Laertius, *Lives* 4.40. In 1987, A. A. Long and David Sedley brought out *The Hellenistic Philosophers* (*LS*) which contains in its first volume English translations and commentary of many important texts on Stoics, Epicureans and Skeptics. Unless otherwise specifically noted, I refer in what follows to texts by or about Stoics using the author's name followed by Long and Sedley's notation for the text, e.g. 47G=section 47 of their work, text G (unless otherwise noted, I use their translation,

sometimes slightly altered).

Philosophy and Life

When considering the doctrines of the Stoics, it is important to remember that they think of philosophy not as an interesting pastime or even a particular body of knowledge, but as a way of life. They define philosophy as a kind of practice or exercise (*askêsis*) in the expertise concerning what is beneficial (Aetius, 26A). Once we come to know what we and the world around us are really like, and especially the nature of value, we will be utterly transformed. This soteriological element is common to their main competitors, the Epicureans, and perhaps helps to explain why both were eventually eclipsed by Christianity. The *Meditations* of Marcus Aurelius provide a fascinating picture of a would-be Stoic sage at work on himself. The book, also called *To Himself*, is the emperor's diary. In it, he not only reminds himself of the content of important Stoic teaching but also reproaches himself when he realises that he has failed to incorporate this teaching into his life in some particular instance. For the influence of Stoic philosophy on a life in our times, see Admiral James Stockdale's account of his use of the philosophy of Epictetus as a prisoner of war in Vietnam.

Physical Theory

An examination of Stoic ontology might profitably begin with a passage from Plato's *Sophist*. There (247d-e), Plato asks for a mark or indication of what is real or what has being. One answer which is mooted is that the capacity to act or be acted upon is the distinctive mark of real existence or ‘that which is.’ The Stoics accept this criterion and add the rider that only bodies can act or be acted upon. Thus, only bodies exist. However, they allow that there are other ways of being part of nature than by virtue of existing. Incorporeal things like time, place or sayables (*lekta*, see below) are ‘subsistent’ (*huphestos*, Galen 27G)--as are imaginary things like centaurs. Moreover, all existent things are particular. The Stoics call universals ‘figments of the mind’ and seem to offer a conceptualist treatment akin to Locke's, treating an apparent predication like "man is a rational, mortal animal" as the disguised conditional, "if something is a man, then it is a rational mortal animal" (Sextus Empiricus, 30I).

In accord with this ontology, the Stoics, like the Epicureans, make God material. But while the Epicureans think the gods are too busy being blessed and happy to be bothered with the governance of the universe, the Stoic God is immanent throughout the whole of creation and directs its development down to the smallest detail. God is identical with one of the two ungenerated and indestructible first principles (*archai*) of the universe. One principle is matter which they regard as utterly unqualified and inert. It is that which is acted upon. God is identified with an eternal reason (*logos*, Diog. Laert. 44B) or intelligent designing fire (Aetius, 46A) which structures matter in accordance with Its plan. This plan is enacted time and time again, beginning from a state in which all is fire, through the generation of the elements, to the creation of the world we are familiar with, and eventually back to fire in a cycle of endless recurrence. The designing fire of the conflagration is likened to a sperm which contains the principles or stories of all the things which will subsequently develop (Aristocles in Eusebius, 46G).

Under this guise, God is also called ‘fate.’ It is important to realise that the Stoic God does not craft its world in accordance with its plan from the outside, as the demiurge in Plato's *Timaeus* is described as doing. Rather, the history of the universe is determined by God's activity internal to it, shaping it with its differentiated characteristics. The biological conception of God as a kind of living heat or seed from which things grow seems to be fully intended.

The first thing to develop from the conflagration are the elements. Of the four elements, the Stoics identify two as active (fire and air) and two as passive (water and earth). The active elements, or at least the principles of hot and cold, combine to form breath or pneuma. Pneuma, in turn, is the ‘sustaining cause’ (*causa continens*, *synektikon aition*) of all existing bodies and guides the growth and development of animate bodies. What is a sustaining cause? The Stoics think that the universe is a plenum. Like Aristotle, they reject the existence of empty space or void (except that the universe as a whole is surrounded by it). Thus, one might reasonably ask, ‘What marks any one object off from others surrounding it?’ or, ‘What keeps an object from constantly falling apart as it rubs elbows with other things in the crowd?’ The answer is: pneuma. Pneuma, by its nature, has a simultaneous movement inward and outward which constitutes its inherent ‘tensility.’ (Perhaps this was suggested by the expansion and contraction associated with heat and cold.) Pneuma passes through all (other) bodies; in its outward motion it gives them the qualities that they have, and in its inward motion makes them unified objects (Nemesius, 47J). In this respect, pneuma plays something of the role of substantial form in Aristotle for this too makes the thing of which it is the form both ‘some this,’ i.e. an individual, and ‘what it is’ (*Metaph.* VII, 17). Because pneuma acts, it must be a body and it appears that the Stoics stressed the fact that its blending with matter is ‘through and through’ (Galen 47H, Alex. Aph. 48C). Perhaps as a result of this, they developed a theory of mixture which allowed for two bodies to be in the same place at the same time. It should be noted, however, that some scholars (e.g. Richard Sorabji) think that the claim that pneuma is blended through the totality of matter is a conclusion that the Stoics' critics adversely drew about what some of their statements committed them to. Perhaps instead they proposed merely that pneuma is the matter of a body at a different level of description.

Pneuma comes in gradations and endows the bodies which it pervades with different qualities as a result. The pneuma which sustains an inanimate object is called (*LS*) a ‘tenor’ (*hexis*, lit. a holding). Pneuma in plants is, in addition, (*LS*) physique (*phusis*, lit. ‘nature’). In animals, pneuma gets called also soul (*psychê*) and in rational animals pneuma is, besides, the commanding faculty (*hêgemonikon*) (Diog. Laert. 47O, Philo 47P)--that responsible for thinking, planning, deciding. The Stoics assign to ‘physique’ or ‘nature’ all the purely physiological life functions of a human animal (such as digestion, breathing, growth etc.)--self-movement from place to place is due to soul. Their account of the human soul (mind) is strongly monistic. Though they speak of the soul's faculties, these are parts of the commanding faculty associated with the physical sense organs (Aetius, 53H). Unlike the Platonic tri-partite soul, all impulses or desires are direct functions of the rational, commanding faculty. This strongly monistic conception of the human soul has serious implications for Stoic epistemology and ethics. In the first case, our impressions of sense are affections of the commanding faculty. In mature rational animals, these impressions are thoughts, or representations with propositional content. Though a person may have no choice about whether she has a particular rational impression, there is another power of the commanding faculty which the Stoics call ‘assent’ and whether one assents to a rational impression is a matter of

volition. To assent to an impression is to take its content as true. To withhold assent is to suspend judgement about whether it is true. Because both impression and assent are part of one and the same commanding faculty, there can be no conflict between separate and distinct rational and nonrational elements within oneself--a fight which reason might lose. Compare this situation with Plato's description of the conflict between the inferior soul within us which is taken in by sensory illusions and the calculating part which is not (*Rep.* X, 602e). There is no reason to think that the calculating part can always win the epistemological civil war which Plato imagines to take place within us. But because the impression and assent are both aspects of one and the same commanding faculty according to the Stoics, they think that we can always avoid falling into error if only our reason is sufficiently disciplined. In a similar fashion, impulses or desires are movements of the soul toward something. In a rational creature, these are exercises of the rational faculty which do not arise without assent. Thus, a movement of the soul toward X is not automatically consequent upon the impression that X is desirable. This is what the Stoics' opponents, the Academic Skeptics, argue against them is possible (Plutarch, 69A.) The Stoics, however, claim that there will be no impulse toward X--much less an action--unless one assents to the impression (Plutarch, 53S). The upshot of this is that all desires are not only (at least potentially) *under the control* of reason, they *are* acts of reason. Thus there could be no gap between forming the decisive judgement that one ought to do X and an effective impulse to do X.

Since pneuma is a body, there is a sense in which the Stoics have a materialist theory of mind. The pneuma which is a person's soul is subject to generation and destruction (Plutarch 53 C, Eusebius 53W). Unlike for the Epicureans, however, it does not follow from this that my soul will be destroyed at the time at which my body dies. Chrysippus alleged that the souls of the wise would not perish until the next conflagration (Diog. Laert. 7.157=SVF 2.811, not in *LS*). Is this simply a failure of nerve on the part of an otherwise thorough-going materialist? Recall that the distinctive movement of pneuma is its simultaneous inward and outward motion. It is this which makes it tensile and capable of preserving, organising and, in some cases, animating the bodies which it interpenetrates. The Stoics equate virtue with wisdom and both with a kind of firmness or tensile strength within the commanding faculty of the soul (Arius Didymus 41H, Plutarch 61B, Galen 65T). Perhaps the thought was that the souls of the wise had a sufficient tensile strength that they could subsist as a distinct body on their own. Later Stoics like Panaetius (2nd c. BC) and Posidonius (first half 1st c. BC) may have abandoned this view of Chrysippus'.

Logic

For the Stoics, the scope of what they called ‘logic’ (*logikê*, i.e. knowledge of the functions of *logos* or reason) is very wide, including not only the analysis of argument forms, but also rhetoric, grammar, the theories of concepts, propositions, perception, and thought, and what we would call epistemology and philosophy of language. Formally, it was standardly divided into just two parts: rhetoric and dialectic (Diog. Laert., 31A). Much has been written about the Stoics' advances in logic (in our narrow sense of the word). In general, one may say that theirs is a logic of propositions rather than a logic of terms, like the Aristotelian syllogistic. One of the accounts they offer of validity is that an argument is valid if, through the use of certain ground rules (*themata*), it is possible to reduce it to one of the five

indemonstrable forms (Diog. Laert., 36A). These five indemonstrables are the familiar forms:

- if p then q; p; therefore q (modus ponens);
- if p then q; not q; therefore not-p (modus tollens);
- it is not the case that both p and q; p; therefore not-q;
- either p or q; p; therefore not-q;
- either p or q; not p; therefore q

Though these and other developments in logic are interesting in their own right, the Stoic treatment of certain problems about modality and bivalence are more significant for the shape of Stoicism as a whole. Chrysippus in particular was convinced that bivalence and the law of excluded middle apply even to contingent statements about particular future events or states of affairs. (The law of excluded middle says that for a proposition, p, and its contradictory, not-p, '(p or not-p)' is necessarily true, while bivalence insists that the truth table that defines a connective like 'or' contains only two values, true and false.) Aristotle's discussion in chapter 9 of *On Interpretation* of a hypothetical sea battle which either will or will not happen tomorrow has traditionally been taken to deny this. (The proper interpretation of Aristotle's position is disputed.) He presents the argument that if it is either true or false now that there will be a sea battle tomorrow (and let us suppose for the sake of argument that it is false), then our present deliberation about whether we should go out and fight tomorrow is pointless for it is already true now, whatever we decide, that we won't fight. Perhaps there are causal factors at work which will determine this, e.g. we may decide to fight but today's high temperatures will cause the wind to be against us tomorrow. On one reading, Aristotle's response to this is to deny the principle of bivalence for future contingent statements: it is now neither true nor false that there will be a sea battle tomorrow. Chrysippus apparently could not agree to making such an exception and he may have taken the price of consistency to be a strict causal determinism: all things happen through antecedent causes (Cicero, 38G). Above I noted that the Stoics thought that God or designing fire contained within itself the plan of all that is to happen between conflagrations and that it brings this plan to fruition in its action upon matter. Viewed in isolation from Stoic logic, this might have seemed arbitrary but clearly it was not.

The Stoics express their commitment to causal determinism in a potentially misleading way. They treat the claim that "all things happen through antecedent causes" as an alternative formulation of the claim that "all things happen through fate" (*kath heimarmenên*). But, in fact, the Stoics do not accept the doctrine that modern philosophers call fatalism. The matter is doubly confused, because the modern arguments for fatalism often emerge from the very considerations about bivalence that Aristotle discusses in *On Interpretation*. The classic example is Richard Taylor's argument. One way to see the difference between Taylor's fatalism and Chrysippus' causal determinism, is to ask, "What makes it the case that we won't have a sea battle tomorrow?" The Chrysippean causal determinist can say, "the lack of wind" or perhaps even "our decision not to go out and fight" and these things could all have been different, if only things had been different at some earlier time. So, though the present state of affairs determines that the future will only be one way, nonetheless there is a sense in which other things are possible (Alex. Aph., 38H). The fatalist responds that what makes it the case that we will not fight tomorrow is the fact that the proposition S, "There will not be a sea battle on such and such a date," has always been true. Much turns on what one says about the modal status of this truth. Is the proposition "It

is true that not-S" itself necessary? Diodorus Cronus, against whom Chrysippus argued, claimed that (1) truths about the past are necessary: it is not merely that they aren't other than they are--they can't be other than they are, for nothing has the power to change the past (Epictetus, 38A). He also claimed that (2) nothing impossible follows from what is possible. In the so-called Master Argument, he attempted to show that these two theses were incompatible with the claim that (3) there is something which is possible, but yet does not happen. The details of the Master Argument are a matter of much dispute. We know that it was alleged to show that these three propositions formed an inconsistent triad, but exactly how it did this remains uncertain. We also know that Diodorus' manner of resolving this inconsistency was to reject (3) and to define the possible as that which is or will be the case. Now consider our sea battle which will not take place tomorrow. If "there is a sea battle on such and such a date" is now false and will not be true, then by Diodorus' lights, it is impossible (Boethius, 38C)! Chrysippus felt the need to preserve the thesis that there are things which are possible but which do not happen. To this end, he rejected the proposition (2) that what is impossible does not follow from what is possible, using the following example: consider the conditional "if Dion is dead, then this one is dead" when ostensive reference is being made to Dion. The antecedent is possible, since Dion will one day be dead. Hence, let us suppose it true. Then, by modus ponens, it follows that "this one is dead." However, the proposition that "this one is dead" is impossible (necessarily false), since one cannot make the requisite ostensive reference to a dead man so as to make it true that "this one [i.e. the (living) thing I'm pointing to] is dead," for a dead person isn't the same thing as what was there previously (Alex. Aph., 38F). This may appear utterly *ad hoc*, and it is possibly wrong, given the Stoics' views about ‘sayables’ (*lekta*); but it is exactly the response that Chrysippus should make. It once again illustrates the systematic character of Stoic philosophy.

With respect to language, the Stoics distinguish between the signification, the signifier and the name-bearer. Two of these are bodies: the signifier which is the utterance and the name-bearer which gets signified. The signification, however, is an incorporeal thing called a *lekton*, or ‘sayable,’ and it, and neither of the other two, is what is true or false (Sextus Empiricus, 33B). They define a sayable as "that which subsists in accordance with a rational impression." Rational impressions are those alterations of the commanding faculty whose content can be exhibited in language. Presumably ‘*graphei Sôkratês*’ and ‘Socrates writes’ exhibit the contents of one and the same rational impression in different languages. At first glance, this looks very like a modern theory of propositions. But propositions (*axiômata*) are only one subspecies of sayables. Sayables also include questions and commands on the one hand, and, in a category of sayables called ‘incomplete,’ the Stoics include predicates and incomplete expressions like ‘*graphei*’ (he or she writes) (Diog. Laert., 33F). An incomplete sayable like ‘writes’ gets transformed into a proposition by being attached to a nominative case (*ptôsis*, Diog. Laert., 33G). Here a ‘nominative case’ seems to mean the *signification* of the inflected word, *Sôkratês*’ or ‘*ho anthrôpos*’--the latter being the nominative case (as *we* would say) of the Greek *word* ‘man’--not that inflected word itself. The Stoic doctrine of case is one of those areas where there is as yet little consensus. Stoic propositions are unlike propositions in contemporary theories in another way too: Stoic sayables are not timelessly true or false. If it is now daytime, the *lekton* corresponding to an utterance of ‘it is day’ is true. Tonight, however, it will be false (cf. Alex. Aph. in Simplicius, 37K). Finally, the Stoic theory gives a certain kind of priority to propositions involving demonstratives. ‘This one is writing’ is definite, while ‘someone is writing’ is indefinite. Strikingly, ‘Socrates is writing’ is said to be intermediate between these two. When there is a

failure of reference, the Stoics say that the *lekton* is destroyed and this is supposed to provide the reason why ‘this one is dead’ (spoken in relation to Dion) is impossible (necessarily false).

Perhaps the most famous topic considered under the Stoic heading of logic is that of the criterion of truth and the Stoics' disputes with the skeptical New Academy about it. According to Chrysippus, the criterion of truth is the ‘cognitive impression’ (*phantasia katalêptikê*, lit. an impression that firmly grasps its object) (Diog. Laert., 40A). A criterion or canon of truth is an instrument for definitely determining that something is true, and the Hellenistic schools all provide some view on how it is that we are to measure or evaluate whether something is true or not. The Stoics' cognitive impression is an impression which (according to Zeno's definition, cf. Cicero, SVF I.59) "arises from that which is; is stamped and impressed in accordance with that very thing; and of such a kind as could not arise from what is not" (Sextus Empiricus, 40E). Recall that among the powers of the commanding faculty is the capacity to assent or withhold assent to impressions. The fact that it is always within our power to withhold assent means that if we are sufficiently disciplined, we are capable of avoiding error. In itself, it does not mean that we are capable of attaining knowledge, for there might not be any impressions that one can be confident in assenting to. The cognitive impression was supposed to fill that role: when you experience one of these, provided that you recognize it as such, you can, on its basis, assert definitely that the matter in question is true. It was initially supposed that such an impression commanded one's assent by its very nature: it "all but seizes us by the hair" and drags us to assent. But this optimistic assessment seems to have been qualified in the face of criticism by members of the Skeptical Academy--perhaps, even if there are such impressions, it is not so easy to be sure when one is experiencing one.

However, the Stoics do not maintain that the mere having of a cognitive impression constitutes knowledge (*epistêmê*). Indeed, not even assent to such an impression amounts to knowledge: this is only cognition or grasp (*katalêpsis*) of some individual fact. Real knowledge (*epistêmê*) requires cognition which is secure, firm and unchangeable by reason (Sextus Empiricus, 41C)--and, furthermore, worked into a systematic whole with other such cognitions (Arius Didymus, 41H). Weak and changeable assent to a cognitive impression is only an act of ignorance. It is not entirely clear where opinion or belief in general (*doxa*) stands in this categorization. Most Stoic sources define it as ‘assent to the incognitive’ (i.e. to an impression that does not firmly grasp its object) (see Sextus Empiricus, 41E) but some suggest that changeable assent to a cognitive impression might still count as opinion. There is a potential for serious confusion when we try to assimilate the Stoic view to contemporary epistemology. Modern definitions of knowledge make the agent's belief that P a necessary but not sufficient condition for knowing that P. For the Stoics, *doxa* (involving ‘weak’ assent) and knowledge are incompatible. In any event, there is an absolute distinction between the wise and the ignorant. Only the Stoic sage's assent to cognitive impressions clearly counts as knowledge for only a sage has the proper discipline always to avoid withdrawing assent, or assenting to things that one shouldn't. The Stoics call this epistemic virtue ‘non-precipitancy’ (*aproptôsia*) and it underlies their claim that the Stoic sage never makes mistakes (41D).

The Skeptics responded by denying the existence of cognitive impressions. According to Arcesilaus, "no impression arising from something true is such that an impression arising from something false could not also be just like it" (Cicero, 40D). So Arcesilaus denies that the third conjunct of the Stoic definition of

the cognitive impression is ever satisfied. We can distinguish two specific tactics for denying this. First, the Skeptics point to cases of insanity. In his madness, Heracles had the impression that his children were, in fact, the children of his enemy Eurystheus and killed them. Since the impression must have been utterly convincing to him at the time at which he had it (judging by his subsequent action), it is clear from this that there can be false impressions which are indistinguishable from ones that are allegedly "stamped and impressed in accordance with that very thing" (Sextus Empiricus, 41H). Their second line of attack was to draw attention to objects which are so similar as to be indistinguishable (so that a completely accurate impression from one would be indistinguishable from one from the other). The story is related (Diog. Laert., 40F) that the Stoic philosopher Sphaerus (a student of Zeno's) was tricked into thinking that wax pomegranates were real. This was again supposed to show thay there could be impressions arising from what is not [sc. a pomegranate] which are indistinguishable from a cognitive impression.

The Stoics met these arguments by first pointing out that Heracles' inability to distinguish cognitive from incognitive impressions in his madness says nothing about the capacities of normal human beings. It is no part of their thesis that *just anyone* can distinguish between cognitive and incognitive impressions. Their response to the second line of attack was two-fold. The first is a metaphysically motivated answer: if any two objects really were indistinguishable, they would be identical. This doctrine has come to be known as the identity of indiscernibles. They also replied that the Stoic sage would withhold assent in cases where things are too similar to be confident that one had it right (Cicero, 40I)--Sphaerus' response to his predicament was to say that he only assented to the proposition that it was ‘reasonable’ that what he was presented with were pomegranates (and that was true!).

In some ways, the Stoics have an easier time with Skeptical objections than contemporary non-skeptics do. At bottom what the Stoics are committed to is the two-fold view that it is within our power to avoid falling into error and that there is a kind of impression which reveals to us the world as it really is and which is different from those impressions which might not so reveal the world. They are manifestly *not* committed to defending our ordinary intuitions about the range of knowledge: that most people in fact know most of the things that they and everyone else thinks that they know. The only person we can be sure has any knowledge is the Stoic sage and sages are as rare as the phoenix (Alex. Aph., 61N). Everyone else is equally ignorant. This absolute distinction between the wise and the ignorant is a consequence of the Stoic definition of knowledge as the "cognition which is secure and unchangeable by reason" (Arius Didymus, 41H). Either one's cognition is like this or it is not. By making opinion a kind of ignorance (contrast Plato, *Rep* V. 474a ff), they do not allow room for an intermediate state between the wise man and all the rest of us.

But if we leave aside the question of whether we in fact know anything, there are some serious puzzles about the cognitive impression. The Stoics insist that the cognitive impression not only "arises from what is and is stamped and impressed in accordance" with the thing from which it arises, but also that it is "such as could not arise from that which is not." But it seems that we can imagine all kinds of situations in which we might be in a position where the sense impressions that we have are indistinguishable from ones that misrepresent the world. Thus, consider Descartes' evil demon hypothesis or its modern counterpart, the brain in a vat scenario. In the latter example it is stipulated that electrical stimulation of

your brain by incredibly clever but unscrupulous scientists produces sense impressions that are indistinguishable from the ones that you are presently having. Surely here we have a demonstration that there could not be a true impression which is such that it *could not* arise from what is not. No sane person thinks that these skeptical hypotheses are actually true. The point is rather that if one of them were true, our sense experience would be indistinguishable from what (we take to be) our true and accurate sense impressions of real tables, chairs and fireplaces. Doesn't this show that there is no such thing as a cognitive impression?

One thing to note in passing is that skeptical scenarios like the evil demon or the brain in the vat did not seem to figure in the debate between the Stoics and Skeptics. The Skeptics press the point that *at the time* the dream may be completely convincing to the dreamer, even if she does not believe that the events actually transpired when she awakes (Cicero, *Lucullus* or *Academica* II, 88). They do not consider thought experiments in which *all* our sense experience is systematically misleading. But if we set this aside, there will still be one important difference between a clear and distinct impression that arises from a real fireplace and one that arises from the manipulation of my neurons by unscrupulous brain scientists. The first is *caused by* a fireplace, while the second is caused by some other means. When the Stoics say that a cognitive impression is "of such a sort as could not arise from what is not," they can be interpreted to mean that the true clear and distinct impression will be *different* from a false one. They might deny that the difference between the two is always something that can be *discerned* from the subject's point of view. If this is so, then the Stoics' position would be somewhat akin to externalist theories of knowledge or justification. Externalists insist that an agent might know a proposition or be justified in believing a proposition even when, nonetheless, the evidence for that belief is not subjectively available to the person. So, on one early externalist theory of knowledge, it was suggested that an agent might know a certain sort of proposition (e.g. that there is a fireplace here) if their belief that there is a fireplace here was caused by a reliable causal process (e.g. a normal visual system)--and not, e.g., by the interventions of wicked scientists.

So where does this leave the matter? *If* this is the right way to understand the definition of the Stoic cognitive impression, then it would seem that they win their argument with the Skeptics. Examples of false impressions that are subjectively indiscernible from clear and distinct, true, ones do not show that there are no cognitive impressions. However, the admission that a cognitive impression might be subjectively indistinguishable from a false impression does alter the sense in which the cognitive impression can serve as a criterion of truth. Assent to a cognitive impression will guarantee that what you assent to is true. But, because cognitive impressions can be indistinguishable from the subject's point of view from false ones, the Stoics can no longer say that even the sage can be confident that what seems to be a cognitive impression actually is one. Thus instead of automatically commanding assent, the cognitive impression (according to later Stoics) commands assent "if there is no impediment" (Sextus Empiricus, 40K), and if it has been successfully "tested" and is "irreversible" (cf. Sextus Empiricus, 69E). This means that I should only assent to what seems to me to be a cognitive impression if I have reason to believe that I'm not in a context where deceptive but convincing impressions are possible. But the Stoic sage never errs. So when will I have absolutely compelling reasons to believe that I'm not presented with a convincing but deceptive impression? For these reasons, the Pyrrhonian skeptic Sextus Empiricus argues that the Stoic sage will never assent to any impression. In practice, he will suspend

judgement, just like the Skeptic does (41C). Another suggestion is that the Stoic sage hedges his bets by assenting only to the impression that it is *reasonable* that there is fireplace here (as Sphaerus did about the pomegranates, 40F). In this case it will also be hard to see how he differs from a skeptic who takes ‘the reasonable’ as his criterion (Sextus Empiricus, 69B).

Ethics

In many ways, Aristotle's ethics provides the form for the adumbration of the ethical teaching of the Hellenistic schools. One must first provide a specification of the goal or end (*telos*) of living. This may have been thought to provide something like the dust jacket blurb or course description for the competing philosophical systems--which differed radically over how to give the required specification.

A bit of reflection tells us that the goal that we all have is happiness or flourishing (*eudaimonia*). But what is happiness? The Epicureans' answer was deceptively straightforward: the happy life is the one which is most pleasant. (But their account of what the highest pleasure consists in was not at all straightforward.) Zeno's answer was "a good flow of life" (Arius Didymus, 63A) or "living in agreement," and Cleanthes clarified that with the formulation that the end was "living in agreement with nature" (Arius Didymus, 63B). Chrysippus amplified this to (among other formulations) "living in accordance with experience of what happens by nature;" later Stoics inadvisably, in response to Academic attacks, substituted such formulations as "the rational selection of the primary things according to nature." The Stoics' specification of what happiness consists in cannot be adequately understood apart from their views about value and human psychology.

The best way into the thicket of Stoic ethics is through the question of what is good, for all parties agree that possession of what is genuinely good secures a person's happiness. The Stoics claim that whatever is good must benefit its possessor under all circumstances. But there are situations in which it is not to my benefit to be healthy or wealthy. (We may imagine that if I had money I would spend it on heroin which would not benefit me.) Thus, things like money are simply not good, in spite of how nearly everyone speaks, and the Stoics call them ‘indifferents’ (Diog. Laert., 58A)--i.e., neither good nor bad. The only things that are good are the characteristic excellences or virtues of human beings (or of human minds): prudence or wisdom, justice, courage and moderation, and other related qualities. These are the first two of the ‘Stoic paradoxes’ discussed by Cicero in his short work of that title: that only what is noble or fine or morally good (*kalon*) is good at all, and that the possession (and exercise) of the virtues is both necessary and sufficient for happiness. But the Stoics are not such lovers of paradox that they are willing to say that my preference for wealth over poverty in most circumstances is utterly groundless. They draw a distinction between what is good and things which have value (*axia*). Some indifferent things, like health or wealth, have value and therefore are to be preferred, even if they are not good, because they are *typically* appropriate, fitting or suitable (*oikeion*) for us.

Impulse, as noted above, is a movement of the soul toward an object. Though these movements are subject to the capacity for assent in fully rational creatures, impulse is present in all animate (self-moving) things from the moment of birth. The Stoics argue that the original impulse of ensouled

creatures is toward what is appropriate for them, or aids in their self-preservation, and not toward what is pleasurable, as the Epicureans contend. Because the whole of the world is identical with the fully rational creature which is God, each part of it is naturally constituted so that it seeks what is appropriate or suitable to it, just as our own body parts are so constituted as to preserve both themselves and the whole of which they are parts. The Stoic doctrine of the natural attachment to what is appropriate (*oikeiôsis*) thus provides a foundation in nature for an objective ordering of preferences, at least on a prima facie basis. Other things being equal, it is objectively preferable to have health rather than sickness. The Stoics call things whose preferability is overridden only in very rare circumstances "things according to nature." As we mature, we discover new things which are according to our natures. As infants perhaps we only recognised that food and warmth are appropriate to us, but since humans are rational, more than these basic necessities are appropriate to us. The Greek term ‘*oikeion*’ can mean not only what is suitable, but also what is akin to oneself, standing in a natural relation of affection. Thus, my blood relatives are--or least ought to be--*oikeioi*. It is partly in this sense that we eventually come to the recognition--or at least ought to--that other people, insofar as they are rational, are appropriate to us. Cicero's quotation of Terence's line ‘nothing human is alien to me’ in the context of *On Duties* I.30 echoes this thought. More generally, the unfolding of God's providential plan is rational (and therefore beneficial) through and through, so that in some sense what will in fact happen to me in accordance with that plan must be appropriate to me.

When we take the rationality of the world order into consideration, we can begin to understand the Stoic formulations of the goal or end. "Living in agreement with nature" is meant to work at a variety of levels. Since *my* nature is such that health and wealth are appropriate to me (according to my nature), other things being equal, I ought to choose them. Hence the formulations of the end by later Stoics stress the idea that happiness consists in the rational selection of the things according to nature. But, we must bear in mind an important caveat here. Health and wealth are not the only things which are appropriate to me. So are other rational beings and it would be irrational to choose one thing which is appropriate to me without due consideration of the effect of that choice on other things which are also appropriate to me. This is why the later formulations stress that happiness consists in the *rational* selection of the things according to nature. But if I am faced with a choice between increasing my wealth (something which is prima facie appropriate to my nature) and preserving someone else's health (which is something appropriate to something which is appropriate to me, i.e. another rational being), which course of action is the rational one? The Stoic response is that it is the one which is ultimately both natural and rational: that is, the one that, so far as I can tell from my experience with what happens in the course of nature (see Chrysippus' formula for the end cited above, 63B), is most in agreement with the unfolding of nature's rational and providential plan. Living in agreement with nature in this sense can even demand that I select things which are not typically appropriate to my nature at all--when that nature is considered in isolation from these particular circumstances. Here Chrysippus' remark about what his foot would will if it were conscious is apposite.

> As long as the future is uncertain to me I always hold to those things which are better adapted to obtaining the things in accordance with nature; for God himself has made me disposed to select these. But if I actually knew that I was fated now to be ill, I would even have an impulse to be ill. For my foot too, if it had intelligence, would have an impulse to

get muddy. (Epictetus, 58J)

We too, as rational parts of rational nature, ought to choose in accordance with what will in fact happen (*provided* we can know what that will be, which we rarely can--we are not gods; outcomes are uncertain to us) since this is wholly good and rational: when we cannot know the outcome, we ought to choose in accordance with what is typically or usually nature's purpose, as we can see from experience of what usually does happen in the course of nature. In extreme circumstances, however, a choice, for example, to end our lives by suicide can be in agreement with nature.

So far the emphasis has been on just one component of the Stoic formulation of the goal or end of life: it is the "rational selection of the things according to nature." The other thing that needs to be stressed is that it is rational *selection*--not the attainment of--these things which constitutes happiness. (The Stoics mark the distinction between the way we ought to opt for health as opposed to virtue by saying that I select (*eklegomai*) the preferred indifferent but I choose (*hairoûmai*) the virtuous action.) Even though the things according to nature have a kind of value (*axia*) which grounds the rationality of preferring them (other things being equal), this kind of value is still not goodness. From the point of view of happiness, the things according to nature are still indifferent. What matters for our happiness is whether we select them rationally and, as it turns out, this means selecting them in accordance with the virtuous way of regarding them (and virtuous action itself). Surely one motive for this is the rejection of even the limited role that external goods and fortune play in Aristotelian ethics. According to the Peripatetics, the happy life is one in which one exercises one's moral and theoretical virtues. But one can't exercise a moral virtue like liberality (*Nic. Eth.* IV.1) without having some, even considerable, money. The Stoics, by contrast, claim that so long as I order (and express) my preferences in accordance with my nature and universal nature, I will be virtuous and happy, even if I do not actually get the things I prefer. Though these things are typically appropriate to me, rational choice is even more appropriate or akin to me, and so long as I have that, then I have perfected my nature. The perfection of one's rational nature is the condition of being virtuous and it is exercising this, and this alone, which is good. Since possession of that which is good is sufficient for happiness, virtuous agents are happy even if they do not attain the preferred indifferents they select.

One is tempted to think that this is simply a misuse of the word ‘happiness’ (or would be, if the Stoics had been speaking English). We are inclined to think (and a Greek talking about *eudaimonia* would arguably be similarly inclined) that happiness has something to do with getting what you want and not merely ordering one's wants rationally regardless of whether they are satisfied. People are also frequently tempted to assimilate the Stoics' position to one (increasingly contested) interpretation of Kant's moral philosophy. On this reading, acting with the right motive is the only thing that is good--but being good in this sense has nothing whatsoever to do with happiness.

With respect to the first point, the Stoic sage typically selects the preferred indifferents and selects them in light of her knowledge of how the world works. There will be times when the circumstances make it rational for her to select something that is (generally speaking) contrary to her nature (e.g. cutting off one's own hand in order to thwart a tyrant). But these circumstances will be rare and the sage will not be oppressed by the additional false beliefs that this act of self-mutilation is a genuinely bad thing: only vice

is genuinely bad. For the most part, her knowledge of nature and other people will mean that she attains the things that she selects. Her conditional positive attitude toward them will mean that when circumstances do conspire to bring it about that the object of her selection is not secured, she doesn't care. She only preferred to be wealthy if it was fated for her to be wealthy. These reflections illustrate the way in which the virtuous person is self-sufficient (*autarkês*) and this seems to be an important component of our intuitive idea of happiness. The person who is genuinely happy lacks nothing and enjoys a kind of independence from the vagaries of fortune. To this extent at least, the Stoics are not just using the word ‘happiness’ for a condition that has *nothing at all* to do with what we typically mean by it. With respect to the second point, the Stoic sage will never find herself in a situation where she acts contrary to what Kant calls inclination or desire. The only thing she unconditionally wants is to live virtuously. Anything that she conditionally prefers is always subordinate to her conception of the genuine good. Thus, there is no room for a conflict between duty and happiness where the latter is thought of solely in terms of the satisfaction of our desires. Cicero provides an engaging, if not altogether rigorous, discussion of the question of whether virtue is sufficient for happiness in *Tusculan Disputations*, book V.

How do these general considerations about the goal of living translate into an evaluation of actions? When I perform an action that accords with my nature and for which a good reason can be given, then I perform what the Stoics call (LS) a ‘proper function’ (*kathêkon*, Arius Didymus, 59B)--something that it "falls to me" to do. It is important to note that non-rational animals and plants perform proper functions as well (Diog. Laert., 59C). This shows how much importance is placed upon the idea of what accords with one's nature or, in another formulation, "activity which is consequential upon a thing's nature." It also shows the gap between proper functions and morally right actions, for the Stoics, like most contemporary philosophers, think that animals cannot act morally or immorally--let alone plants.

Most proper functions are directed toward securing things which are appropriate to nature. Thus, if I take good care of my body, then this is a proper function. The Stoics divide proper functions into those which do not depend upon circumstances and those that do. Taking care of one's health is among the former, while mutilating oneself is among the latter (Diog. Laert., 59E). It appears that this is an attempt to work out a set of prima facie duties based upon our natures. Other things being equal, looking after one's health is a course of action which accords with one's nature and thus is one for which a good reason can be given. However, there are circumstances in which a better reason can be given for mutilating oneself--for instance, if this is the only way you can prevent Fagin from compelling you to steal for him.

Since both ordinary people and Stoic wise men look after their health except in very extraordinary circumstances, both the sage and the ordinary person perform proper functions. A proper function becomes a fully correct action (*katorthôma*) only when it is perfected as an action of the specific kind to which it belongs, and so is done virtuously. In the tradition of Socratic moral theory, the Stoics regard virtues like courage and justice, and so on, as knowledge or science within the soul about how to live. Thus a specific virtue like moderation is defined as "the science (*epistêmê*) of what is to be chosen and what is to be avoided and what is neither of these" (Arius Didymus, 61H). More broadly, virtue is "an expertise (*technê*) concerned with the whole of life" (Arius Didymus, 61G). Like other forms of knowledge, virtues are characters of the soul's commanding faculty which are firm and unchangeable. The other similarity with Socratic ethics is that the Stoics think that the virtues are really just one state of

soul (Plutarch , 61B, C; Arius Didymus, 61D). No one can be moderate without also being just, courageous and prudent as well--moreover, "anyone who does any action in accordance with one does so in accordance with them all" (Plutarch, 61F). When someone who has any virtue, and therefore all the virtues, performs any proper function, he performs it in accordance with virtue or virtuously (i.e. with all the virtues) and this transforms it into a right action or a perfect function. The connection here between a perfect function and a virtuous one is almost analytic in Greek ethical theorizing. Virtues just are those features which make a thing a good thing of its kind or allow it to perform its function well. So, actions done in accordance with virtue are actions which are done well. The Stoics draw the conclusion from this that the wise (and therefore virtuous) person does everything within the scope of moral action well (Arius Didymus, 61G). This makes it seem far less strange than it might at first appear to say that virtue is sufficient for happiness. Furthermore, because virtue is a kind of knowledge and there is no cognitive state between knowledge and ignorance, those who are not wise do everything equally badly. Strictly speaking, there is no such thing as moral progress for the Stoics (if that means progress *within* morality), and they give the charming illustration of drowning to make their point: a person an arm's length from the surface is drowning every bit as surely as one who is five hundred fathoms down (Plutarch, 61T). Of course, as the analogy also suggests, it is possible to be closer or farther *from* finally being able to perform proper functions in this perfected way. In that sense, progress is possible.

We are finally in a position to understand and evaluate the Stoic view on emotions, since it is a consequence of their views on the soul and the good. It is perhaps more accurate to call it the Stoic view of the passions, though this is a somewhat dated term. The passions or *pathê* are literally ‘things which one undergoes’ and are to be contrasted with actions or things that one does. Thus, the view that one should be ‘apathetic,’ in its original Hellenistic sense, is not the view that you shouldn't care about anything, but rather the view that you should not be psychologically subject to anything--manipulated and moved by *it*, rather than yourself being actively and positively in command of your reactions and responses to things as they occur or are in prospect. It connotes a kind of complete self-sufficiency. The Stoics distinguish two primary passions: appetite and fear. These arise in relation to what appears to us to be good or bad. They are associated with two other passions: pleasure and distress. These result when we get or fail to avoid the objects of the first two passions. What distinguishes these states of soul from normal impulses is that they are "excessive impulses which are disobedient to reason" (Arius Didymus, 65A). Part of what this means is that one's fear of dogs may not go away with the rational recognition that this blind, 16 year old, 3 legged Yorkshire terrier poses no threat to you. But this is not all. The Stoics call a passion like distress a *fresh* opinion that something bad is present (Andronicus, 65B): you may have been excitedly delighted when you first saw you'd won the race, but after a while, when the impression of the victory is no longer fresh, you may calm down. Recall that opinion is assent to a false impression. Given the Stoics' view about good and bad, as against merely indifferent things, the only time that one should assent to the impression that something bad is present is when there is something which might threaten one's virtue, for this and this alone is good. Thus all passions involve an element of false value-judgement. But these are false judgements which are inseparable from physiological changes in the pneuma which constitutes one's commanding faculty. The Stoics describe these changes as shrinkings (like fear) or swellings (like delight), and part of the reason that they locate the commanding faculty in the heart (rather than the head, as Plato in the *Timaeus* and many medical writers did) is that this seems to be where the physical sensations which accompany passions like fear are manifested.

Taking note of this point of physiology is surely necessary to give their theory any plausibility. From the inside a value-judgement--even one like "this impending dog bite will be bad"--might often just not feel like such an emotional state as fear. But when the judgement is vivid and so the commanding faculty is undergoing such a change, one can readily enough see that the characteristic sensations might inexorably accompany the judgement.

Another obvious objection to the Stoic theory is that someone who fears, say pigeons, may not *think* that they are dangerous. We say that she knows rationally that pigeons are harmless but that she has an irrational fear. It might be thought that in such a case, the judgement which the Stoics think is essential to the passion is missing. Here they resort to the idea that a passion is a fluttering of the commanding faculty. At one instant my commanding faculty judges (rightly) that this pigeon is not dangerous, but an instant later assents to the impression that it is and from this assent flows the excessive impulse away from the pigeon which is my fear. This switch of assent occurs repeatedly and rapidly so that it appears that one has the fear without the requisite judgement but in fact you are making it and taking it back during the time you undergo the passion (Plutarch, 65G).

It is important to bear in mind that the Stoics do not think that all impulses are to be done away with. What distinguishes normal impulses or desires from passions is the idea that the latter are excessive and irrational. Galen provides a nice illustration of the difference (65J). Suppose I want to run, or, in Stoic terminology, I have an impulse to run. If I go running down a sharp incline I may be unable to stop or change direction in response to a new impulse. My running is excessive in relation to my initial impulse. Passions are distinguished from normal impulses in much the same way: they have a kind of momentum which carries one beyond the dictates of reason. If, for instance, you are consumed with lust (a passion falling under appetite), you might not do what under other circumstances you yourself would judge to be the sensible thing.

Even in antiquity the Stoics were ridiculed for their views on the passions. Some critics called them the men of stone. But this is not entirely fair, for the Stoics allow that the sage will experience what they call the good feelings (*eupatheiai*, Diog. Laert. 65F). These include joy, watchfulness and wishing and are distinguished from their negative counterparts (pleasure, fear and appetite) in being well-reasoned and not excessive. Naturally there is no positive counterpart to distress. The species under wishing include kindness, generosity and warmth. A good feeling like kindness is a moderate and reasonable stretching or expansion of the soul presumably prompted by the correct judgement that other rational beings are appropriate to oneself.

Criticisms of the Stoic theory of the passions in antiquity focused on two issues. The first was whether the passions were, in fact, activities of the rational soul. The medical writer and philosopher Galen defended the Platonic account of emotions as a product of an irrational part of the soul. Posidonius, a 1st c. BC Stoic, also criticised Chrysippus on the psychology of emotions, and developed a position that recognized the influence in the mind of something like Plato's irrational soul-parts. The other opposition to the Stoic doctrine came from philosophers in the Aristotelian tradition. They, like the Stoics, made judgement a component in emotions. But they argued that the happy life required the *moderation* of the passions, not their complete extinction. Cicero's *Tusculan Disputations*, books III and IV take up the

question of whether it is possible and desirable to rid oneself of the emotions.

Influence

The influence of Stoicism on Greek and Roman culture was enormous. Zeno, the first head of the school, had a statue raised to him in Athens at public expense. The inscription read, in part:

> Whereas Zeno of Citium, son of Mnaseas, has for many years been devoted to philosophy in the city and has continued to be a man of worth in all other respects, exhorting to virtue and temperance those of the youth who came to him to be taught, directing them to what is best, affording to all in his own conduct a pattern for imitation in perfect consistency with his teaching ... (Diog. Laert. 7.10-11, tr. Hicks)

Of course the citizens of Athens couldn't have honoured Zeno for a life lived in consistency with his philosophical principles unless the content of those principles was known to the general public. Since the Stoics gathered, discussed and taught philosophy in a public place, the general import of their philosophy was widely known. Stoicism became a "popular philosophy" in a way that neither Platonism nor Aristotelianism ever did. In part this is because Stoicism, like its rival Epicureanism, addressed the questions that most people are concerned with in very direct and practical ways. It tells you how you should regard death, suffering, great wealth, poverty, power over others and slavery. In the political and social context of the Hellenistic period (where a person could move between these extremes in very short order) Stoicism provided a psychological fortress which was secure from bad fortune. Historians of philosophy earlier in this century regarded this as a mark against Hellenistic philosophy generally. The notion was that philosophy peaked with Plato and Aristotle and then degenerated into the popular "feel good" philosophy of the Hellenistic period and did not approach its earlier glory again until Plotinus. It may be true that the lack of political autonomy in the Greek city states made the ideal of the self-sufficient Stoic sage appear more relevant and desirable. But even if the philosophy suited the times, the Stoics and Epicureans provided arguments for their view which still have interest for us who live in a social and political context that is quite different. (Or perhaps not so different. I suppose it depends on how pessimistic you are about the possibilities for self-determination for individuals and small communities in the age of globalization.)

At the political level, the Antigonid dynasty (which ruled Greece and Macedon from shortly after the death of Alexander to 168 BC) had connections with the Stoic philosophers. Antigonus Gonatas was alleged to have been a pupil of Zeno of Citium. He requested that Zeno serve as the tutor to his son, Demetrius, but Zeno excused himself on the ground that he was too old for the job. The man he sent instead, Persaeus, was deeply involved in affairs at court and, according to some sources, died in battle at Corinth in the service of Antigonus. Another Hellenistic strong-man, Cleomenes of Sparta, had the Stoic philosopher Sphaerus as one of his advisors. The reforms instituted in Sparta (including the extension of citizenship to foreigners and the redistribution of land) were seen by some as a Stoic social reform, though it is less clear that it was anything other than an instrument of power for Cleomenes. (See Plutarch's *Life of Cleomenes*.) Peter Green takes a rather more cynical view of the matter (p. 248 ff), but

Green is perhaps unduly hard on Stoicism generally.

In 155 BC Athens sent a delegation of three philosophers (Stoic, Academic skeptic, and Peripatetic) on an embassy to Rome--no Epicurean was included, perhaps because Epicureans refused on principle to participate in public affairs. Their teachings caused a sensation among the educated. The Skeptic Carneades addressed a crowd of thousands on one day and argued that justice was a genuine good in its own right. The next day he argued against the proposition that it was in an agent's interest to be just in terms every bit as convincing. This dazzling display of dialectical skill, together with the deep seated suspicion of philosophical culture, generated a conservative backlash against all Greek philosophers led by Marcus Porcius Cato (the Censor). By 86, however, Rome was ready to receive Greek philosophy with open arms. It was natural that an ambitious and well off Roman like Cicero should go and study at the philosophical schools in Athens and return to popularise Greek philosophy for his less cosmopolitan countrymen. Epicureanism tended to be favored in the ranks in Rome's military, while Stoicism appealed more to members of the Senate and other political movers and shakers. Many Roman politicians at least adopted the high moral tone of Stoicism according to which only virtue is a genuine good, while money, health and even life itself are simply preferred indifferents. Roman political figures associated with Stoicism include Cato the Younger and Scipio Aemilianus (though some of the claims made in earlier scholarship about Greek philosophy and culture and the Scipionic Circle are now regarded with some suspicion). Marcus Brutus (the friend of Cicero who took part in the murder of Julius Caesar) professed Stoicism but was not above engaging in loan-sharking (hence the joke that he was a man of high principles and even higher interest). Pompey thought it sufficiently important to look in on the Stoic philosopher Panaetius of Rhodes in his comings and goings. Octavian (who became Augustus) had a Stoic tutor. Among the Roman emperors, the Stoic philosopher Seneca was the advisor of Nero. Helvidius Priscus advertised himself as a Stoic. When he rather unwisely criticised the Emperor Vespasian in the Senate, he was executed and all the philosophers were excluded from Rome as trouble makers. Under Domitian, they were banished from all of Italy. Clearly the worst of the Roman emperors had no use for people who did not regard death as the greatest of evils! The hostility of the Empire did not last long. Hadrian (117-138) was a friend of Greek philosophy and saw to it that his relative and his successor Antoninus' heir, Marcus Aurelius, had an education which included it. The latter's *Meditations* are still a good read, even if you know nothing about Stoicism but especially if you do. Marcus atoned in effect for Rome's sins against philosophy by establishing ‘professorships’ in the four schools of philosophy in Athens and other cities in 176. In spite of this, Stoicism as a philosophical movement in its own right nearly disappears after the second century.

The influence of Stoicism on the subsequent history of philosophical and religious thought is hard to evaluate directly. The tradition of theories of natural law in ethics seems to stem directly from Stoicism. (Compare Cicero, *de Legibus* I, 18 with later writers like Aquinas in *Summa Theologica* II, 2, q. 94.) Christian theologians were certainly receptive to some of the elements of Stoicism. There was even a forged correspondence between St Paul and Seneca. (That it could ever have been thought genuine tells us something.) Augustine, alas, chose to follow the Stoics rather than the Platonists (his usual allies among the philosophers) on the question of animals' membership in the moral community (*City of God* 1.20). Medieval and Renaissance philosophers were acquainted with Stoicism chiefly through the writings of Seneca and Cicero. The influence of Stoicism on Medieval thought has been considered by

Verbeke and Colish. I know of no study on the impact of Stoicism on Renaissance and early modern thought.

Select Bibliography

Collections of primary texts

- A. A. Long and D. N. Sedley, *The Hellenistic Philosophers* 2 vols (Cambridge, 1987) [Vol. 2 contains an extensive bibliography of scholarly books and articles.]
- B. Inwood and L. Gerson, *Hellenistic Philosophy* 2nd ed. (Indianapolis, 1997) [This volume is cheaper than Long and Sedley, but it lacks the valuable commentary that LS provide. On the other hand, Inwood and Gerson give you more texts on Pyrrhonism.]

Descartes' Epistemology

René Descartes' approach to the theory of knowledge plays a prominent role in shaping the agenda of early modern philosophy. It continues to effect (some would say "infect") the way problems in epistemology are conceived today. Students of philosophy (in his own day, and in the history since) have found the distinctive features of his epistemology to be at once attractive and troubling; features such as the emphasis on method, the role of epistemic foundations, the conception of the doubtful as contrasting with the warranted, the sceptical arguments of the First Meditation, and the *cogito ergo sum*--to mention just a few that we shall consider.

Depending on context, Descartes thinks that different standards of warrant are appropriate. The context for which he is most famous, and on which the present treatment will focus, is that of investigating First Philosophy. The *first*-ness of First Philosophy is (as Descartes conceives it) one of epistemic priority, referring to the matters one must "first" confront if one is to succeed in acquiring systematic and expansive knowledge.

---

1. Knowledge as normative, internalist, and

methodist

1.1. Cartesian knowledge is *normative*.

In recent epistemologies, it is increasingly fashionable to conceive of knowledge in terms that leave little (or no) room for epistemic responsibility. The processes leading to knowledge *happen to* the subject via organs and faculties, much as do circulation of blood, digestion of food, and the like. Such processes (cognitive or otherwise) may occur more or less reliably. Notions as praise and blame, however, need be no more apropos to the reliability of cognitive processes than to that of non-cognitive processes.

In contrast, Descartes regards the categories of praise and blame as quite appropriate to epistemology. Where the acquisition of knowledge is concerned--the philosopher's knowledge, at any rate--one is obliged to withhold assent except when warranted. Judgments grounded in shoddy evidence are conducive to error and thus merit blame, even when the judged matter is true. Among the aims of epistemology, accordingly, is to identify epistemic duties the following of which will ensure error-free judging.

Granting that *ought* implies *can*, normative accounts presuppose some degree of voluntary control over those actions we're duty-bound to perform (or to restrain from performing). In keeping with this, Descartes holds that epistemic warrant or justification (unlike circulation and digestion) is the willful result of a dutiful, reflective mind; specifically, warrant occurs only where there is a systematic withholding of assent, except when prescribed, and a careful directing of attention towards prescribed matters. In the course of the *Meditations*, Descartes purports to reveal both prescriptions.

1.2. Cartesian knowledge is *internalist*.

Where warrant is understood as a normative concept, the would-be knower needs cognitive access to the factors by which warrant is rendered. The jargon of "internalism" and "externalism" is often applied here, but an adequate characterization of the internalism-externalism distinction is difficult and beyond our aims. According to a construal that will serve our purposes, a theory of justification is internalist insofar as it requires that the justifying factors grounding knowledge claims are accessible to the knower's consciousness. On this construal, Descartes is a *thorough-going* internalist.

Descartes thinks it a straightforward consequence of 17th century mechanist doctrine that requisite cognitive access can come only by means of ideas (conscious states of mind). To use a metaphor Descartes is fond of, evidence of the sort relevant to the internalist is directly present to the mind's eye--it is "intuited" with mental vision. To the extent that we have cognitive access to that which is directly present to our literal eyes (and other organs of physiology), it is by means of ideas. As Descartes conceives the task of acquiring knowledge, the would-be knower must begin with the data of consciousness (the *internal* world) and then somehow build up to (hopefully expansive) knowledge wholly on the basis of such data. The problem of so expanding our knowledge to include even the

external world is among the central epistemological problems of 17th and 18th century philosophy.

1.3. Cartesian knowledge is *methodist*.

How is the epistemologist to proceed in identifying candidates for knowledge? A distinction will prove useful--that between particularist and methodist responses to this question. The *particularist* is apt to presuppose the credibility of our prima facie intuitions regarding particular items of knowledge, and then use these intuitions to help identify more general epistemic duties. The *methodist*, on the other hand, is apt to hold that our prima facie intuitions are unstable and unreliable; that we ought to begin with a method to help us arrive at settled, reflective intuitions as to which particular knowledge claims are credible.

Famously, Descartes is in the methodist camp. Those who haphazardly "direct their minds down untrodden paths" are sometimes "lucky enough in their wanderings to hit upon some truth," but "it is far better," writes Descartes, "never to contemplate investigating the truth about any matter than to do so without a method" (*Rules* 4, AT 10:371). Though it's prima facie palpable that the earth is unmoved, and that ordinary objects (as tables and chairs) *are* just as they *seem*, the newly emerging mechanist doctrines of the 17th century have it that such matters are in fact false. Such cases underscore the unreliability of our prima facie intuitions and the need for a method to help us distinguish these seductive though false matters from genuine truth.

In the dialectic of the First Meditation, Descartes confronts common sense particularism in an effort to show (among other things) that our prima facie intuitions are in need of revision. (As the narrative unfolds, the common sense perspective is often intermingled with that of Aristotelian scholasticism, the prevailing philosophical system in the schools--a system that was common sense oriented in terms of its credulous trust in sense perception.) At the first level of the dialectic, while speaking on behalf of common sense, the meditator-spokesperson (hereafter referred to as the "meditator") appeals to the seeming obviousness of claims as "that I am here, sitting by the fire, wearing a winter dressing-gown, holding this piece of paper in my hands, and so on"--particular matters "about which doubt is quite impossible," or so it would seem (AT 7:18). In response (and at each level of the dialectic), Descartes invokes his own methods to show that the prima facie obviousness of such particular claims is insufficient to meet the burden of proof to which we're epistemically obliged.

2. Descartes' methods: foundationalism and doubt

Of his own methods, Descartes writes:

> Throughout my writings I have made it clear that my method imitates that of the architect. When an architect wants to build a house which is stable on ground where there is a sandy topsoil over underlying rock, or clay, or some other firm base, he begins by digging out a set of trenches from which he removes the sand, and anything resting on or mixed in with the sand, so that he can lay his foundations on firm soil. In the same way, I began by taking everything that was doubtful and throwing it out, like sand ... (Replies 7, AT 7:537)

As suggested by these remarks, Descartes' two principal methods--foundationalism and doubt--are integrated. Since he holds that matters that are prima facie obvious, or self-evident, often turn out false, and since the method of foundationalism depends on an ability to avoid such error when identifying the foundations, a complement method is required if the search for unshakable foundations is to succeed. In the present Section, we consider both of Descartes' methods, making liberal use of his architectural metaphor.

2.1. Foundationalism.

The central insight of foundationalism is that a system of epistemic justification can be fashioned after the manner of a structurally sound house. Such a house might owe its unshakability to two features: a firm *foundation* and a well-anchored *superstructure* consisting of tightly linked support beams firmly grounded into the foundation. Likewise, where warrant is construed in terms of unshakable certainty, a system of knowledge might emerge from two parallel features: a foundation of unshakably certain first principles, and a superstructure of further claims anchored into the foundation by means of unshakably certain inference. Among its considerable alleged benefits, foundationalism provides the means for a potentially indefinite expansion of one's stock of knowledge, from relatively meager beginnings. This is especially significant where there are few first principles.

(It's worth noting that foundationalism, as here characterized, presupposes a conception of truth that involves more than coherence. If relations of coherence exhausted the notion of truth, judgments as to the truth of first principles could not be justified (qua first principles), nor could inference be justification *preserving* as opposed to justification *conferring*.)

A paradigmatic example of a foundationalist system is Euclid's geometry. Euclid begins with a foundation of first principles--his definitions, postulates, and axioms or common notions--on which he then bases a superstructure of further propositions. Descartes' own designs for metaphysical knowledge are inspired by Euclid's system: "Those long chains composed of very simple and easy reasoning, which geometers customarily use to arrive at their most difficult demonstrations, had given me occasion to suppose that all the things which can fall under human knowledge are interconnected in the same way" (*Discourse* 2, AT 6:19). Though it would be misleading to characterize the constructive component of the *Meditations* as straightforwardly fashioned after the manner of the geometers, Descartes does think it *can* be reconstructed as such, and he expressly does so at end of the Second Replies--providing a

"geometrical" exposition of his central constructive steps, under the following headings: *definitions*, *postulates*, *axioms or common notions*, and *propositions* (AT 7:160ff).

As alluded to above, the *Meditations* contains a destructive component that Descartes likens to the architect's preparations for laying a foundation. Though the component finds no analogue in the method of the geometers, Descartes looks to hold that it is needed because of unique problems associated with the discovery of first principles in metaphysical inquiry. The discovery of Euclid's first principles (some of them, at any rate) is comparatively unproblematic: claims as that *things which are equal to the same thing are also equal to one another* (Euclid's first axiom) wear their truth on their sleeve. In metaphysics, however, our analyses might reveal first principles that are in conflict with preconceived opinions deriving from the senses.

> The difference is that the primary notions which are presupposed for the demonstration of geometrical truths are readily accepted by anyone, since they accord with the use of our senses. Hence there is no difficulty there, except in the proper deduction of the consequences, which can be done even by the less attentive, provided they remember what has gone before. ... In metaphysics by contrast there is nothing which causes so much effort as making our perception of the primary notions clear and distinct. Admittedly, they are by their nature as evident as, or even more evident than, the primary notions which the geometers study; but they conflict with many preconceived opinions derived from the senses which we have got into the habit of holding from our earliest years, and so only those who really concentrate and meditate and withdraw their minds from corporeal things, so far as possible, will achieve perfect knowledge of them. (Replies 2, AT 7:156-57)

(Note: Descartes uses ‘perceive’/‘perception’ (*percipio*/*perceptio*) with much wider scope than is the current practice in philosophy: for Descartes, to perceive *X* is, roughly, to be aware of *X*.)

Among Descartes' persistent themes is that such preconceived opinions can have the effect of obscuring our mental vision; that where there are disputes about first principles, it is not "because one man's faculty of knowledge extends more widely than another's, but because the common notions are in conflict with the preconceived opinions of some people who, as a result, cannot easily grasp them"; whereas, "we cannot fail to know them when the occasion for thinking about them arises, provided that we are not blinded by preconceived opinions" (*Prin*. 1.49-50, AT 8a:24). These "preconceived opinions" must be "set aside," says Descartes, since doing so "is wholly necessary in order to lay the first foundations of philosophy" (May 1643, AT 8b:37). Unless they are set aside, we're apt to regard, as bona fide first principles, the mistaken (though prima facie obvious) sensory claims that particularists find attractive. Again, what could be more palpable than that the earth is unmoved? (Indeed, defenders of common sense have even proposed that "the consent of ages and nations, of the learned and unlearned, ought to have great authority with regard to first principles" (Reid 1785, 6.4), perhaps unwittingly making the case that the scholastic doctrine that the earth is unmoved be regarded as a first principle.)

Not only do preconceived opinions interfere with the search for first principles, Descartes thinks they hinder our ability to generate foundationalist superstructure:

> [A]lthough the proofs I employ here are in my view as certain and evident as the proofs of geometry, if not more so, it will, I fear, be impossible for many people to achieve an adequate perception of them, both because they are rather long and some depend on others, and also, above all, because they require a mind which is completely free from preconceived opinions and which can easily detach itself from involvement with the senses. (*Dedicatory Epistle* for *Meditations*, AT 7:4)

Though the method of foundationalism brilliantly allows for the expansion of knowledge from meager beginnings, the method is incomplete if prejudices thwart our ability to identify the foundations. To help "set aside" these preconceived opinions, Descartes devises a second method--the method of doubt.

(We should add that there has been a history of controversy surrounding Euclid's fifth postulate--the parallel postulate. Some have taken the worries, here, as suggesting intractable problems for any endeavor to discover unshakably certain foundations.)

2.2. Methodological doubt.

Descartes opens the First Meditation asserting the need "to demolish everything completely and start again right from the foundations" (AT 7:17). Whereas, in the architectural metaphor, we can think of tractors and bulldozers as the tools of demolition, the tool of epistemic demolition is sceptical doubt. Tractors undermine literal ground; doubt undermines epistemic ground. Descartes' aim, however, is not that of "the sceptics, who doubt only for the sake of doubting," but instead "to reach certainty--to cast aside the loose earth and sand so as to come upon rock or clay" (*Discourse* 3, AT 6:28-29). In our consideration of the method of doubt, we begin by addressing a few misunderstandings; we then focus on how the *universality* and *hyperbole* of doubt are intended to impede the corrupting influence of preconceived opinion.

Misconceptions about the method abound. Two of these are illustrated in a passage from the pragmatist Peirce:

> We cannot begin with complete doubt. We must begin with all the prejudices which we actually have when we enter upon the study of philosophy. These prejudices are not to be dispelled by a maxim [viz. the maxim that the philosopher "must begin with universal doubt"], for they are things which it does not occur to us *can* be questioned. Hence this initial skepticism will be a mere self-deception, and not real doubt ... A person may, it is true, in the course of his studies, find reason to doubt what he began by believing; but in that case he doubts because he has a positive reason for it, and not on account of the Cartesian maxim. Let us not pretend to doubt in philosophy what we do not doubt in our hearts. (1955, 228f)

One misconception is in supposing that universal doubt is intended to result from the mere effort to

adhere to the maxim--as if by sheer effort of will. Quite to the contrary, Descartes introduces sceptical arguments precisely in acknowledgement that, where it does not occur to us that our judgments can be questioned, we need some prompting; we need to be provided with reasons for doubt on which to reflect. Descartes writes:

> I did say that there was some difficulty in expelling from our belief everything we have previously accepted. One reason for this is that before we can decide to doubt, we need some reason for doubting; and that is why in my First Meditation I put forward the principal reasons for doubt. (Replies 5, appendix, AT 9a:204)

A further misconception has it that the intended attitude of doubt need involve the kind of sincerity that Peirce characterizes as a "doubt in our hearts." Distinguish (what I'll call) a *hypothetical* from a *sincere* doubt. Merely hypothetical doubt involves recognition that one's warrant is undermined by a sceptical hypothesis that one regards as extravagant (but not unthinkable). As such, a merely hypothetical doubt need not undermine one's inclination to assent. In contrast, sincere doubt involves recognition that one's warrant is undermined by a sceptical hypothesis that one regards as plausible. Sincere doubt does undermine one's inclination to assent, and only it involves "doubt in our hearts" (as it were). The misconception is in supposing that Descartes' method requires a sincere doubt as opposed to a merely hypothetical doubt. Hypothetical doubt is in fact sufficient to induce recognition that one's confidence is not unshakably firm as is required for the foundations of knowledge. Moreover, it is clear that Descartes regards his hyperbolic doubts as merely hypothetical. He concludes the Synopsis of the *Meditations* by noting that "no sane person has ever seriously doubted" many of the matters that are called into question, such as the existence of the external world. (Rather, he says the primary aim is to establish issues of epistemic priority.) And subsequent to introducing his most extravagant doubt, he concedes that the preceding opinions it undermines remain "much more reasonable to believe than to deny" (AT 7:22).

A related misconception has Descartes calling not merely for doubt, but for disbelief or dissent. Gassendi, e.g., misreads Descartes as urging us to "consider everything as false" (Objs. 5, AT 7:257-58). But surely the spirit of Descartes' invocation to doubt (even if not always its letter) is that, due to the importance of unshakable foundations, we are to "hold back [our] assent from opinions which are not completely certain and indubitable just as carefully as [we] do from those which are patently false" (Med. 1, AT 7:18).

Yet another misconception has it that the universality of doubt renders inert Descartes' own sceptical hypotheses, since they are dubious in every case. Yet since the motivation for the method is to avoid building on dubious/shakable foundations, the scope of universal doubt need not encompass the sceptical hypotheses themselves, as opposed merely to *every* candidate for knowledge (without exception). And since the doubt required by the method is merely hypothetical, the sceptical hypotheses need not seem plausible in order to serve as tools of demolition--"there may be reasons which are strong enough to compel us to doubt, even though these reasons are themselves doubtful, and hence are not to be retained later on" (Replies 7, AT 7:473-74).

These are by no means the only misconceptions about the method of doubt. Even barring such misconception, Descartes admits that "the usefulness of such extensive doubt is not apparent at first

sight," adding that "its greatest benefit lies in freeing us from all our preconceived opinions" (Synopsis, AT 7:12). Further appeal to the architectural metaphor will help to elucidate how the *universality* and *hyperbole* of Descartes' doubt (two features that he consistently emphasizes) are supposed to help us to "set aside" the preconceived opinions apt to obscure the search for first principles.

That doubt is to be *universal* has two aspects: it is to be applied *without exception*, and it is to be applied *collectively rather than piecemeal*. The latter deserves further comment. The requirement that doubt be collective rather than piecemeal is intended in part to prevent a pseudo-firmness that might otherwise result from the supportive influence that judgments have on one another. Suppose an architect attempted to secure the structural stability of a house by renovating it in piecemeal fashion, rather than by means of a universal demolition followed by a complete rebuilding. A potential problem looms in that, roughly in proportion with the number of boards one binds together (other things equal), a structure will seem increasingly sturdy--via a mass-coherence-induced-pseudo-firmness. Imagine our architect moving from one support beam to another, checking each one for sturdiness even while the whole structure remains intact. This piecemeal procedure is apt to lead her to confuse the stability of mass-coherence with that of bedrock-grounding. Indeed, such a procedure might well exhibit an aircraft carrier as resting on unshakable foundations, even though it is (in the relevant sense) nothing more than a massive raft--grounded in nothing, perhaps drifting aimlessly. Likewise, where one's web of preconceived opinion is sufficiently massive and coherent, a procedure of attempting to shake individual such opinions, in piecemeal fashion, while allowing the rest of one's web to remain intact, is apt to exhibit a great many falsehoods as seeming to be quite firm/sure. Universal doubt is intended to avoid this kind of *pseudo*-firmness. If one first disassembles the various support beams from one another before testing their shakability, the difference between mass-coherence-induced-pseudo-stability and bedrock-grounded-stability is more perspicuous. Descartes is supposing that the same benefit is realized when building epistemic structures: by first razing the existing structure in its entirety, one is more likely to hit on first principles whose firmness is not mass-coherence-induced.

In the Seventh Replies, Descartes offers yet another metaphor to illustrate the benefit of the universality requirement in preventing the corrupting influence that judgments can have on one another.

> Suppose [an inquirer] had a basket full of apples and, being worried that some of the apples were rotten, wanted to take out the rotten ones to prevent the rot spreading. How would he proceed? Would he not begin by tipping the whole lot out of the basket? And would not the next step be to cast his eye over each apple in turn, and pick up and put back in the basket only those he saw to be sound, leaving the others? In just the same way, those who have never philosophized correctly have various opinions in their minds which they have begun to store up since childhood, and which they therefore have reason to believe may in many cases be false. They then attempt to separate the false beliefs from the others, so as to prevent their contaminating the rest and making the whole lot uncertain. Now the best way they can accomplish this is to reject all their beliefs together in one go, as if they were all uncertain and false. They can then go over each belief in turn and re-adopt only those which they recognize to be true and indubitable. (Replies 7, AT 7:481)

Turning our attention to Descartes' emphasis on a *hyperbolic* doubt, again the requirement is intended to prevent a pseudo-firmness that might otherwise result when attempting to identify first principles. Remarks by Gassendi make him a useful foil:

> There is just one point I am not clear about, namely why you did not make a simple and brief statement to the effect that you were regarding your previous knowledge as uncertain so that you could later single out what you found to be true. ... This strategy made it necessary for you to convince yourself by imagining a deceiving God or some evil demon who tricks us, whereas it would surely have been sufficient to cite the darkness of the human mind or the weakness of our nature. (Objs. 5, AT 7:257-58)

The architectural metaphor is again helpful. Suppose our architect is vigilant in meeting the first requirement--a universal demolition. Even so, she is apt to confound firm dirt with genuine bedrock if she is not using heavy-duty demolition tools. Indeed, she's apt to rebuild on the very same ground that, prima facie, seemed immovable when the original edifice was built. Descartes thinks there's a nearly irresistible urge to regard as immov*able* the comfortable ground which has, for a lifetime, been unmov*ed*. In the absence of powerful demolition equipment, Descartes' own project thus threatens to amount to no more than an exercise in foundationalist rebuilding on a given (preconceived), unquestioned foundation--a serious concern, in view of the proclivity of his scholastic readers to regard the questioning of ancient and divine authorities as tantamount to heresy. As Descartes writes, in response to Gassendi:

> Is it really so easy to free ourselves from all the errors which we have soaked up since our infancy? Can we really be too careful in carrying out a project which everyone agrees should be performed? ... most people, although verbally admitting that we should escape from preconceived opinions, never do so in fact, because ... they reckon that nothing they have once accepted as true should be regarded as a preconceived opinion. (Replies 5, AT 7:348)

Just as light-duty gardening tools are incapable of uncovering bedrock (*as* bedrock), Descartes needs to provide his readers with heavy-duty demolition gear (i.e. hyperbolic sceptical arguments) if the method is to succeed in preventing the confounding of cherished prejudices with unshakable foundations.

Hence the importance of a universal, hyperbolic doubt to the larger effort to apply foundationalism to metaphysical inquiry. Indeed, Descartes regards the sceptical/destructive component as of such importance to the success of his larger project that he recommends we "devote several months" to the First Meditation alone (Replies 2, AT 7:130). Of course, there is no guarantee, at the outset, that a careful procedure of doubt will achieve the intended result. There are a number of plausible, failed outcomes: (i) perhaps there are no unshakable truths of the sort the method is intended to reveal; or, even granting that there are, (ii) perhaps Descartes' sceptical hypotheses are, though hyperbolic, nonetheless too weak to clear away the prejudices obscuring bedrock; or, even granting that they are sufficiently heavy-duty, (iii) perhaps the meditator will look in all the wrong places for bedrock. On the other hand, if the method does in fact reveal some unshakably certain matters--even in the face of the most hyperbolic doubt that we're capable of contriving--then Descartes thinks that such matters are the stuff of knowledge if anything is:

where our "conviction is so firm that it is impossible for us ever to have any reason for doubting what we are convinced of, then there are no further questions for us to ask: we have everything that we could reasonably want" (Replies 2, AT 7:144-45).

The propriety of Descartes' (oft-criticized as being too high) burden of proof is elucidated by analogy to criminal law. Consider two desiderata of our criminal court system: to convict *all* the guilty, and to convict *only* the guilty. As one raises the burden of proof imposed on the prosecution, the prospects of achieving the first desideratum are decreased; the prospects of achieving the second desideratum are increased. The burden can thus be raised or lowered in accordance with the desideratum one wishes to emphasize. The implications are clear for epistemologists who share the following two desiderata: to warrant *all* the true, and to warrant *only* the true. Descartes places a premium on achieving the second desideratum at all costs--a good method is such that following it ensures that "one will never take what is false to be true" (*Rules* 4, AT 10:371-72). Given this priority, it is appropriate to impose a maximally high burden of proof on the inquirer--we "cannot possibly go too far" in the application of doubt (Med. 1, AT 7:22).

In view of this high burden of proof, it emerges that a requirement of knowledge (as Descartes conceives it) is *full* indefeasibility (i.e. full immunity to doubt): one's conviction must be "so firm that it is impossible for us ever to have any reason for doubting" (Replies 2, AT 7:144); "so strong that it can never be shaken" (24 May 1640, AT 3:65), not even in the face of the most hyperbolic of doubts which might be contrived by the sceptic. The effect may be to limit the eventual stock of knowledge, but the brand of knowledge worthy of the philosopher, as opposed to that appropriate for the mundane affairs of daily life, calls for high standards (cf. Replies 2, AT 7:149). Hereafter, I refer to this rigorous brand of knowledge that Descartes seeks (what he calls *scientia*) as Knowledge (uppercase ‘K’).

Further reading: On foundationalism: for Descartes' treatment, see *Discourse*, First Meditation, and Seventh Objections and Replies; for its treatment by ancients, see Euclid (1956) and Aristotle (*Posterior Analytics*); by interpreters of Descartes, see Sosa (1997a) and Van Cleve (1979). On Cartesian inference (there are disputes as to what "certain inference" (my term) comes to, for Descartes), see Descartes' *Rules* (bearing in mind that the he never finished this work, much less published it, and some of the doctrines there are at odds with his published writings); by commentators, see Gaukroger (1989) and Hacking (1980). On methodological doubt: for Descartes' treatment, see *Rules*,*Discourse*, First Meditation, and Seventh Replies; by commentators, see Frankfurt (1970), Garber (1986), Williams (1983), and Wilson (1978). For a contemporary application interestingly similar to Descartes' treatment of doubt vis-à-vis first principles, see Rawls (1971) on reflective equilibrium. A discussion of the relation between the methods of doubt and foundationalism is somewhat incomplete without consideration of another distinction of method, that between analysis and synthesis. On the analysis-synthesis distinction: see the Second Replies (AT 7:155ff); see also Galileo (1967, 50f), Arnauld (*L'Art de Penser*, 4.2-3), Curley (1986), and Hintikka (1978). On the indefeasibility (and other conditions) of Knowledge/*scientia*, see Newman and Nelson (1999).

3. First Meditation sceptical arguments

Of his sceptical arguments, Descartes says he "could not have left them out, any more than a medical writer can leave out the description of a disease when he wants to explain how it can be cured" (Replies 3, AT 7:172). Among the aims of an accurate sceptical diagnosis is to reveal the comparative shakability of various kinds of judgments--so as to expose which kinds are more (and less) suitable as materials for building enduring Knowledge. Towards this aim, Descartes' diagnosis unfolds from the least hyperbolic doubt (that which undermines the fewest kinds of judgments) to the most hyperbolic doubt. In what follows, we first consider his treatment of doubts motivated by reflection on dreaming. We then consider his most powerful doubt, a doubt motivated by reflection on the veracity of our cognitive faculties.

3.1. Dreaming Doubts.

Historically, there are two distinct dream-related skeptical doubts. The one doubt undermines the judgment that one is *presently* awake--call this the Now Dreaming Doubt. The other doubt undermines the judgment that one is *ever* awake (i.e. in the way normally supposed)--call this the Always Dreaming Doubt. A textual case can be made on behalf of either formulation (or both) being raised in the *Meditations*. We'll not attempt to settle this interpretive dispute here, though we will discuss both.

Both kinds of dream doubt appeal to some version of the thesis that the experiences we take as dreams are (at their best) qualitatively similar to the experiences we take as waking--call this the Similarity Thesis. The Similarity Thesis may be formulated in a variety of strengths. Indeed, disputes as to *how similar* the experiences of the dreaming-kind are to those of the waking-kind have raged for more than two millennia. The tone of the debate suggests that the degree of qualitative similarity may vary across individuals (or, at least, across their *recollections* of dreams). Granting such variation, dreaming doubts that appeal to weaker versions of the Similarity Theses are apt (all other things equal) to persuade more people. Without attempting, here, to settle the interpretive issue of how strong a Similarity Thesis Descartes intends to advance, let's consider a textually defensible formulation that errs on the weak side. The relatively weak thesis I have in mind is this: that the qualitative features of the experiences we take as dreams are sufficiently similar to those of the experiences we take as waking, as to render it *not unthinkable* that waking-quality features should be reproduced in a dream: "every sensory experience I have ever thought I was having while awake I can also think of myself as sometimes having while asleep" (Med. 6, AT 7:77). This version of the Similarity Thesis is endorsable by those who never recollect dreams that seem (on hindsight) qualitatively indistinguishable from the experiences they take as waking; indeed, it's endorsable even by those who simply do not remember their dreams to any significant degree. Descartes' own meditator, however, appears to be someone who remembers dreams of sufficient qualitative similarity to have fooled him while having them: "As if I did not remember other occasions when I have been tricked by exactly similar thoughts while asleep" (Med. 1, AT 7:19).

This weak Similarity Thesis is sufficient for Descartes' purposes. Recall that his method only requires a hypothetical doubt. As long as it is *not unthinkable* that waking-quality experiences should be reproduced

in a dream, then Descartes thinks we're unable to meet the burden of proof requisite for Knowledge--"there are never any [*unshakably*] *sure signs* by means of which being awake can be distinguished from being asleep" (Med. 1, AT 7:19; italics added). Even if one is *very confident* of being able to distinguish dreaming from waking, Descartes thinks this level of confidence is not *so* high as to constitute warrant.

(Much to-do is often made over whether dreaming arguments are self-refuting. The worry is that Similarity Theses, on which such arguments are based, must presuppose that we already know which experiences are dreams and which are waking, in order to assess their comparative quality; this, however, is precisely the distinction that dreaming arguments purport to undermine. Descartes preempts this debate by couching his claims in terms of experiences we *think* of as dreams, those we *think* of as waking, those we *remember* as dreams, and so on.)

We're now in position to generate straightaway the Now Dreaming Doubt: since there are no unshakably sure signs of being awake, for all I Know I'm now dreaming. It's *not unthinkable*, even if I don't believe it. The sceptical consequences of this admission are not insignificant. The further judgments that are called into doubt include all those in which my confidence is shaken on the hypothesis that I'm *now dreaming*--e.g., the judgment that I'm now "holding this piece of paper in my hands." It's not unthinkable that, in a few moments, I'll awaken to the reality that I have no hands. Descartes is not denying the truth of such claims, as to what one is holding in one's hands. He's not even denying that we know them (small 'k', the sense appropriate for practical matters). He's questioning whether we have an unshakable certainty as is requisite for the foundations of Knowledge.

Descartes appears to hold that, from the very same Similarity Thesis, together with a further assumption, the more powerful sceptical result can be generated, namely the Always Dreaming Doubt. The further assumption is that, for all we Know, the processes producing the experiences we take as waking are no more veracious than those producing the experiences we take as dreams. As Descartes writes:

> [E]very sensory experience I have ever thought I was having while awake I can also think of myself as sometimes having while asleep; and since I do not believe that what I seem to perceive in sleep comes from things located outside me, I did not see why I should be any more inclined to believe this of what I think I perceive while awake. (Med. 6, AT 7:77)

The aim of the Always Dreaming Doubt is not to undermine our confidence that we're now awake; nor to question whether there are significant differences between the experiences we categorize as waking and those we categorize as dreaming. Instead, the aim is to undermine our confidence that experiences in the waking category need be produced by external objects. In both categories of experience, our (internalist relevant) cognitive access extends only to the productive *result*, but not to the productive *process*. On what basis, then, do we suppose that external objects play any more a role in producing the experiences in the waking category than those in the dreaming category? It is not unthinkable that "there may be," says the meditator, "some other faculty not yet fully known to me, which produces these ideas without any assistance from external things; this is, after all, just how I have always thought ideas are produced in me when I am dreaming" (Med. 3, AT 7:39). Granting, then, that we are not *unshakably certain* that our "waking" experiences are produced by external objects, *all* of our experiences might be dreams *of a sort*.

The sceptical consequences of this Always Dreaming Doubt are considerably more potent: if we are not unshakably certain that external objects contribute to the production of our "waking" ideas of them, then (thinks Descartes) we are not unshakably certain that there even *are* any such external objects. Our best evidence for the existence of an external world of tables and chairs, and the like, comes from our preconceived opinions as to the role of external objects in producing our ideas of them.

> All these considerations are enough to establish that it is not reliable judgement but merely some blind impulse that has made me believe up till now that there exist things distinct from myself which transmit to me ideas or images of themselves through the sense organs or in some other way. (Med. 3, AT 7:39-40)

The two dreaming doubts are parasitic on the same Similarity Thesis, though their sceptical consequences differ. The Now Dreaming Doubt invokes the *universal conceivability of delusion*: for any one of my sensory experiences, it's not unthinkable that the experience is delusive. The Always Dreaming Doubt invokes the *conceivability of universal delusion*: it's not unthinkable that all my sensory experiences are delusions (say, from a God's-eye perspective).

3.2. Meta-Cognitive Doubts.

Though dreaming doubts undermine a significant number of Knowledge claims, Descartes regards them as only moderately hyperbolic. His most hyperbolic doubt undermines everything the weaker doubts do, and more. Some readers might have thought to ask, "What's left to undermine?" The meditator proposes a response: "whether I am awake or asleep, two and three added together are five, and a square has no more than four sides. It seems impossible that such transparent truths should incur any suspicion of being false." (Med. 1, AT 7:20) Descartes' next doubt is intended to defeat even these claims.

(It's tempting to read Descartes as holding that only *a priori* judgments (i.e. in the post-Kantian sense) survive dreaming doubts--that the eventual foundations of Knowledge will be exclusively *a priori*. It emerges in the Second Meditation, however, that *a posteriori* judgments (as, e.g., concerning the present contents of consciousness) can be among our epistemic best (cf. §5.3 below). It would be more accurate to say that Descartes regards dreaming doubts as having their most damaging undermining impact on judgments of external sense.)

Suppose that our cognitive equipment is flawed and our intellectual faculties are no more reliable than a broken calculator--that we're "wired" (as it were) to compute even simple matters in error. In that case, even those matters that seem most evident (as e.g. those surviving dreaming doubts) might well be false notwithstanding their apparent status as supremely evident. According to Descartes, "the most serious doubt [arises] from our ignorance about whether our nature might not be such as to make us go wrong even in matters which seemed to us utterly evident" (*Prin*. 1.30, AT 8a:16). If we do not have unshakable certainty as to the perfect reliability of our cognitive equipment, observes Descartes, then there is nothing so evident as to escape doubt. Call this doubt about the reliability of our cognitive faculties Meta-

Cognitive Doubt (MCD).

(Note: If the very credibility of our cognitive equipment is in doubt, how *could* we ever gain Knowledge by means of such equipment? Descartes thinks this is what makes hyperbolic doubt so insidious, and why we should regard his eventual solution as so brilliant.)

Lest the reader suppose that even (mere) hypothetical doubt should not be pressed *this* far, Descartes presents a dilemma intended to motivate MCD. Either the design of our cognitive faculties ultimately traces to an all-powerful creator, or it does not. Assuming it does, then for all we Know this omnipotent creator might be a "malign genius" who intentionally designed us with cognitive flaw; a creator this powerful "could have given me a nature such that I was deceived even in matters which seemed most evident" (AT 7:36). On the other hand, given the opposite assumption (as to the omnipotence of the creator), we're no better off--as Descartes explains in the First Meditation:

> Perhaps there may be some who would prefer to deny the existence of so powerful a God rather than believe that everything else is uncertain. ... yet since deception and error seem to be imperfections, the less powerful they make my original cause, the more likely it is that I am so imperfect as to be deceived all the time. (AT 7:21).

Today's reader is likely to try blocking the second horn of dilemma--appealing to a natural selection account, perhaps even forgiving Descartes for not having the benefit of Darwinian theory. But natural selection accounts guarantee, at best, that an organism is *as fit* as the local competition--a result that does not preclude our having cognitive flaw.

The typical reader in Descartes' own day would have instead tried to block the first horn of the dilemma--appealing to then-standard doctrines about the nature of God, as being not only omnipotent but also omnibenevolent: "God would not have allowed me to be deceived in this way, since he is said to be supremely good" (Med. 1, AT 7:21). Anticipating this move, Descartes poses the so-called problem of evil, as applied to error: "if it were inconsistent with [God's] goodness to have created me such that I am deceived all the time, it would seem equally foreign to his goodness to allow me to be deceived even occasionally; yet this last assertion cannot be made" (ibid.). This reductio ad absurdum is supposed to raise doubts as to whether the existence of an omnipotent and omnibenevolent creator is compatible with the undisputed occurrence of (at least) occasional error. And so, this kind of effort to block MCD fails, that is unless the reader already has an unshakably certain solution to the problem of evil.

(A common interpretive mistake is to suppose that, according to Descartes, it would take an omnipotent evil genius in order to undermine our confidence in our epistemic best. Descartes' handling of the above dilemma, along with a perusal of the various texts in which he discusses his radical doubt (cf. AT 3:64-65, 7:21, 7:36, 7:70, 7:77, 8a:6, 8a:9-10, 8a:16), shows that the evil genius plays an ancillary role to the more fundamental worry about cognitive flaw.)

Having reflected on the dilemma, Descartes' meditator states: "I have no answer to these arguments, but

am finally compelled to admit that there is not one of my former beliefs about which a doubt may not properly be raised; and this is not a flippant or ill-considered conclusion, but is based on powerful and well thought-out reasons" (Med. 1, AT 7:21).

Doubt is now both *hyperbolic* and *universal*. Since Descartes regards the refutation of MCD as essential to epistemic warrant, it emerges that a requirement of Knowledge is that the would-be Knower have an unshakable confidence in the perfect reliability of his cognitive equipment. In §5.2, we return to a consideration of MCD and the *indirect* manner in which it calls matters into doubt.

4. Cogito ergo sum

Famously, Descartes holds that the occurrence of thought guarantees the existence of a thinker. A version of this insight appears in every published work in which he treats scepticism--unlike the canonical slogan, '*cogito ergo sum*' ('*je pense, donc je suis*', 'I think therefore I am'). As illustrated early in the Second Meditation, the purported insight has it that though the existence of my body is subject to doubt, the existence of me--qua *thinker*--looks to withstand even the most hyperbolic of doubts: let the evil genius "deceive me as much as he can, he will never bring it about that I am nothing so long as I think that I am something" (AT 7:25). The very attempt to doubt one's own existence turns out self-stultifying: every such effort *is* an occurrence of thought; in turn, the occurrence of thought requires a thinker, albeit only a minimally construed thinker. Descartes regards the *cogito* (as I shall refer to it) as the "first and most certain of all to occur to anyone who philosophizes in an orderly way" (*Prin*. 1.7, AT 8a:7).

The *cogito* has generated an enormous literature--both pro and con. Though the relevant issues are far too numerous and difficult to address here in a systematic way, a few points of clarification might help to preclude some of the philosophic and interpretive mistakes that have ensnared many a critic. I'll restrict my observations concerning the *cogito* to its treatment by Descartes in contexts of systematic doubt.

First, a first-person formulation is essential to the success of the *cogito*. Third-person claims, such as "Icarus thinks," or even "Descartes thinks," are not unshakably certain--not for me, at any rate; only the occurrence of my own thought has a chance of resisting hyperbolic doubt. There are a number of passages in which Descartes refers to a third-person version of the *cogito*, but none of these occur in the context of trying to establish categorically the existence of a particular thinker (as opposed merely to the conditional existence of whatever thinks).

Second, the *cogito* is intended to involve the occurrence of *cogitatio* (i.e. cogitation or thinking, or

consciousness more generally). Any mode of thinking will do: doubt, understanding, affirmation, denial, volition, imagination, sensation, or the like (cf. Med. 2, AT 7:28). Non-cogitative occurrences, on the other hand, will not work. For instance, it won't suffice to reason that "I exist since I am walking," because hyperbolic doubt calls into question the existence of my legs. A simple revision, as "I exist since it *seems* I'm walking," restores the anti-sceptical potency (cf. Replies 5, AT 7:352).

A caveat is in order. That Descartes rejects the indubitability of such formulations, as those that presuppose the existence of body, commits him to nothing more than an epistemological distinction, but not yet an ontological distinction (not to mention a real, or substantial distinction), between mind and body. Indeed, on the heels of the *cogito*, Descartes has his meditator say:

> And yet may it not perhaps be the case that these very things which I am supposing to be nothing [e.g., "that structure of limbs which is called a human body"], because they are unknown to me, are in reality identical with the "I" of which I am aware? I do not know, and for the moment I shall not argue the point, since I can make judgements only about things which are known to me. (Med. 2, AT 7:27)

Third, and related to this last quotation, is that Descartes' reference to an "I" (*ego*), in the "I think" (*cogito*), is not intended to presuppose the existence of a *substantial self*. Indeed, in the very next sentence following the initial statement of the *cogito*, the meditator says: "But I do not yet have a sufficient understanding of what this ‘I’ is, that now necessarily exists" (Med. 2, AT 7:25). What function, then, does the "I" serve in the evidential claim "I think"? Many a critic has complained that in referring to the "I" Descartes begs the question, since he presupposes what he intends to establish in "I exist." Bertrand Russell objects that "the word ‘I’ is really illegitimate"; that Descartes should have, instead, stated "his ultimate premiss in the form ‘there are thoughts’." As Russell adds, "the word ‘I’ is grammatically convenient, but does not describe a datum." (1945, 567) Accordingly, "there is pain" and "I am in pain" have different contents, and Descartes is entitled only to the former.

On behalf of Descartes, it seems that such objections fail to consider fully the *subjective* character of experience. There surely *is* something more to the experience of pain than what "there is pain" conveys. The additional feature is the *subject* of the pain, a subjective character that minimally includes a *point-of-view*. If we take Descartes to be using ‘I’ to designate this subjective character of consciousness--but not *yet* designating anything like a substantial self (as Descartes' express qualifications indicate he intends)--then there is no question begging: rather than being smuggled in, the "I"-ness of consciousness turns out to be (contra Russell) a primary datum of experience. Taking the "I" in this minimalist, subjective sense, introspection reveals (as Descartes writes) that the various modes of thinking all seem to have "one and the same ‘I’," as their subject (Med. 2, AT 7:28). Of course, for all Descartes' meditator Knows (at this early stage of the inquiry), the "I" might well turn out to be indicative of nothing more than a Humean bundle, or perhaps even a committee of substantial selves. But whatever the eventual outcome, vis-à-vis the ontological status of the self, the "I" can be read as a placeholder for what *is* a primary datum of experience.

Fourth, the necessity of Descartes' claim, that "*I am, I exist*" is true "*whenever it is put forward* by me or

conceived in my mind," can be read as having a performatory aspect. There is no formal inconsistency in the suggestion that I might never have existed. But there is a conceptual repugnance, or what Hintikka calls an "existential inconsistency," in actually having or performing the thought that I--qua subject of my thoughts--do not exist. As such, the certainty of the *cogito* endures only as long as the performance: "for it could be," says the meditator, "that were I totally to cease from thinking, I should totally cease to exist" (Med. 2, AT 7:27).

Fifth, much of the debate over whether the *cogito* is intended to involve inference or simple intuition (roughly self-evidence), rests on one of two kinds of mistake--one interpretive, the other philosophic. The interpretive mistake is in focusing on the absence of an express '*ergo*' ('therefore') in the *Meditations* account: this is surely a mistake, since this is the one place (of his various published treatments of the *cogito*) where Descartes does his reader the favor of elaborating the line of inferential reflection that is left implicit in the comparatively elliptical accounts that include an express '*ergo*' (or '*donc*'). The philosophic mistake is in supposing that the *cogito* must either involve inference or intuition, but not both. There is no inconsistency in the view that the meditator comes to appreciate the persuasive force of the *cogito* by means of inferential reflection, while also holding that his eventual conviction is not grounded in inference. (A common theme among rationalists is that the genesis of assent need not serve as its ground.) Moreover, *what* one intuits might well include an inference (as is widely held of *modus ponens*).

Finally, insofar as the *cogito* does involve inference, many readers of Descartes have worried that the inference is invalid. It is far from clear, however, that a worry this strong is well-founded. In view of its unique (aforementioned) features, the *cogito* is not amenable to a straightforward characterization in first-order logic. Presumably, *formal* validity is a special case of a more general conception of validity (perhaps such, that the denial of a conclusion is inconceivable on the condition of a premise set); otherwise we'd have no means of identifying which forms were valid. That having been said, an inference may be valid even if it is not formally valid.

A final observation about the relation between the *cogito* and Descartes' search for unshakable foundations. We earlier observed (cf. §2) that the method of doubt is intended to complement the method of foundationalism by making possible the identification of bona fide first principles. This observation suggests that the foundations of Descartes' foundationalism need not be prima facie self-evident, a suggestion confirmed by his treatment of the *cogito*. If anything in the *Meditations* is prima facie self-evident, the *cogito* is. But, as the third paragraph of the Second Meditation reveals, Descartes intends that the *cogito* emerges from inferential reflection.

5. Epistemic privilege

The method of doubt promises only to avoid error. Among Descartes' further desiderata is a *positive* criterion--a set of internal marks/criteria the occurrence of which guarantee truth. The *cogito* provides grounds for optimism, in that further reflection on its impressiveness might yield this desideratum.

In the present Section, we first consider Descartes' candidate truth criterion. We then consider the indirect sense in which even the privileged judgments grounded in this candidate criterion are defeasible by means of MCD. Finally, we confront the well discussed doctrine that judgments about the mind are epistemically privileged compared with those about body.

5.1. Our epistemic best: clear and distinct perception.

Descartes opens the Third Meditation by observing that the impressiveness of the *cogito* is owed to its being clearly and distinctly perceived (AT 7:35). Later texts indicate both an epistemic and a psychological benefit of such perception. While in the midst of clear and distinct attention, our evidence is *complete* (i.e. by the lights of our cognitive nature); the perceived matter is *understood* as true (cf. AT 7:36, 7:38, 7:56ff). Moreover, on the occasion of clear and distinct understanding, our assent is compelled--we "cannot but assent to these things, at least so long as" we continue to so perceive them (Med. 5, AT 7:65; cf. 7:36, 7:69). Elsewhere, Descartes defines clarity and distinctness:

> A perception which can serve as the basis for a certain and indubitable judgement needs to be not merely clear but also distinct. I call a perception "clear" when it is present and accessible to the attentive mind--just as we say that we see something clearly when it is present to the eye's gaze and stimulates it with a sufficient degree of strength and accessibility. I call a perception "distinct" if, as well as being clear, it is so sharply separated from all other perceptions that it contains within itself only what is clear. (*Prin.* 1.45, AT 8a:21-22)

He adds that "a concept is not any more distinct because we include less in it; its distinctness simply depends on our carefully distinguishing what we do include in it from everything else" (*Prin.* 1.63, AT 8a:31).

Since our evidentially best ground is clarity and distinctness, if anything will issue as the mark of truth, clarity and distinctness will. It thus emerges as Descartes' candidate truth criterion: "I now seem [*videor*] to be able to lay it down as a general rule that whatever I perceive very clearly and distinctly is true" (Med. 3, AT 7:35). I shall call this general criterion the C&D Rule. The announcement of the candidate criterion is carefully tinged with caution (*videor*), as the C&D Rule has yet to be subjected to hyperbolic doubt. Should it turn out that clarity and distinctness--as ground--is shakable, then, writes Descartes, being grounded in clarity and distinctness "would not be enough to make me certain of the truth of the matter" (ibid.).

5.2. The defeasibility of even our epistemic best.

Notwithstanding its evidential impressiveness, Descartes thinks that matters grounded in clarity and distinctness are defeasible and thus are not (yet) sufficiently warranted for Knowledge. Earlier, we introduced Meta-Cognitive Doubt (MCD). In the Fourth paragraph of the Third Meditation (a passage widely discussed by commentators), the doubt resistance of judgments grounded in clarity and distinctness is measured against MCD. Even these privileged judgments are defeasible, though only in an *indirect* way. During moments of clear and distinct attention, we're incapable of doubt; upon turning our attention away, we're able to entertain doubt by noticing the shakability of our confidence in the reliability of our cognitive equipment.

> But what about when I was considering something very simple and straightforward in arithmetic or geometry, for example that two and three added together make five, and so on? Did I not see at least these things clearly enough to affirm their truth? Indeed, the only reason for my *later* judgement that they were open to doubt was that it occurred to me that perhaps some God could have *given me a nature such that I was deceived even in matters which seemed most evident*. And whenever my preconceived belief in the supreme power of God comes to mind, I cannot but admit that it would be easy for him, if he so desired, to bring it about that I go wrong even in those matters which I think I see utterly clearly with my mind's eye. Yet *when I turn to the things themselves* which I think I perceive very clearly, I am so convinced by them that I spontaneously declare: let whoever can do so deceive me, he will never bring it about that I am nothing, so long as I continue to think I am something; or make it true at some future time that I have never existed, since it is now true that I exist; or bring it about that two and three added together are more or less than five, or anything of this kind in which I see a manifest contradiction. (Med. 3, AT 7:36; italics added)

On a very natural reading of this notoriously difficult passage, Descartes appears to be subjecting even the *cogito* to the indirect doubt invoked by MCD. The plausibility of this reading is bolstered by the very character of MCD: whether our epistemic best states are described as being "directly intuited by the mind's eye," or "revealed by the lights of our cognitive nature" (the *lumen naturale*), or "clearly and distinctly perceived," or the like, such cognitive states *are cognitive*; if the hypothesis of cognitive flaw renders even our cognitive best states subject to hyperbolic doubt, it would seem that the *cogito* is no exception. There is, however, considerable debate about this amongst commentators; indeed, it is widely held that the *cogito* is intended to be immune to *any* form of doubt.

Putting aside the debate about the *cogito*, there is little dispute that Descartes intends that *some* clearly and distinctly perceived matters are subject to MCD. The *indirect* manner of their defeasibility deserves further comment. There are two modes of doubting invoked by Descartes. In some cases, the perceiver may entertain doubt *while attending* to the dubious matter; e.g., I may doubt whether the tower in the distance is square or round, even while attending very carefully to my perception of it (cf. Med. 6, AT 7:76). Call this a *direct* doubt. In other cases, the perceiver is capable of doubt only when *re*directing attention *away* from the perceived matter; e.g., in order to undermine such matters as 2+3=5, the meditator (in the above passage) must turn his attention away from them--a redirecting of attention that

enables him to focus on his lack of confidence in the reliability of his cognitive faculties. Call this an *indirect* doubt.

At the end of §2, we noted that Descartes conceives Knowledge as fully indefeasible. This is to say that he conceives Knowledge as being immune to both direct and indirect doubts. *While* clearly and distinctly attending to a matter, it is not subject to direct doubt; such matters are, however, subject to indirect doubt, so long as one can perform Descartes' most hyperbolic doubt--MCD. Even though such matters are so evidentially impressive that we "see a manifest contradiction" in denying them, this is not yet sufficient warrant for Knowledge, if we're able to doubt the credibility of the cognitive equipment by means of which we apprehend such evidence. In closing the above passage (in the last block quote), Descartes concedes that his indirect doubt (MCD) is "a very slight and, so to speak, metaphysical" doubt, but he adds nonetheless that so long as we're uncertain as to whether a veracious God exists, as opposed to one who endows us with cognitive flaw, we "can never be quite certain about anything else" (AT 7:36).

What next? How are we to make epistemic progress if even our *epistemic best* is subject to hyperbolic doubt? Perhaps the one, seemingly hopeful note is that we're able--even in the face of hyperbolic doubt--to construct anti-sceptical arguments that are psychologically compelling for so long as they are clearly and distinctly perceived (they resist direct doubt). But these same anti-sceptical arguments are then subject to indirect doubt, by MCD, as soon as we turn our attention away from them. On one plausible reading of the anti-sceptical arguments of the Third and Fourth Meditations, Descartes intends that his meditator is "progressing" (by means of psychological compulsion) by attending clearly and distinctly to these arguments--attempting to demonstrate the existence of an all-perfect creator who guarantees the C&D Rule. On this interpretation, however, the anti-sceptical effort would appear to be both Sisyphean (since subject to later, indirect doubts) and circular (since relying on that which he attempts to establish, namely the criterion of clarity and distinctness). In §6 we return to a more detailed consideration of such problems. Before doing so, let's stray a bit from the project of philosophizing "in an orderly way" and consider a Cartesian doctrine that has received much attention in its subsequent history.

5.3. The epistemic privilege of judgments about the mind.

In our natural, pre-reflective condition, Descartes thinks we're apt to confound mind and body in a manner that obstructs our ability to perceive with clarity and distinctness. The confusion is clearly expressed (Descartes would say) in a 1925 essay written by G. E. Moore, "A Defence of Common Sense":

> I begin, then, with my list of truisms, every one of which (in my own opinion) I *know*, with certainty, to be true. ... There exists at present a living human body, which is *my* body. This body was born at a certain time in the past, and has existed continuously ever since ... But the earth had existed also for many years before my body was born ... (1962, 32-33)

In contrast, Descartes writes:

> [I]f I judge that the earth exists from the fact that I touch it or see it, this very fact undoubtedly gives even greater support for the judgement that my mind exists. For it may perhaps be the case that I judge that I am touching the earth even though the earth does not exist at all; but it cannot be that, when I make this judgement, my mind which is making the judgement does not exist. (*Prin*. 1.11, AT 8a:8-9)

The method of doubt is intended to help us appreciate the folly of the commonsensical position--assisting us in recognizing that the perception of our own minds is "prior to" and "more evident" than that of our own bodies. As the *cogito* is supposed to show, Knowledge claims (as Moore's) are subject to doubts to which claims about the existence of our own cogitation is immune. "Disagreement on this point," adds Descartes, comes from "those who have not done their philosophizing in an orderly way"; from those who, while properly acknowledging the "certainty of their own existence," mistakenly "take ‘themselves’ to mean only their bodies"--failing to "realize that they should have taken ‘themselves’ in this context to mean their minds alone" (*Prin*. 1.12, AT 8a:9). Reflection on reasons for doubt helps us ascertain that our own bodies are part of the external world--that our direct cognitive access reaches no further than states of consciousness.

We observed earlier (cf. §3) that a full sceptical diagnosis is intended to reveal the comparative shakability of various kinds of judgments, thereby exposing which kinds are most suitable as the building materials of Knowledge. By way of example, suppose there are two elevators available to you. You have grounds for doubting the integrity of the electrical wiring in the elevator on the left (but not in the elevator on the right); both elevators, however, have a cable of dubious integrity. Under these circumstances, the elevator on the right is clearly more conducive to safety (other things equal). An analogous point holds when comparing judgments about the body and those about the mind: the array of First Meditation doubts reveals that, though both kinds of judgments are subject to doubt at some level, judgments about the mind are subject to less kinds of doubt than those about the body. Our very best judgments of external sense are subject to direct doubt (by dreaming doubts) and to indirect doubt (by MCD); our very best judgments about the mind are subject only to indirect doubt.

This mind-is-better-known-than-body doctrine seems, for Descartes, to be motivated in part by his understanding of the new mechanistic science. As one of its pioneers, he gleaned epistemic consequences for our judgments about body from the mechanical causal story involved in sensory perception, as well as from the new mechanical conception of body. According to Descartes' theory of sensation, our physiological organs and nerves serve as mediating links that stand (spatially and causally) between the tables and limbs (and the like) that we perceive and the brain events that occasion our perceptual awareness of them (cf. *Prin*. 4.196). He thinks mechanism helps explain how non-veridical perception--e.g. dreams of colored tables, and pains in phantom limbs--can be occasioned by physiological processes largely similar to those that occasion veridical perception; indeed, he thinks the Similarity Thesis (cf. §3.1) has scientific support.

> [I]t is the soul which sees, and not the eye; and it does not see directly, but only by means of the brain. That is why madmen and those who are asleep often see, or think they see, various objects which are nevertheless not before their eyes: namely, certain vapours

> disturb their brain and arrange those of its parts normally engaged in vision exactly as they would be if these objects were present. (*Optics*, AT 6:141; cf. Med. 6., AT 7:83ff; *Passions* 26)

Moreover, according to the new science, bodies have no properties that resemble the qualitative features of our conscious experience of them (specifically, what would later be called secondary qualities, as e.g. the *color* "of" a table, and the *pain* "in" one's foot). The famous wax passage (at the end of the Second Meditation) is supposed to help show that our clear and distinct ideas of body include "none of the features" that we arrive at "by means of the senses" (AT 7:30). Sofar as internalist-relevant evidence is concerned, all that sensory experience avails us of is a glimpse of our own minds, a glimpse that largely misrepresents the real properties of external things.

Notwithstanding the undisputed role our nervous systems play in mediating our perception of tables and chairs (and even bracketing that sensory images of tables and chairs bear little resemblance to the supposed scientific image), there is considerable philosophical controversy concerning in what respects sense perception should be regarded as direct/immediate as opposed to indirect/mediated. Since, when looking through a window, say, at a tree, one's perception is *of* or *about* the tree rather than of/about the window, it seems one's perception is *intentionally* direct, and might remain direct even upon adding additional mediating panes of glass. Moreover, the same perception is likely to be *inferentially* direct, in that one's judgments about the tree do not become inferentially (more) complex in virtue of adding mediating panes of glass. Indeed, it would be misleading to characterize the judgment forming process as follows: "Aha, I see that the additional panes of glass are clean, and not tinted, and are thus not corrupting my perception of the tree." In view of such considerations, why would one hold that the mediation of our nervous systems is of epistemological importance?

One kind of reply open to Descartes lies in the evidentially relevant difference between the mediation of our nervous systems and that in our example of adding panes of glass: the former case, unlike the latter, is not such that we *could* compare our sensory perception of a tree both with and without such mediation in order to check for a corrupting influence. This means that the mediation of our nervous systems renders our sensory apprehension of tables and chairs as--essentially--*evidentially incomplete*. By means of our senses, we could never have Knowledge as to whether our sensory ideas accurately represent the external objects they purport to be of. The evidential problem thus far characterized holds even for materialist ontologies and is intensified with dualism. Some version or other of the mind-is-better-known-than-body doctrine is widely embraced in the 17th century.

On a slightly different note, it is generally overlooked that the mind-is-*better*-known-than-body doctrine is intended to convey a *comparative* rather than a *superlative* thesis. For Descartes, the only superlative state is that of clarity and distinctness: only it is correctly characterized as "our cognitive best"; and only it is regarded as a promising candidate for an infallible criterion of truth. Though the better-known doctrine entails that introspective judgments (i.e. those concerning the present contents of consciousness) are privileged, Descartes regards them as nonetheless subject to error. Even introspective perception--e.g. of occurrent pains and other sensations--must be rendered clear and distinct to be among our cognitive best. Such matters are clearly and distinctly perceivable, writes Descartes,

> provided we take great care in our judgements concerning them to include no more than what is strictly contained in our perception--no more than that of which we have inner awareness. But this is a very difficult rule to observe, at least with regard to sensations. (*Prin*. 1.66, AT 8a:32; cf. 1.68)

Indeed, we do "frequently make mistakes, even in our judgements concerning pain" (*Prin*. 1.67), since "people commonly confuse this perception [of pain] with an obscure judgement they make concerning the nature of something which they think exists in the painful spot and which they suppose to resemble the sensation of pain" (*Prin*. 1.46, AT 8a:22). Not only are introspective judgments error prone, introspective *reports* provide an additional source of error, since we may "attach our concepts to words which do not precisely correspond to real things" (*Prin*. 1.74, AT 8a:37).

Though Descartes is quite clear (as these texts show) as to the fallibility of introspective judgments, contemporary thinkers widely attribute to him a variety of related doctrines that he rejects. Compare the doctrines of the *infallibility* of the mental--roughly, the doctrine that sincere introspective judgments are always true; the *indubitability* of the mental--roughly, that sincere introspective judgments are indefeasible; and *omniscience* with respect to the mental--roughly, that one has Knowledge of every true proposition about one's own present contents of consciousness. (There is some variation in the way these doctrines are formulated in the literature.)

The widespread attribution of such doctrines to Descartes appears to stem from two *Meditations* texts in which he says, of examples of introspective claims, that they *cannot be false* strictly speaking. In each case, however, the larger context suggests a reconciliation of these claims with the fallibility conceded in the above cited passages. The first text (Med. 2) follows immediately on the heels of a reflective procedure of analysis intended to strip away every feature of introspection except that which is clearly and distinctly perceived--the very same procedure to which Descartes alludes, in *Principles* 1.66 (cf. the last block quote). Where the analysis has been run *successfully* (and in context we're to assume that the meditator has been successful), Descartes thinks that there is no room left for an appearance-reality gap: that we "*seem* to see, to hear, and to be warmed" (again, in the context of a successful stripping away) is what "having a sensory perception" just *is,* in the "restricted sense" (i.e. the *mental part* of sense perception) (AT 7:29). The second text that has misled interpreters (Med. 3) can be read as alluding to the very same stripping away procedure, and Descartes carefully adds the following qualification (as to our perception of such ideas): "provided they are considered solely in themselves and I do not refer them to anything else" (AT 7:37). So, in both texts the claimed epistemic privilege is conditional on successfully performing the requisite introspection. Not just any sincere effort at introspection will suffice: the internalist-relevant criterion of success is clarity and distinctness, not sincerity.

One final thought on the subject of epistemic privilege. As has been stressed, clear and distinct perception is *the* superlative epistemic state of privilege. But how are we to be sure that we're in a perceptual state of bona fide clarity and distinctness? As Gassendi complains, Descartes owes us a "method to guide us" as to "when we are mistaken and when not," when we suppose we "clearly and distinctly perceive something" (Objs. 5, AT 7:279). In his reply, Descartes acknowledges the need and adds: "I carefully

provided such a method in the appropriate place, where I first eliminated all preconceived opinions and afterwards listed all my principal ideas, distinguishing those which were clear from those which were obscure or confused" (AT 7:362).

6. Cartesian Circle

Returning to the project of philosophizing "in an orderly way," we left the meditator (at the end of §5.2) seemingly unable to make epistemic progress in the face of hyperbolic doubt. He can construct compelling, anti-sceptical arguments, but they are subject to later, indirect doubt by means of MCD. In his *Principles* treatment, Descartes summarizes the problem:

> The mind, then, knowing itself, but still in doubt about all other things, looks around in all directions in order to extend its knowledge further. First of all, it finds within itself ideas of many things; and so long as it merely contemplates these ideas and does not affirm or deny the existence outside itself of anything resembling them, it cannot be mistaken. Next, it finds certain common notions from which it constructs various proofs; and, for as long as it attends to them, it is completely convinced of their truth. ... But it cannot attend to them all the time; and subsequently, when it happens that it remembers a conclusion without attending to the sequence which enables it to be demonstrated, recalling that it is still ignorant as to whether it may have been created with the kind of nature that makes it go wrong even in matters which appear most evident, the mind sees that it has just cause to doubt such conclusions, and that the possession of certain knowledge [*scientiam*] will not be possible until it has come to know the author of its being. (*Prin.* 1.13, AT 8a:9-10)

(Note: Translations typically obscure the fact that Descartes is careful to use different terms when referring to weaker forms of knowledge/knowing than when referring to the strong form which we're signaling with an uppercase ‘K’ (i.e. *scientia*). In the above passage, for instance, only in that occurrence of "knowledge"-talk that has been expressly marked does Descartes refer to *scientia* as opposed to some weaker concept as *cognitio*.)

Descartes' meditator thus constructs arguments in an effort to show that the "author of his being" did not endow him with a flawed cognitive nature--a seemingly hopeless effort, since these same proofs are

subject to indirect doubt by MCD. Included in the effort is Descartes' Third Meditation proof of the existence of God, and a further proof intended to establish that God guarantees the perfect reliability of the C&D Rule (Med. 4). Both of these proofs present difficult interpretive and philosophic problems that we'll not here consider. In the present treatment, we'll instead focus our attention on the broader line of reasoning which, quite famously, appears to involve circularity--the so-called Cartesian Circle. The apparent circle is defined by two arcs:

> (1) I am certain that God exists only because *I am certain of whatever I clearly and distinctly perceive*.

> (2) *I am certain of whatever I clearly and distinctly perceive* only because I am certain that God exists.

There is wide agreement amongst commentators that Descartes' procedure is not viciously circular in the manner suggested by a bald reading of (1) and (2). There is less agreement, however, both as to how Descartes avoids circularity, and as to what extent his procedure provides a satisfactory solution to the sceptical problem (this, even when granting the exceedingly permissive assumption that the component Third and Fourth Meditation proofs are themselves sound). It would be useful to isolate the issues about which there's fairly general agreement amongst commentators, from those about which there's not. Towards this end, let's first try to show why (1) and (2) misrepresent Descartes' procedure, by exposing an ambiguity in the italicized phrase--some such diagnosis is either explicit or implicit in much of the secondary literature. We'll then be in position to clarify the remaining interpretive problems on which commentators are divided, problems that arise in connection with the Third and Fourth Meditation proofs being subject to indirect doubt.

Both (1) and (2) involve an expression of confidence as to the credibility of clarity and distinctness: *I am certain of whatever I clearly and distinctly perceive*. Call this the Certainty Thesis. The Certainty Thesis turns out to be ambiguous between the following two claims:

> (3) I am certain that *p*, if I clearly and distinctly attend to *p* (and its proof, if any).

> (4) I am certain that the C&D Rule is perfectly reliable, if I clearly and distinctly attend to it and its proof.

The certainty expressed in (3) stems from the evidential impressiveness of clearly and distinctly understood matters (cf. §5.1): "my nature is such that so long as I perceive something very clearly and distinctly I cannot but believe it to be true" (Med. 5, AT 7:69). As such, this certainty does not depend on having established a divine guarantee of the perfect reliability of the C&D Rule; indeed, the certainty of atheist geometers stems from (3).

The claim in (4) is a substitution instance of (3). The consequent of (4) expresses a confidence in the C&D Rule as would result from carefully attending to a supporting demonstration--a demonstration that

Descartes claims an atheist could not produce. Such certainty is derivative of that expressed in (3). Accepting (3), however, does not presuppose a commitment to there being any such demonstration as would provide for the confidence expressed in (the consequent of) (4).

In the ambiguity of the Certainty Thesis lies the key to *dis*solving the Cartesian Circle. Descartes' procedure might at first appear to define the arcs of (1) and (2), but it actually unfolds (in part) as a subtle effort to use the certainty of (3) as a fulcrum on which to lever compelling anti-sceptical arguments in the pursuit of (4). To the extent that the two "arcs" (better: "stages") properly characterize the project, the express statement of the Certainty Thesis has a different sense in each stage. One *can* characterize the first stage by means of (1), so long as the Certainty Thesis is understood as referring to (3). So understood, (1) might be rewritten (though somewhat awkwardly):

> (1′) I am certain that God exists only because (I am certain that *p*, if I clearly and distinctly attend to *p* and its proof).

As for the second stage, one *can* characterize it by means of (2), so long as the express statement of the Certainty Thesis, there, is understood as referring to (4). So understood, (2) might be rewritten (again, somewhat awkwardly):

> (2′) (I am certain that the C&D Rule is perfectly reliable, if I clearly and distinctly attend to it and its proof) only because I am certain that God exists.

Since, according to Descartes, the C&D Rule rests on a divine guarantee, the meditator's eventual, demonstrative confidence in its perfect reliability is parasitic on earlier steps (in connection with (1′)) establishing the existence of God. What prevents circularity is that the proof of the C&D Rule (in connection with (2′)) is not intended to provide for (atheist-available) confidence stemming from (3), nor does the appeal to God (in (2′)) rest on the divinely guaranteed C&D Rule. Naturally, a preferred characterization of the two stages would not use numerically the same express language to signify two, importantly different certainty theses. Making the point by means of (1′) and (2′) amounts to an exercise showing that it is possible (even though misleading) to characterize Descartes' project by means of the express Certainty Thesis in (1) and (2): the two stages, as expressed in (1) and (2), would form a bona fide circle only if the Certainty Thesis had the same sense in both cases; their correct sense is represented by (1′) and (2′), but these do not define a circle.

Granting that Descartes' project is not circular in the manner of (1) and (2), significant problems remain. Since, as already noted, the anti-sceptical proofs (even if non-circular) remain subject to indirect doubt by means of MCD, it is unclear how these proofs are supposed to contribute to a final solution to the sceptical problem. Indeed, it is unclear how they are supposed to provide even for epistemic *progress*: prior to reflection on the proofs of God, clearly and distinctly perceived matters resist direct doubt while being vulnerable to indirect doubt; subsequent to reflection on these same proofs (and granting they are recognized as sound), it appears to remain the case that clearly and distinctly perceived matters resist direct doubt while being vulnerable to indirect doubt. To put the interpretive puzzle in terms of a

comparison that Descartes is fond of, it is unclear in what respect a theist geometer (one who's successfully worked through the *Meditations*) is epistemically advantaged over an atheist geometer. As we've thus far set-up the interpretive issues, it would appear that the theist has no epistemic advantage over the atheist insofar as the best proofs of each are vulnerable to indirect doubt. Yet Descartes is adamant that the atheist does not have Knowledge of the matters he clearly and distinctly perceives, precisely "since no act of awareness that can be rendered doubtful seems fit to be called knowledge [*scientia*]" (Replies 2, AT 7:141).

An obvious desideratum of an adequate interpretation is to avoid this unsavory result. What all existing interpretations share in common is the (implicit) assumption that unless the undermining effects of Descartes' indirect doubt (MCD) are somehow mitigated, there is in principle no way to have the fully indefeasible Knowledge he purports to attain; and no way to account for the alleged epistemic advantage enjoyed by the theist. A useful way of understanding the disagreement amongst interpreters is in terms of how/where they think the mitigation is to occur. The interpretive camps that have emerged rally around two kinds of strategies for mitigating the effects of MCD. Both kinds of strategy achieve a mitigation of MCD by *exempting* a category of judgments from its sceptical reach. The one strategy involves antecedent exemption, the other involves subsequent exemption.

(Note: There are many possible taxonomies of the views in the voluminous literature. I pick this particular taxonomy, since it best clarifies that none of the interpretive efforts thus far succeeds in attributing to Descartes what he should regard as an adequate response to the sceptic. For another recent taxonomy, see Loeb (1992).)

According to interpretations involving *antecedent exemption*, Descartes preempts at the outset the problem of indirect doubt by exempting from MCD a class of first principles. He then constructs his anti-sceptical demonstrations out of steps consisting of items from the exempted class. That each step in a demonstration is exempted from MCD is evidently thought to ensure that the resulting conclusion is also immune, thus allowing Descartes to use a foundationalist architecture to build up to Knowledge. Among the texts that are often cited on behalf of antecedent exemption is a Second Replies passage in which Descartes says, of very "simple" and "transparently clear" matters, including the *cogito* and other axioms, that "we cannot doubt them without at the same time believing they are true; that is, we can never doubt them" (AT 7:145-46)--suggesting that he regards these matters as immune even to indirect doubt.

According to interpretations involving *subsequent exemption*, Descartes initially allows that hyperbolic doubt *is* universal such that even simple axioms are subject to indirect doubt; the exemption then kicks-in later, at the level of superstructure. In short, subsequent to careful reflection on the theistic proofs, further contemplation of MCD no longer moves us to doubt. The claim is not that clear and distinct perception is now immune to indirect doubt. Rather, the interpretation seems to have it that hyperbolic worries (as MCD) are no longer regarded as being of epistemic significance. Interpreters in this camp are impressed by the following, late Fifth Meditation passage:

> Now, however, I have perceived that God exists, and at the same time I have understood that everything else depends on him, and that he is no deceiver; and I have drawn the

> conclusion that everything which I clearly and distinctly perceive is of necessity true. Accordingly, even if I am no longer attending to the arguments which led me to judge that this is true, as long as I remember that I clearly and distinctly perceived it, there are no counter-arguments which can be adduced to make me doubt it, but on the contrary I have true and certain knowledge of it. And I have knowledge not just of this matter, but of all the matters which I remember ever having demonstrated, in geometry and so on. (Med. 5, AT 7:70)

On one recent subsequent exemption account, Descartes is interested in anti-sceptical *reproducibility*: so long as the meditator retains an on-demand ability to reproduce the demonstration of the C&D Rule, it provides him all the anti-sceptical oomph that Descartes thinks one needs for Knowledge. On another subsequent exemption account, Descartes is interested in establishing a mere *reflective coherence* sufficient to induce a general confidence in the reliability of our cognitive equipment: prior to reflecting on the existence and nature of God, we lack this reflective coherence; subsequent to such reflection, we no longer need be troubled by the hyperbolic doubts of the First Meditation.

Significant problems face all exemption strategies. Such declarations of exemption (whether antecedent or subsequent) seem hopelessly arbitrary: there appears to be no principled basis on which to exclude a class of cognitive states (whether axioms or theorems) from a doubt so hyperbolic that it undermines the reliability of our cognitive equipment. Moreover, exemption strategies seem irreconcilable with Descartes' systematic insistence that there can be no atheistic Knowledge: antecedent exemption opens the door for an atheist meditator to build up to Knowledge from a foundation of exempted first principles (since these are equally available to him); subsequent exemption, in fudging on issues of indirect doubt, sets a precedent that arguably allows the atheist meditator to similarly fudge. Finally, exemption strategies are difficult to reconcile with Descartes' somewhat strident claims to being the first philosopher to have decisively refuted the sceptic on the sceptic's own terms--terms that Descartes clarifies as requiring immunity to indirect doubts.

Further reading: (Note: The foregoing discussion is in large part excerpted from Newman and Nelson (1999).) See the Fourth Replies for Descartes' express response to charges of circularity; see the Fifth Meditation, Second Replies, and the letter to Regius (24 May 1640), for texts on his intended, final solution to doubt. For examples of antecedent exemption accounts, see Kenny (1968), (Morris 1973), and Wilson (1978). For examples of subsequent exemption accounts, see DeRose (1992) and Loeb (1992), both of whom offer reproducibility accounts; Frankfurt (1970) and Sosa (1997a and 1997b), both of whom offer reflective coherence accounts; and Curley (1978 and 1993). For an interpretation that involves neither antecedent nor subsequent exemption, see Newman and Nelson (1999). For an anthology devoted largely to the Cartesian Circle, see Doney (1987). For a treatment of the Fourth Meditation contribution to the demonstration of the divine guarantee of the C&D Rule, see Newman (1999).

7. Proving the existence of the external, material

world

Granting that Descartes has laid a theistic foundation for Knowledge--specifically, the divine guarantee of the C&D Rule--he attempts to expand his clear and distinct perception to encompass the existence of the external, material world. The attempt builds on a familiar strategy in the history of philosophy, an appeal to the involuntariness of sensory experience. Let's first consider the familiar strategy and its defect in the face of First Meditation doubt, and then consider Descartes' effort to repair it.

The familiar strategy turns on the following prima facie plausible inference: some of our sensory experiences come to us involuntarily; therefore, they are caused by things external to us.

> I know by experience that these ideas do not depend on my will, and hence that they do not depend simply on me. Frequently I notice them even when I do not want to: now, for example, I feel the heat whether I want to or not, and this is why I think that this sensation or idea of heat comes to me from something other than myself, namely the heat of the fire by which I am sitting. (Med. 3, AT 7:38)

In spite of its seeming plausibility, the inference falls prey to First Meditation doubt.

> Then again, although these [apparently adventitious] ideas do not depend on my will, it does not follow that they must come from things located outside me. Just as the impulses which I was speaking of a moment ago seem opposed to my will even though they are within me, so *there may be some other faculty not yet fully known to me, which produces these ideas without any assistance from external things;* this is, after all, just how *I have always thought ideas are produced in me when I am dreaming*. (Med. 3, AT 7:39; italics added)

The familiar inference presupposes exactly what is in dispute--namely, that our seemingly involuntary ideas are not caused by some hidden faculty of our minds, some unconscious mental component. But according to the Always Dreaming Doubt, what we take as normal, waking experiences might well be another kind of dreaming, whereby the conscious images of "waking" life are fictitious inventions of our minds; such images might well be produced by some unknown, immaterial (internal) faculty. (This unknown faculty hypothesis can also be motivated by the supposition of an evil genius who endowed us with cognitive equipment by which we're inevitably misled.) Thus, as a first step in repairing the familiar argument, Descartes thinks we need to refute the sceptical hypothesis that our involuntary sensory experiences are produced by an unknown, internal faculty.

By the time of the Sixth Meditation, Descartes has new premises at his disposal, premises which he thinks block the unknown faculty scenario. Among the metaphysical theses developed throughout the *Meditations* is that mind and body have distinct essences; that the essence of thinking substance is pure thought/consciousness/awareness, while the essence of body is pure extension. Writes Descartes, "nothing can be in me, that is to say, in my mind, of which I am not aware," and this "follows from the

fact that the soul is distinct from the body and that its essence is to think" (31 Dec. 1640, AT 3:273). This result makes possible the following line of reasoning. Since the essence of mind is awareness, it follows that there can be no hidden mental occurrences--no unconscious happenings of the mind. As such, if the cause of my seemingly involuntary sensory ideas were a faculty in me, I would be aware of this faculty on the occasion of its operations. But I am not aware of the operations of any such faculty. Thus, the cause of the ideas is not in me qua thinking thing. "I proved the existence of material things," says Descartes, "not from the fact that we have ideas of them but from the fact that these ideas come to us in such a way as to make us aware that they are not produced by ourselves" (August 1641, AT 3:428-29). The cause of such ideas

> cannot be in me, since clearly it presupposes no intellectual act [viz. a volition] on my part, and the ideas in question are produced without my cooperation and often even against my will. So the only alternative is that it is in another substance distinct from me ... (Med. 6, AT 7:79)

Granting Descartes his moves thus far, it still remains to be shown that this external cause of our involuntary sensory ideas is a body. There are three possible options. The external cause is (a) corporeal/material substance (just as it seems), (b) some other non-material creature, or (c) God.

> But since God is not a deceiver, it is quite clear that he does not transmit the ideas to me either directly from himself, or indirectly, via some creature ... For God has given me no faculty at all for recognizing any such source for these ideas; on the contrary, he has given me a great propensity to believe that they are produced by corporeal things. It follows that corporeal things exist. (Med. 6, AT 7:79-80)

The inference here is quite troubling to the interpreter: in view of the epistemic duty (emerging from the Fourth Meditation) that we withhold assent except when our perception is clear and distinct, Descartes would appear to be straying from those rigorous standards earlier enforced. The worry is apt. The above line of reasoning does not have the meditator clearly and distinctly perceiving straightaway that option (a) is correct. Rather, he appears to be drawing a roundabout conclusion on the basis of a perception with credentials significantly less impressive than clarity and distinctness; the perception doing the evidential work is said to yield a (mere) "great propensity" to judge that (a) is the correct option.

According to one interpretation (that we'll not here elaborate), Descartes is not in fact straying from his earlier standards. Rather, the Fourth Meditation demonstration of the C&D Rule proceeds by means of steps that license the inference that he is here making. On this reading, in the Fourth Meditation Descartes establishes a divine guarantee of the infallible truth of a judgment, that *p*, whenever (as the above text indicates):

> (i) I am positively inclined to assent to *p*; and
> (ii) I have no faculty/capacity for correction by which I could ascertain that not-*p*.

(There are hard questions, e.g. as to the nature on this inclination, that find no straightforward answers in the texts. As will emerge, Descartes again calls on this same inferential move in his effort to prove that he is not dreaming.)

Even granting this interpretation, potential problems loom. Since the procedure allows that mere propensity/inclination producing perceptions can result in Knowledge, it threatens to prove *too much*. Not only are we "inclined" to judge that corporeal things (in general) exist, we're also inclined to form particular existential judgments, as that *this* table and *that* chair exist; indeed, we're inclined to judge that such bodies have qualitative properties (as color, sound, taste, etc). But Descartes' own mechanist principles entail that bodies have only quantitative properties (primary qualities, as size, shape, motion, etc.). And on the assumption that I'm now dreaming (Descartes has yet to rebut the Now Dreaming Doubt) there might not even *be* any particular bodies quite like those now appearing to me. How, then, does Descartes prevent his argument from establishing these further results that he regards as unwarranted?

In the continuation of the last quoted passage, Descartes qualifies the conclusion of his argument:

> They [bodies] may not all exist in a way that exactly corresponds with my sensory grasp of them, for in many cases the grasp of the senses is very obscure and confused. But at least they possess all the properties which I clearly and distinctly understand, that is, all those which, viewed in general terms, are comprised within the subject-matter of pure mathematics. (Med. 6, AT 7:80)

Issues of interpretation are difficult here. Descartes may hold that the second of the two conditions above--(ii), concerning whether we have a faculty/capacity for correction--is what gives him the proper result without proving too much: since he thinks we do have the ability to ascertain that bodies aren't colored, our "inclination" to suppose they are colored is not conclusive; and since we do have the ability to ascertain whether we are awake (as he later discusses), we'd need to do so before forming Knowledge-worthy judgments as to the *particular* objects around us.

Further reading: See Descartes' *Prin.* 2.1 for a variation of his Sixth Meditation argument. On Descartes' treatment of the problem of the existence of the external, material world, see Friedman (1997), Garber (1992), and Newman (1994). On the respects in which the Sixth Meditation inference draws on Fourth Meditation work, see Newman (1999).

[Return to Section links]

8. Proving that one is not dreaming

As one nears the end of the *Meditations*, Descartes purports to have made astonishing anti-sceptical advances. None of these foregoing results, however, entails that the meditator is awake. It remains to be

shown whether Knowledge extends this far. Descartes confronts the Now Dreaming Doubt in the closing paragraph of the *Meditations*.

It is tempting to read him as offering a *wholly* naturalistic solution to the problem, in the form of a Continuity Test: since continuity with past experiences holds only for one's waking experiences but not for one's dream experiences, checking for the requisite continuity reveals whether one is awake. The following passage can be read as suggesting this litmus test:

> I now notice that there is a vast difference between [being asleep and being awake], in that dreams are never linked by memory with all the other actions of life as waking experiences are. ... But when I distinctly see where things come from and where and when they come to me, and when I can connect my perceptions of them with the whole of the rest of my life without a break, then I am quite certain that when I encounter these things I am not asleep but awake. (Med. 6, AT 7:89-90)

This "solution" prompts two obvious criticisms (both of which were raised by Hobbes, in the Third Objections). First, the solution runs contrary to Descartes' no-atheist-Knowledge thesis: since the Continuity Test involves no appeal to God, it appears, as Hobbes notes, "that someone *can* know he is awake without knowledge of the true God" (AT 7:196). Second, adds Hobbes, it seems one could *dream* the requisite continuity; i.e., one could "dream that his dream fits in with his ideas of a long series of past events," thus undermining the credibility of the Continuity Test (AT 7:195). Let's consider Descartes' reply to both objections.

As to the first, it turns out on closer inspection that the Continuity Test is used in conjunction with a theistic appeal. We saw earlier, in the proof of the external, material world, that Descartes invokes the following (divinely guaranteed) truth rule, namely that *p* is true whenever:

> (i) I am positively inclined to assent to *p*; and
> (ii) I have no faculty/capacity for correction by which I could ascertain that not-*p*.

In the final paragraph of the Sixth Meditation, while confronting the Now Dreaming Doubt, Descartes again appears to invoke this rule. The larger passage opens with the meditator discussing his various faculties for correcting sensory error.

> I can almost always make use of more than one sense to investigate the same thing; and in addition, I can use both my memory, which connects present experiences with preceding ones, and my intellect, which has by now examined all the causes of error. Accordingly, I should not have any further fears about the falsity of what my senses tell me every day; on the contrary, the exaggerated doubts of the last few days should be dismissed as laughable. This applies especially to ... my inability to distinguish between being asleep and being awake. (Med. 6, AT 7:89)

Referring to the worry (that he's dreaming) as exaggerated suggests that condition (i) is met--that he's "positively inclined" to judge that he is awake. As such, he need only to establish condition (ii) and he'll have a divine guarantee of being awake. Thus, says the meditator (speaking of sensory appearances),

> when I distinctly see where things come from and where and when they come to me, and when I can connect my perceptions of them with the whole of the rest of my life without a break, then I am quite certain that when I encounter these things I am not asleep but awake. And I ought not to have even the slightest doubt of their reality if, *after calling upon all the senses as well as my memory and my intellect in order to check them, I receive no conflicting reports from any of these sources*. For *from the fact that God is not a deceiver* it follows that in *cases like these* I am completely free from error. (Med. 6, AT 7:90; italics added)

Central to the inference is the meditator's effort to ascertain the correctness of the judgment towards which he is inclined, by means of his various faculties: the inclination is sufficient to warrant the judgment that he is awake, provided his faculties do not enable him to ascertain that he is instead dreaming. (Elsewhere Descartes remarks that, when "we are asleep and are aware that we are dreaming, we need imagination in order to dream, but to be aware that we are dreaming we need only the intellect"; Replies 5, AT 7:358-59.) The *cases like these* to which Descartes refers look to be those where conditions (i) and (ii) are both satisfied.

There are, then, multiple internalist criteria that Descartes discusses in connection with the Now Dreaming Doubt. Initially (in the First Meditation), the meditator draws the provisional, sceptical conclusion that "there are never any sure [internal] signs by means of which being awake can be distinguished from being asleep" (AT 7:19), a result of reflecting on the qualitative similarity between waking and dreaming (cf. the Similarity Thesis from §3.1). By the end of the Sixth Meditation, following an extended inquiry into dropsy-type error, he notices that we have an ability to cross-check various of our cognitive faculties in order to correct sensory errors that would have an adverse effect on the well-being of the body. This observation leads to the disclosure of the Continuity Test. Though the Continuity Test *is* available to an atheist meditator, this naturalistic criterion--alone--is insufficient to warrant that one is awake. As Descartes says to Hobbes, "an atheist can infer that he is awake on the basis of memory of his past life" (via the Continuity Test), but "he cannot know that this criterion is sufficient to give him the certainty that he is not mistaken, if he does not know that he was created by a non-deceiving God" (Replies 3, AT 7:196). The further internalist criteria to which Descartes thus appeals looks to be (i) and (ii); when combined with the Continuity Test, he thinks this further (divinely guaranteed) truth rule provides justification requisite for Knowledge.

True to form, then, Descartes' procedure does preclude atheistic Knowledge. There are, however, further questions as to how the procedure is supposed to work for the theist. This brings us to the second objection. As Descartes correctly notes, "a dreamer cannot really connect his dreams with the ideas of past events" in the successful manner required by the Continuity Test; yet, as Descartes concedes, the dreamer "may dream that he does" (Replies 3, AT 7:196). This reminds us of the more general problem that plagues internalist epistemologies: if it can *seem* to me that I'm in the requisite criterial state (e.g., the

state of recognizing that I'm passing the Continuity Test), even on occasions when I'm not actually in the requisite state (e.g., I'm merely *dreaming that* I am), how can I rely on how things seem as a guide to truth? (Cf. the objection from Gassendi that we considered at the very end of §5.3.) Unfortunately, Descartes does not elaborate in his reply to Hobbes, and it is not at all clear how an adequate response would go. It is clear, however, that Descartes recognizes that even theists face difficulties in implementing his procedure for determining that one is awake, and he adds the following caveat as his closing remark in the *Meditations*:

> But since the pressure of things to be done does not always allow us to *stop and make such a meticulous check*, it must be admitted that in this human life we are often liable to make mistakes about particular things, and we must acknowledge the weakness of our nature. (Med. 6, AT 7:90; italics added)

Descartes' Modal Metaphysics

Descartes sometimes speaks of things that are possible. He also speaks of eternal and necessary truths that are created by God. One of the interpretive projects that these claims inspire is the construction of a general Cartesian theory of modality. Any such theory of course needs to be sensitive to what Descartes says about possibility and necessity. However, what Descartes says in these instances sometimes appears to be in conflict with pillars of his larger system. For example, Descartes' dualistic ontology is very economical, and any entities that he posits must respect this economy. If he posits possibilities or necessities in a way that his parsimonious system does not allow, then he is helping himself to things to which he is not entitled. Also, Descartes holds that God is omnipotent. If this means that God is so powerful that He can make eternal truths false, then it is not at all clear how they could be necessary. There is an important interpretive issue about how we are to proceed in cases where Descartes makes claims that appear to conflict with his larger systematic commitments. Very generally, if Descartes makes claims about *X*, and if his claims about *X* appear to conflict with his systematic commitment to *Y*, we have a few options. One is that we can attempt to secure a reading of Descartes' claims about *X* that has them squaring with his commitment to *Y*. Another (presumably less attractive) option is that we can conclude that Descartes is not really committed to *Y* or that he does not mean what he says about *X*. Another is that we can interpret Descartes' commitment to *Y* as squaring with his claims about *X*. Descartes' views on modality are touched by many of his other views. Existing interpretations of Descartes on modality turn on how his claims about possibility and necessity are to be understood in light of his larger system.

1. The Analytic Method and Descartes' Views on

Modality

Though Descartes makes a number of claims about possibilities and necessities, not all of them are to be considered in determining his views on modality if we take seriously his view that when doing metaphysics we ought not affirm what we do not clearly and distinctly perceive. Descartes reveals his commitment to this view in a number of places:

> I should like you to remember here that, in matters which may be embraced by the will, I made a very careful distinction between the conduct of life and the contemplation of the truth. As far as the conduct of life is concerned, I am very far from thinking that we should assent only to what is clearly perceived. …But when we are dealing solely with the contemplation of the truth, surely no one has ever denied that we should refrain from giving assent to matters which we do not perceive with sufficient distinctness.[1]

If Descartes holds that when doing strict metaphysics we ought not speak of what we do not clearly and distinctly perceive, a general Cartesian theory of modality should not be sensitive to claims that Descartes makes about possibilities or necessities that are confused.

For reasons having to do with his method, Descartes still makes a number of such claims throughout his corpus. For example, in the First Meditation Descartes entertains a number of possibilities that suggest that our minds might be mistaken about results that seem perfectly evident to us. One such possibility is that we have been created by a supremely good God but that, for reasons unbeknownst to us, our nature is such that we "go wrong every time [we] add two and three or count the sides of a square, or in some even simpler matter" (AT 7:21, CSM 2:14). Another is that we have not been created by God but have "arrived at [our] present state by fate or chance or a continuous chain of events" (AT 7:21, CSM 2:14). A third is that we have been created by a malicious demon (AT 7:22, CSM 2:15). Descartes mentions all of these possibilities to set up his Third Meditation point that until we know what made our minds, we are not in a position to trust them and so not in a position to know anything at all (AT 7:36, CSM 2:25). However, none of these possibilities is a possibility that is a constituent of Descartes' ontology. In the Fifth Meditation, Descartes reveals that a person who has meditated to a sufficient grasp of God's nature understands self-evidently that God exists and did not create our minds defectively:

> …as regards God, if I were not overwhelmed by preconceived opinions, and if the images of things perceived by the senses did not besiege my thought on every side, I would certainly acknowledge him sooner and more easily than anything else. For what is more self-evident than the fact that the supreme being exists, or that God, to whose essence alone existence belongs, exists (AT 7:69, CSM 2:47).

For Descartes, a person who thinks that God is a deceiver or even that there is no such being as God is very confused.

It might seem surprising that Descartes flirts with these confusions at all. When he does so he is just employing his *analytic* method -- what he calls the "best and truest method of instruction…" (Second Replies, AT 7:156, CSM 2:111). Descartes does not hide that he sometimes makes claims early in the *Meditations* that from a later and more sophisticated point of view he will retract. He says,

> The analytic style of writing that I adopted there [in the *Meditations*] allows us from time to time to make certain assumptions that have not yet been thoroughly examined; and this comes out in the First Meditation where I made many assumptions which I proceeded to refute in subsequent Meditations.[2]

Descartes makes these claims because he is trying to teach his metaphysics and because he thinks that his readers will not be in a position to grasp that metaphysics if he only makes claims that are true.[3] Descartes holds that

> All of our ideas of what belongs to the mind have up till now been very confused and mixed up with the ideas of things that can be perceived by the senses. This is the first and most important reason for our inability to understand with sufficient clarity the customary assertions about the soul and God.[4]

In order to maneuver his readers into a position in which they *are* able to understand his metaphysics, Descartes needs to help them to clear up their ideas. If he simply tells us his view, we will hear it in terms of the confused ideas that (on his view) it is imperative we discard. The view that we would walk away with would not be Descartes' view but something else. Descartes therefore opts for a special strategy for presenting his metaphysics. If he is not going package his view by putting it forward unadorned, he will have to embellish it. If we object (as does Gassendi) to this kind of maneuver, Descartes insists that under the circumstances it is only appropriate. He says,

> A philosopher would be no more surprised at such suppositions of falsity than he would be if, in order to straighten out a curved stick, we bent it round in the opposite direction. The philosopher knows that it is often useful to assume falsehoods instead of truths in this way in order to shed light on the truth… (Fifth Replies, AT 7:349-350, CSM 2:242).

The falsehoods that Descartes assumes early in the *Meditations* include his claims about the possibility of God's deception and the possibility of His non-existence. But these are not real possibilities in Descartes' ontology. When Descartes talks about these alleged possibilities, he is not interested in truth. Rather, he is interested in helping his reader to abandon misconceptions. Descartes holds that when doing metaphysics, we ought refrain from making judgments about what we do not clearly and distinctly perceive. Along with anything else that we do not clearly and distinctly perceive, the alleged possibilities of God's deception and His non-existence do not belong in Descartes' ontology.

2. Unactualized Possibles

Descartes is unambiguous that there are some things that we clearly and distinctly perceive to be possible. To Mersenne he speaks of beings whose existence we clearly perceive to be possible (To Mersenne, March 1642, AT 3:544-545, CSMK 211); he also says that God "can bring about everything that I clearly and distinctly recognize as possible" (Fourth Replies, AT 7:219, CSM 2:154). In First Replies he says that

> …we must distinguish between possible and necessary existence. It must be noted that possible existence is contained in the concept or idea of everything that we clearly and distinctly understand; but in no case is necessary existence so contained except in the case of the idea of God.[5]

In addition, he says to Mesland that "our mind is finite and so created as to be able to perceive as possible things which God has wished to be in fact possible."[6] The interpretive issue here is what Descartes is talking about when he speaks in such terms. One interpretation that immediately suggests itself is that Descartes holds that there are things or states of affairs that, though not actual, are counterfactually possible.[7] A number of considerations speak in favor of such a reading. One is that Descartes' view that mind and body are really distinct appears to be the view that minds and bodies that are in fact united can exist apart.[8] Another is that Descartes says that we have clear and distinct perceptions of possible existence and of what is possible, thus making it appear that he holds that God's creatures include not only actuals but also unactualized possibles.[9] Finally, this sort of reading fits Descartes within a long tradition of figures like Scotus and Brandwardine who posit possible being to secure the meaning and reference of claims about things that could be but aren't.[10] If Descartes wants to make claims about unactualized possibles and if he does not want those claims to be non-sensical, unactualized possibles need to have some kind of ontological status in his system.

Descartes may in fact be committed to attributing reality to unactualized possibles, but a few interpretive problems arise if he does. One is that Descartes says elsewhere that unactualized being has no ontological status. In the Third Meditation, he argues that the objective reality of the idea of God cannot have been caused by potential perfections towards which a finite being might be evolving because potentialities are nothing and so have no causal power. He says,

> ... I perceive that the objective being of an idea cannot be produced merely by potential being, which strictly speaking is nothing, but only by actual or formal being. (AT 7:47, CSM 2:32)

If Descartes holds that potential being is nothing, then it is difficult to see how he can include unactualized possibles in his ontology.

Another interpretive problem is that it is difficult to see where possible reality would fit into Descartes' parsimonious dualistic ontology. For Descartes, possibles would be creatures, yet Descartes holds that the only creatures are finite minds and bodies and their modes:

> I recognize only two ultimate classes of things: first, intellectual of thinking things, i.e. those which pertain to mind or thinking substance; and secondly, material things, i.e. those which pertain to extended substance or body. Perception, volition and all the modes both of perceiving and willing are referred to thinking substance; while to extended substance belong size (that is, extension in length, breadth and depth), shape, motion, position, divisibility of component parts and the like.[11]

One category of being in Descartes' ontology is thinking substance (and its modes), and another is extended substance (and its modes). If Descartes' possibles are just created thinking or extended substances, then presumably they are actuals and not possibles. Of course, one might suggest that Descartes' dualism entails that there are two kinds of things -- thinking things and material things -- but that in each of these classes there are substances with actual existence and also substances with possible existence. On such a view, the class of thinking substances (for example) includes thinking substances with actual existence and thinking substances with possible existence. A problem with this view, though, is that Descartes cannot adhere to it if he also adheres to his theory of the conceptual distinction between a substance and its attributes. Descartes holds that all created substances have possible existence and that the existence of a substance is only conceptually distinct from that substance. He says,

> we do not sufficiently distinguish between things existing outside our thought and the ideas of things, which are in our thought. Thus, when I think of the essence of a triangle, and of the existence of the same triangle, these two thoughts, as thoughts, even taken objectively differ modally in the strict sense of the term 'mode'; but the case is not the same with the triangle existing outside thought, in which it seems to me manifest that essence and existence are in no way distinct. The same is the case with all universals. Thus, when I say that Peter is a man, the thought by which I think of Peter differs modally from the thought by which I think of man, but in Peter himself being a man is nothing other than being Peter. (To ***, 1645 or 1646, AT 7:350, CSMK 280-281)

Descartes holds that *in re* a thing's existence is identical to the thing itself. If all creatures have possible existence, then a creature that actually exists has possible existence. If the thing's existence is just identical to that thing itself, then the thing's possible existence is identical to the thing and the thing's actual existence is identical to the thing. That is, a thing's possible existence just is its actual existence.

If Descartes wants to distinguish between possible existence and actual existence, he must abandon his theory of conceptual distinction. If he retains this theory, he has to say that "possible existence" is just another name for actual existence. Descartes actually suggests this equation in a few places. To describe the kind of existence had by creatures, Descartes uses 'possible existence' and 'contingent existence' interchangeably: he sometimes speaks of the beings that depend on God for their existence as having "possible or contingent existence" (Second Replies, AT 7:166, CSM 2:117; *Notae*, AT 8B:361, CSM 1:306), and sometimes he speaks of them as having just "contingent existence" (*Principles* 15, AT 8A:10, CSM 1:198). When he says that creatures have possible *or* contingent existence, he identifies the two kinds of existence: "possible or [*vel*] contingent existence." If contingent existence is just the kind of

existence had by beings that depend for their existence on God's will, then the fact that a thing has possible existence in Descartes' ontology does not suggest that the thing does not actually exist. Such a thing exists, but in a way that has it wholly dependent on God. Descartes suggests exactly this definition of "possible existence" when he contrasts necessary existence with the kind of existence had by creatures in First Replies: unlike necessary existence, the existence had by a creature is marked by the fact that it "has no power to create itself or maintain itself in existence" (AT 7:118, CSM 2:84). It might be that like some of his predecessors Descartes is using 'possible existence' to describe a kind of being had only by actually existing things.[12]

A final worry is whether or not unactualized possibles are allowed by Descartes' commitment to divine simplicity. Descartes embraces the view that a perfectly simple God would have no distinct parts and concludes that

> In God willing and knowing are a single thing in such a way that by the very fact of willing something he knows it and it is only for this reason that such a thing is true. (To Mersenne, 6 May 1630, AT 1:149, CSMK 24)

A philosopher like Leibniz will insist on a distinction between God's understanding and will so as to secure the existence of things in God's understanding that God does not actually create. For Descartes, however, there is no such distinction, and whatever is the object of God's understanding is also the object of his will.[13] Descartes says,

> …in God, willing, understanding, and creating are all the same thing without one being prior to the other even conceptually. (To Mersenne, 27 May 1630, AT 1:152, CSMK 25-26)

What is *not* the object of God's understanding is nothing at all, and what is the object of God's understanding is created and made actual. If Descartes is seriously committed to the identity of God's intellect and will, it is difficult to see how he can also be committed to the existence of unactualized possibles.

There are a number of passages in which Descartes speaks of what is possible. To fix an interpretation of these passages, we can look to a number of different places. One is common-sense. We might argue that any view is crazy that does not admit that there are things that could happen or exist but that do not. Since Descartes is not crazy, what he must mean when he speaks of the possible is unactualized being.[14] Or, we might argue that Descartes is continuing the tradition of thinkers who clearly *do* posit unactualized possibles. If these figures include unactualized being within their ontologies, and if Descartes is building on their work, then (again) Descartes' claims about the possible are about unactualized being. Or, we might attempt to isolate parts of Descartes' system that have a bearing on what "possible" might mean in his system. Parts of this system entail that 'possible existence' is just the actual existence of dependent beings. If by "possible existence" Descartes just means the dependent existence of actually existing creatures, then passages in which Descartes speaks of a thing as being

possible or having possible existence are not evidence that Descartes holds that there are things that could be but are not.[15] Of course, it might just be the case that Descartes has reason to help himself to entities that the rest of his system shuts out.

If Descartes does hold that there are things that could be but are not, his view still demands an important qualification. Descartes of course realizes that in everyday discourse we speak of things that can happen but don't. However, if our understanding of these things is not clear and distinct, and if our understanding of them as possible is not clear and distinct, then Descartes will not introduce them as possibilities. Descartes appreciates that according to common ways of speaking, all kinds of things are possible. He considers this concept of 'possible' after Mersenne introduces it in Second Objections:

> If by 'possible' you mean what everyone commonly means, namely 'whatever does not conflict with our human concepts', then it is manifest that the nature of God, as I have described it, is possible in this sense…. (Second Replies, AT 7:150, CSM 2:107)

Here Descartes might seem to be offering a theory of possibility according to which what it means for something to be possible is just for it to be conceivable.[16] However, this cannot be Descartes' view. Descartes holds that whatever we clearly and distinctly perceive is true and that truth is "the conformity of thought with its object" (To Mersenne, 16 October 1639; AT 2:597, CSMK 139). If a possibility that we are considering is clearly and distinctly perceived, then our clear and distinct perception conforms to reality, and the possibility that we are conceiving is not merely conceptual. Instead, there is also an object to which the clear and distinct perception conforms -- the sort of thing posited by commentators who argue that Descartes holds that God's creation consists not only of actuals but of unactualized possibles. Thus, for any possibility of which we have a conception, if there is no object to which that conception conforms -- that is, if the possibility exists *only* in thought -- the possibility is not clearly and distinctly perceived. Possibilities which exist *only* in thought are not part of Descartes' ontology and so on Descartes' view are not possibilities at all. Descartes' remarks to Mersenne actually bear this out. Descartes is indeed considering the view of possibility as conceivability, but in doing so he is merely acknowledging what "everyone commonly means" by 'possible'. Descartes sometimes speaks of the possible as clearly and distinctly perceived. It is on these passages that any interpretation of Descartes' views on possibility must be built.

3. The Eternal Truths

Descartes is infamous for his doctrine of the divine creation of the eternal truths:

> You ask me by what kind of causality God established the eternal truths. I reply: by the same kind of causality as he created all things, that is to say, as their efficient and total cause. (To [Mersenne], 27 May 1630, AT 1:152, CSMK 25)

On the surface the position is baffling, especially when considered in conjunction with Descartes' view

that God is omnipotent. The author of Fifth Objections, Pierre Gassendi, complained that the view is very difficult to conceive. Descartes' reply is interesting:

> You say that you think it is 'very hard' to propose that there is anything immutable and eternal apart from God. You would be right to think this if I was talking about existing things, or if I was proposing something as immutable in the sense that its immutability was independent of God. But just as the poets suppose that the Fates were originally established by Jupiter, but that after they were established he bound himself to abide by them, so I do not think that the essences of things, and the mathematical truths which we can know concerning them, are independent of God. Nevertheless I do think that they are immutable and eternal, since the will and decree of God willed and decreed that they should be so. Whether you think this is hard or easy to accept, it is enough for me that it is true. (Fifth Replies, AT 7:380, CSM 2:261)

Descartes holds that each and every thing depends on God for its existence and that, as things, eternal truths depend on God as well. One of Gassendi's worries is that if God can do anything and thus can alter any item that He creates, nothing that He creates is immutable.

But this is not the only worry that arises with respect to Descartes' view on eternal truths. There is also a question about whether or not Descartes can account for the necessity that he attributes to them. In at least one place Descartes identifies eternal truths as necessary: he says that "the necessity of these truths does not surpass our knowledge" (To Mersenne, 6 May 1630; AT 1:150, CSMK 25). The worry here is that if they are necessary then it should not be the case that they could have been otherwise. Yet Descartes' commitment to divine omnipotence appears to commit him to this view:

> You ask what necessitated God to create these truths; and I reply that he was free to make it not true that all the radii of the circle are equal -- just as free as he was not to create the world. And it is certain that these truths are no more necessarily attached to his essence than are other created things. (To [Mersenne], 27 May 1630; AT 1:152, CSMK 25)

It appears that something in Descartes' comments about the eternal truths has to give. It might be that, since Descartes is clearly not prepared to adjust his commitment to divine omnipotence, he instead abandons his view that they are necessary.[17] On this view, all eternal truths are inherently contingent because they could have been false, and they could have been false because God could have made their contradictories true. This does not just follow from Descartes' commitment to divine omnipotence; there are also some texts:

> … God cannot have been determined to make it true that contradictories cannot be true together, and therefore… he could have done the opposite.[18]

> I do not think that we should ever say of anything that it cannot be brought about by God. For since every basis of truth and goodness depends on his omnipotence, I would not dare

> to say that God cannot make a mountain without a valley, or bring it about that 1 and 2 are not 3.[19]

On this reading, then Descartes does not really hold that the eternal truths are necessary. If to our rational faculties they appear to be necessary, this is just a function of the makeup of our rational faculties and not of the necessity of the truths themselves.[20]

If Descartes holds that eternal truths are necessary in any robust sense, the latter view has an obvious drawback. A second view is that Descartes holds that eternal truths are necessary, but not necessarily so. On this reading, Descartes' view involves iterated modalities: a number of truths are possibly necessary, but God chooses only some of these possibilities to be the actual necessary truths.[21] One of the passages that supports such a reading is from the already-cited letter to Mesland:

> And even if God has willed that some truths should be necessary, this does not mean that he willed them necessarily; for it is one thing to will that they be necessary, and quite another to will this necessarily, or to be necessitated to will it.[22]

On this reading, Descartes' view is that eternal truths are necessary, but they are not necessarily necessary.

An alternative reading of Descartes' comments on the eternal truths suggests still another interpretation. Jonathan Bennett has pointed out that in some of the key passages in question Descartes does not say that God can make contradictories true but that we should not say that God cannot make contradictories true (Bennett 1994, 653-655). Here Descartes is not saying anything about God's power but about us and what we ought not say. Presumably, Descartes is just invoking his Fourth Meditation rule for judging in these passages.[23] He is clear that when doing metaphysics we ought not affirm what we do not clearly and distinctly understand. Since we do not come close to a clear and distinct understanding of what it would be for one and two to add up to something other than three, and since we do not understand God's being unable to do something, the prospect that God cannot make 1 and 2 not add to 3 is hopelessly confused. Accordingly, we ought not speak of it. This analysis applies also to the important passage in the Mesland letter. Immediately after saying that God can make contradictories true together, Descartes takes it back: "… even if this be true, we should not try to comprehend it, since our nature is incapable of doing so." Descartes' claim that God can make contradictories true is something that we ought not affirm when doing metaphysics and thus something that should have no bearing on our interpretation of Descartes' system. Here Descartes may just be speaking in the language of faith and devotion in an attempt to gesture at God's perfection.

This last view handles very easily the passages in which Descartes says that we ought not say of impossibilities that God cannot bring them about. The view also squares nicely with the view that Descartes is an actualist. However, there are still passages in which Descartes says that God can bring about impossibilities (and not just that we ought not say that He cannot). For example, there is his claim to Mersenne that God was free to not make the radii of a circle equal. On the actualist reading, the

freedom of Descartes' God to not create eternal truths would have to reduce to His independence from all things.[24] Although Descartes does not come forward and actually state the Spinozistic view, it is interesting that he is reported as having stated it in *Conversation with Burman*:

> Concerning ethics and religion,… the opinion has prevailed that God can be altered, because of the prayers of mankind; for no one would have prayed to God if he knew, or had convinced himself, that God was unalterable…. From the metaphysical point of view, however, it is quite unintelligible that God should be anything but completely unalterable. It is irrelevant that the decrees could have been separated from God; indeed, this should not really be asserted. For although God is completely indifferent with respect to all things, he necessarily made the decrees he did, since he necessarily willed what was best, even though it was of his own will that he did what was best. We should not make a separation here between the necessity and the indifference that apply to God's decrees; although his actions were completely indifferent, they were also completely necessary. Then again, although we may conceive that the decrees could have been separated from God, this is merely a token procedure of our own reasoning: the distinction thus introduced between God himself and his decrees is a mental, not a real one. In reality the decrees could not have been separated from God: he is not prior to them or distinct from them, nor could he have existed without them.

If Descartes does hold that there are possible eternal truths that God does not actualize, it is difficult to see where they would fit in Descartes' ontology. It is also difficult to see how they square with some important pillars of Descartes' system. Descartes might be an actualist, and if he is he might be revealing this to Burman. Alternatively, Descartes might include unactualized eternal truths in his ontology. If he does posit such things, that might be evidence that he is not really so committed to his dualism or to the tenets that entail that potential being is strictly speaking nothing.

Thus far we have considered the interpretive issue of whether or not Descartes' eternal truths could have been otherwise. A question that still remains to be considered concerns the ontological status of Descartes' eternal truths, regardless of whether or not they could have been otherwise.

One view is that since Descartes' eternal truths are neither finite mental things, finite physical things, nor God, they must be something akin to Platonic forms.[25] A problem with this view, of course, is that it does violence to Descartes' parsimonious dualism. A second view is that eternal truths are to be located in God.[26] One of the merits of this view is that it provides for eternal truths to be eternal in a very robust sense. Since God is eternal, eternal truths are eternal presumably only if they are in God. Still, this view conflicts with the fact that Descartes holds that eternal truths are creatures.

A third reading of Descartes on eternal truths is that they are true ideas that conform to God's creation. In *Principles* I:48, Descartes says that eternal truths are beings which "have no existence outside our thought" (AT 8A:23, CSM 1:208). If eternal truths are truths that have no existence outside of our thought, one interpretive possibility is that they are simply true ideas. Since for Descartes truth is the

conformity of thought with its object, like any other true ideas eternal truths conform to God or His creation. A problem with this interpretation is that, although it is easy to see how it allows eternal truths to be true, it is difficult to see how it allows them to be eternal.[27] Descartes does allow that things can properly be called 'eternal' when they "are always the same" (Fifth Replies, AT 7:381, CSM 2:262). However, Descartes says to Mersenne that "from all eternity [God] willed them [eternal truths] to be, and by that very fact he created them" (To [Mersenne], 27 May 1630, AT 1:152, CSMK 25). Here Descartes appears to attribute to eternal truths an eternity that they cannot have if they have no existence outside of our thought.[28]

4. Real Distinction

Any interpretation of Descartes' views on modality needs to be sensitive to his view that mind and body are really distinct. The conclusion of his Sixth Meditation argument for substance dualism is that "I am really distinct from my body, and can exist without it" (AT 7:78, CSM 2:54). A natural reading of Descartes' conclusion has him saying that, for any minds and bodies that are united, it is counterfactually possible that they be separated.[29] His argument would be as follows:

1. I clearly and distinctly understand mind apart from body and body apart from mind.
2. God can bring about whatever I clearly and distinctly perceive.
3. God can bring about that mind is apart from body and body is apart from mind.
4. If God can bring about that mind is apart from body and body is apart from mind, then mind and body can exist apart.
5. Mind and body can exist apart.

Such a reading is sensitive not only to Descartes' Sixth Meditation comments but also to his further remarks on real distinction in Fourth Replies. There Descartes says that for "establishing a real distinction it is sufficient that two things can be understood as 'complete' and that each one can be understood apart from the other" (AT 7:221, CSM 2:156). A thing is complete, for Descartes, when it is a substance:

> … [B]y a 'complete thing' I simply mean a substance endowed with the forms or attributes which enable me to recognize that it is a substance. (AT 7:222, CSM 2:156)

Since a Cartesian substance is a thing that is ontologically independent (*Principles* I:51-52), a complete thing is an ontologically independent thing. When we clearly and distinctly perceive mind and body to be complete, we know that they are substances. When we still clearly and distinctly perceive them to be substances after clearly and distinctly perceiving them apart from each other, we know that they are not the same substance under different descriptions. On this view, Descartes holds that mind and body are ontologically independent substances, and their distinctness consists in their ability to continue to exist even after God separates them.[30]

An alternative interpretation of Descartes on the real distinction between mind and body reads the distinction as consisting in the the ontological independence of mind and body, but not in their separability.[31] Descartes holds that a sufficient condition for establishing a real distinction between two things is clearly and distinctly perceiving them to be non-identical substances (AT 7:13, CSM 2:9; AT 7:221-223, CSM 2:156-156). He therefore holds that the substantiality of two non-identical substances does not consist in their being separable but is just an indication of their separability.[32] On this view, mind and body are separable for Descartes; it's just that their separability is a consequence of the (different) fact that they are really distinct.[33]

One of the puzzles that the latter view addresses but that the earlier view does not is that Descartes holds that God brings about what we clearly and distinctly perceive but says (in his proof of real distinction) that God *can* bring about whatever we clearly and distinctly perceive. Presumably, if Descartes holds that our clear and distinct perceptions are veridical, a clear and distinct perception of mind apart from body should not tell us that mind and body *can* exist apart from each other. The latter view allows for the veridicality of our clear and distinct perception by understanding our clear and distinct perception of the apartness of mind and body as entailing their ontological independence. However, the view does not resolve the problem of why Descartes says that God can bring about whatever we clearly and distinctly perceive. How we proceed here is a function of the extent to which we appeal to the rest of Descartes' system in determining his views on a particular issue. The rest of Descartes' system entails that God has made things as we clearly and distinctly perceive them. Even more puzzling is that in Fourth Replies Descartes says that his reason for mentioning God's power in the Sixth Meditation proof of real distinction is to remind his reader that our clear and distinct perceptions are veridical (AT 7:226, CSM 2:159).

The interpretive issue of reading Descartes' particular views in light of his systematic commitments is especially pressing when it comes to his view that mind and body are really distinct. If Descartes holds that potential being is strictly speaking nothing, and if his parsimonious ontology and his commitment to divine simplicity bar possibilities from his system, it is not clear what to make of the possibility of mind and body existing in separation. One view might be that Descartes is committed to the reality of this possibility and that, with his commitment to other possibilities, this commitment is part of a pattern of Descartes' helping himself to entities that his system does not allow. That is, it might be the case that Descartes wants his system to be rich enough to posit possibilities and that, when it isn't, he posits them anyway. It also might be the case that Descartes' conclusion that mind and body can exist apart just reflects that when he draws the conclusion he has not yet proven that anything material exists. If he is adhering to his rule of affirming only what he clearly and distinctly perceives, he should not say that mind and body are actually apart -- that is, are actually substances -- until he has proven that body actually exists. The claim that mind and body can exist apart might be tracking just this.[34] His claim that God can make mind and matter into separate substances might just be a reminder to us that God has enough power to have done this even when it might seem impossible to us for such different substances to be united.

5. The System and its Pillars

It is presumably an adequacy condition on the interpretation of the work of any systematic philosopher that the work be interpreted in light of the central tenets of that philosopher's system. The interpretive problem of course is that for almost any such philosopher there are controversies about what these central tenets are. It is uncontroversial that Descartes sometimes speaks of possibility and necessity. What is not so uncontroversial is what he is talking about when he talks about these. In particular, if Descartes is committed to the view that there is unactualized possible being, then either (1) the alleged parts of his system that seem to disallow such being are not parts of his system, (2) the parts of his system that seem to disallow such being do not really disallow it, or (3) he is not a systematic philosopher.

Notes to Descartes' Modal Metaphysics

Notes

1. Second Replies, AT 7:149, CSM 2:106. This is of course just a restatement of Descartes' Fourth Meditation truth rule. See also Fifth Replies, AT 7:350-351, CSM 2:243. I use "CSM" to refer to the pagination in Cottingham, Stoothoff, and Murdoch 1984 and Cottingham, Stoothoff, and Murdoch 1985. I use "CSMK" to refer to the pagination in Cottingham, Stoothoff, Murdoch, and Kenny 1991. I use "AT" to refer to the pagination in Adam and Tannery 1996.

2. Fourth Replies, AT 7:249, CSM 2:173. See also Curley 1986; Garber 1986, 81-97; Cottingham 1988, 43-46; Cunning 2002, Cunning 2003a, and Cunning 2003b.

3. See Cunning 2003b.

4. Second Replies, AT 7:130-131, CSM 2:94. See also *Principles of Philosophy* I:73, AT 8A:37, CSM 1:220. Descartes says that because "there is nothing whose true nature we perceive by the senses alone, it turns out that most people have nothing but confused perceptions throughout their entire lives."

5. There are parallel passages in Second Replies at AT 7:163-164, CSM 2:115, and AT 7:166, CSM 2:117.

6. To [Mesland], 2 May 1644; AT 4:118, CSMK 235. See also "Conversation with Burman, 16 April 1648," AT 5:160, CSMK 343. The passages in the latter are tricky because they are Burman's reports of one of his discussions with Descartes.

7. See also Mattern 1984, 475, 486-487; and Alanen (1991).

8. Wilson 1978, 185-198. A discussion of Wilson's view is in section four.

9. Normore 1991, 68.

10. Normore 1991, 69-71, and Normore 1986, 224 and 231-234.

11. *Principles* I:48, AT 8A:23, CSM 1:208. Descartes mentions in the first line of this section of *Principles* that "eternal truths" are part of his ontology as well. These are beings which, as he puts it,

"have no existence outside our thought." Whatever they are, they fit nicely into Descartes' dualistic ontology as features internal to created minds. (See Cunning 2003b.) A discussion of eternal truths is in section three below.

12. See Nelson and Cunning 1999, 141-143, and Cunning 2003a.

13. See Nelson 1993, 685-688, and Nelson and Cunning 1999.

14. It should be noted that in the Early Modern period this view was not so unusual. Spinoza embraced a full-blown actualism, and it might be that in doing so he was just following Descartes. (See Cunning 2003b.)

15. It is interesting to note that after Descartes says to Mesland that "our mind is finite and so created as to be able to perceive as possible things which God has wished to be in fact possible," he immediately retreats. After flirting with this and other ideas concerning what God has made possible, Descartes says,

> … if we would know the immensity of his power we should not put these thoughts before our minds, nor should we conceive any precedence or priority between his intellect and his will; for the idea which we have of God teaches us that there is in him only a single activity, entirely simple and entirely pure. (AT 4:119, CSMK 235)

Here Descartes appears to be applying his actualism and saying that since God wills whatever he understands, the thought of an unactualized possible is incoherent and thus something of which we ought not speak when doing metaphysics.

16. See Bennett 1994, 647-649.

17. See Frankfurt 1977.

18. To [Mesland], 2 May 1644; AT 4:118, CSMK 235; Frankfurt 1977, 43.

19. For [Arnauld], 29 July 1648; AT 5:224, CSMK 358-359; Frankfurt 1977, 49.

20. Frankfurt 1977, 50-51.

21. Curley 1984, 579-503.

22. AT 4:118-119, CSMK 235; Curley 1984, 582.

23. See Nelson and Cunning 1999, 144-146.

24. See Nelson and Cunning 1999, 144-145, and Cunning 2003b.

25. Kenny 1970, 692-700.

26. Schmaltz 1991, 135.

27. Vere Chappell points this out in Chappell 1997, 123-27.

28. It may be that Descartes equivocates in his use of eternal. He holds that God exists from eternity and that He wills everything from eternity, yet he holds that eternal truths have no existence outside of our thought. His view might just be that eternal truths exist in non-eternal finite minds and are eternal in the sense that their truth values do not change. This reading squares with the passages (AT 1:145, CSMK 23; and AT 2:138, CSMK 103) in which Descartes distances himself from the view that eternal truths are eternal in any robust sense. See Cunning 2003b.

29. Wilson 1978, 185-198, and Curley 1978, 193-206. See also Gueroult 1984, 47-57.

30. Wilson 1978, 196-198.

31. Rozemond 1998, 28-37.

Descartes' Ontological Argument

Descartes' ontological (or *a priori*) argument is both one of the most fascinating and poorly understood aspects of his philosophy. Fascination with the argument stems from the effort to prove God's existence from simple but powerful premises. Existence is derived immediately from the clear and distinct idea of a supremely perfect being. Ironically, the simplicity of the argument has also produced several misreadings, exacerbated in part by Descartes' failure to formulate a single version.

The main statement of the argument appears in the Fifth Meditation. This comes on the heels of an earlier causal argument for God's existence in the Third Meditation, raising questions about the order and relation between these two distinct proofs. Descartes repeats the ontological argument in a few other central texts including the *Principles of Philosophy*. He also defends it in the First, Second, and Fifth Replies against scathing objections by some of the leading intellectuals of his day.

Descartes was not the first philosopher to formulate an ontological argument. An earlier version of the argument had been vigorously defended by St. Anselm in the eleventh century, and then criticized by a monk named Gaunilo (Anselm's contemporary) and later by St. Thomas Aquinas (though his remarks were directed against yet another version of the argument). Aquinas' critique was regarded as so devastating that the ontological argument died out for several centuries. It thus came as a surprise to Descartes' contemporaries that he should attempt to resurrect it. Although he claims not to be familiar with Anselm's version of the proof, Descartes appears to craft his own argument so as to block traditional objections.

Despite similarities, Descartes' version of the argument differs from Anselm's in important ways. The latter's version is thought to proceed from the meaning of the word "God," by definition, God is a being a greater than which cannot be conceived. Descartes' argument, in contrast, is grounded in two central tenets of his philosophy -- the theory of innate ideas and the doctrine of clear and distinct perception. He purports not to rely on an arbitrary definition of God but rather on an innate idea whose content is "given." Descartes' version is also extremely simple. God's existence is inferred directly from the fact that necessary existence is contained in the clear and distinct idea of a supremely perfect being. Indeed, on some occasions he suggests that the so-called ontological "argument" is not a formal proof at all but a self-evident axiom grasped intuitively by a mind free of philosophical prejudice.

Descartes often compares the ontological argument to a geometric demonstration, arguing that necessary existence cannot be excluded from idea of God anymore than the fact that its angles equal two right angles, for example, can be excluded from the idea of a triangle. The analogy underscores once again the

argument's supreme simplicity. God's existence is purported to be as obvious and self-evident as the most basic mathematical truth. It also attempts to show how the "logic" of the demonstration is rooted in our ordinary reasoning practices.

In the same context, Descartes also characterizes the ontological argument as a proof from the "essence" or "nature" of God, arguing that necessary existence cannot be separated from the essence of a supremely perfect being without contradiction. In casting the argument in these terms, he is implicitly relying on a traditional medieval distinction between a thing's essence and its existence. According to this tradition, one can determine what something is (i.e. its essence), independently of knowing whether it exists. This distinction appears useful to Descartes' aims, some have thought, because it allows him to specify God's essence without begging the question of his existence.

---

1. The Simplicity of the "Argument"

One of the hallmarks of Descartes' version of the ontological argument is its simplicity. Indeed, it reads more like the report of an intuition than a formal proof. Descartes underscores the simplicity of his demonstration by comparing it to the way we ordinarily establish very basic truths in arithmetic and geometry, such as that the number two is even or that the sum of the angles of a triangle is equal to the sum of two right angles. We intuit such truths directly by inspecting our clear and distinct ideas of the number two and of a triangle. So, likewise, we are able to attain knowledge of God's existence simply by apprehending that necessary existence is included in the clear and distinct idea of a supremely perfect being. As Descartes writes in the Fifth Meditation:

> [1] But if the mere fact that I can produce from my thought the idea of something entails that everything which I clearly and distinctly perceive to belong to that thing really does belong to it, is not this a possible basis for another argument to prove the existence of God? Certainly, the idea of God, or a supremely perfect being, is one that I find within me just as surely as the idea of any shape or number. And my understanding that it belongs to his nature that he always exists is no less clear and distinct than is the case when I prove of any shape or number that some property belongs to its nature (AT 7:65; CSM 2:45).

One is easily misled by the analogy between the ontological argument and a geometric demonstration,

and by the language of "proof" in this passage and others like it. Descartes does not conceive the ontological argument on the model of an Euclidean or axiomatic proof, in which theorems are derived from epistemically prior axioms and definitions. On the contrary, he is drawing our attention to another method of establishing truths that informs our ordinary practices and is non-discursive. This method employs intuition or, what is the same for Descartes, clear and distinct perception. It consists in unveiling the contents of our clear and distinct ideas. The basis for this method is the rule for truth, which was previously established in the Fourth Meditation. According to the version of this rule invoked in the Fifth Meditation, whatever I clearly and distinctly perceive to be contained in the idea of something is true of that thing. So if I clearly and distinctly perceive that necessary existence pertains to the idea of a supremely perfect being, then such a being truly exists.

Although Descartes maintains that God's existence is ultimately known through intuition, he is not averse to presenting formal versions of the ontological argument. He never forgets that he is writing for a seventeenth-century audience, steeped in scholastic logic, that would have expected to be engaged at the level of the Aristotelian syllogism. Descartes satisfies such expectations, presenting not one but at least two separate versions of the ontological argument. These proofs, however, are stunningly brief and betray his true intentions. One version of the argument simply codifies the psychological process by which one intuits God's existence, in the manner described above:

Version A:

1. Whatever I clearly and distinctly perceive to be contained in the idea of something is true of that thing.
2. I clearly and distinctly perceive that necessary existence is contained in the idea of God.
3. Therefore, God exists.

The rule for truth appears here in the guise of the first premise, but it is more naturally read as a statement of Descartes' own alternative method of "demonstration" via clear and distinct perception or intuition. In effect, the first "premise" is designed to instruct the meditator on how to apply this method, the same role that the analogy with a geometric demonstration serves in passage [1].

When presenting this version of the argument in the First Replies, Descartes sets aside this first premise and focuses our attention on the second. In so doing, he is indicating the relative unimportance of the proof itself. Having learned how to apply Descartes' alternative method of reasoning, one need only perceive that necessary existence pertains to the idea of a supremely perfect being. Once one attains this perception, formal arguments are no longer required; God's existence will be self-evident (Second Replies, Fifth Postulate; AT 7:163-4; CSM 2:115).

Descartes sometimes uses traditional arguments as heuristic devices, not merely to appease a scholastically trained audience but to help induce clear and distinct perceptions. This is evident for example in the version of the ontological argument standardly associated with his name:

Version B:

1. I have an idea of supremely perfect being, i.e. a being having all perfections.
2. Necessary existence is a perfection.
3. Therefore, a supremely perfect being exists.

While this set of sentences has the surface structure of a formal argument, its persuasive force lies at a different level. A meditator who is having trouble perceiving that necessary existence is contained in the idea of a supreme perfect being can attain this perception indirectly by first recognizing that this idea includes every perfection. Indeed, the idea of a supremely perfect being just is the idea of a being having all perfections. To attempt to exclude any or all perfections from the idea of a supremely being, Descartes observes, involves one in a contradiction and is akin to conceiving a mountain without a valley (or, better, an up-slope without a down-slope). Having formed this perception, one need only intuit that necessary existence is itself a perfection. It will then be clear that necessary existence is one of the attributes included in the idea of a supremely perfect being.

While such considerations might suffice to induce the requisite clear and distinct perception in the meditator, Descartes is aiming a deeper point, namely that there is a conceptual link between necessary existence and each of the other divine perfections. It is important to recall that in the Third Meditation, in the midst of the causal argument for the existence of God, the meditator already discovered many of these perfections -- omnipotence, omniscience, immutability, eternality, simplicity, etc. Because our mind is finite, we normally think of the divine perfections separately and "hence may not immediately notice the necessity of their being joined together" (First Replies, AT 7:119; CSM 2:85). But if we attend carefully to "whether existence belongs to a supremely perfect being, and what sort of existence it is" we shall discover that we cannot conceive any one of the other attributes while excluding necessary existence from it (ibid.).

To illustrate this point Descartes appeals to divine omnipotence. He thinks that we cannot conceive an omnipotent being except as existing. Descartes' illustration presupposes the traditional, medieval understanding of "necessary existence." When speaking of this divine attribute, he sometimes uses the term "existence" *simpliciter* as shorthand. But in his more careful pronouncements he always insists on the phrase "necessary and eternal existence," which resonates with tradition. Medieval, scholastic philosophers often spoke of God as the sole "necessary being," by which they meant a being who depends only on himself for his existence (*a se esse*). This is the notion of "aseity" or self-existence. Since such a being does not depend on anything else for its existence, he has neither a beginning nor an end, but is eternal. Returning to the discussion in the First Replies, one can see how omnipotence is linked conceptually to necessary existence in this traditional sense. An omnipotent or all-powerful being does not depend ontologically on anything (for if it did then it would not be omnipotent). It exists by its own power:

> [2] when we attend to immense power of this being, we shall be unable to think of its existence as possible without also recognizing that it can exist by its own power; and we

> shall infer from this that this being does really exist and has existed from eternity, since it is quite evident by the natural light that what can exist by its own power always exists. So we shall come to understand that necessary existence is contained in the idea of a supremely perfect being ... . (ibid.)

Some readers have thought that Descartes offers yet a third version of the ontological argument in this passage (Wilson, 1978, 174-76), but whether or not that was his intention is unimportant, since his primary aim, as indicated in the last line, is to enable his meditator to intuit that necessary existence is included in the idea of God. Since there is a conceptual link between the divine attributes, a clear and distinct perception of one provides a cognitive route to any of the others.

Although Descartes sometimes uses formal versions of the ontological argument to achieve his aims, he consistently affirms that God's existence is ultimately known through clear and distinct perception. The formal versions of the argument are merely heuristic devices, to be jettisoned once has attained the requisite intuition of a supremely perfect being. Descartes stresses this point explicitly in the Fifth Meditation, immediately after presenting the two versions of the argument considered above:

> [3] whatever method of proof I use, I am always brought back to the fact that it is only what I clearly and distinctly perceive that completely convinces me. Some of the things I clearly and distinctly perceive are obvious to everyone, while others are discovered only by those who look more closely and investigate more carefully; but once they have been discovered, the latter are judged to be just as certain as the former. In the case of a right-angled triangle, for example, the fact that the square on the hypotenuse is equal to the square on the other two sides is not so readily apparent as the fact that the hypotenuse subtends the largest angle; but once one has seen it, one believes it just as strongly. But as regards God, if I were not overwhelmed by philosophical prejudices, and if the images of things perceived by the senses did not besiege my thought on every side, I would certainly acknowledge him sooner and more easily than anything else. For what is more manifest than the fact that the supreme being exists, or that God, to whose essence alone existence belongs, exists? (AT 7:68-69; CSM 2:47)

Here Descartes develops his earlier analogy between the (so-called) ontological argument and a geometric demonstration. He suggests that there are some meditators for whom God's existence is immediately manifest; for them God's existence is akin to an axiom or definition in geometry, such as that the hypotenuse of a right triangle subtends its largest angle. But other meditators, whose minds are confused and mired in sensory images, must work much harder, and might even require a proof to attain the requisite clear and distinct perception. For them, God's existence is akin to the Pythagorean Theorem. The important point is that both kinds of meditators ultimately attain knowledge of God's by clearly and distinctly perceiving that necessary existence is contained in the idea of supremely perfect being. Once one has achieved this perception, God's existence will be manifest or, as Descartes says elsewhere, "self-evident" (*per se notam*) (Second Replies, Fifth Postulate; AT 7: 164; CSM 2:115).

Descartes' contemporaries would have been surprised by this last remark. While reviewing an earlier version of the ontological argument, Aquinas had rejected the claim that God's existence is self-evident, at least with respect to us. He argued that what is self-evident cannot be denied without contradiction, but God's existence can be denied. Indeed, the proverbial fool says in his heart "There is no God" (Psalm 53.1).

When confronted with this criticism by a contemporary objector, Descartes tries to find common ground: "St. Thomas asks whether existence is self-evident as far as we are concerned, that is, whether it is obvious to everyone; and he answers, correctly, that it is not" (First Replies, AT 7:115; CSM 2:82). Descartes interprets Aquinas to be claiming that God's existence is not self-evident *to everyone*, which is something with which he can agree. Descartes does not hold that God's existence is immediately self-evident, or self-evident to everyone, but that it can become self-evident to some careful and industrious meditators.

2. The Distinction between Essence and Existence

In the Fifth Meditation and elsewhere Descartes says that God's existence follows from the fact that existence is contained in the "true and immutable essence, nature, or form" of a supremely perfect being, just as it follows from the essence of a triangle that its angles equal two right angles. This way of putting the *a priori* argument has puzzled commentators and has led to a lively debate about the ontological status of Cartesian essences and the objects which are purported to "have" them. Some commentators have thought that Descartes is committed to a species of Platonic realism. According to this view, some objects that fall short of actual existence nevertheless subsist as abstract, logical entities outside the mind and beyond the physical world (Kenny, 1968; Wilson, 1978). Another commentator places Cartesian essences in God (Schmaltz 1991), while two recent revisionist interpretations (Chappell, 1997; Nolan, 1997) read Descartes as a conceptualist who takes essences to be ideas in human minds.

Descartes' reference to "essences" raises another important issue more directly related to the ontological argument. In claiming that necessary existence cannot be excluded from the essence of God, Descartes is drawing on the traditional medieval distinction between essence and existence. According to this distinction, one can say *what* something is (i.e. its essence), prior to knowing whether it exists. So, for example, one can define what a horse is -- enumerating all of its essential properties -- before knowing whether there are any horses in the world. The only exception to this distinction was thought to be God himself, whose essence just is to exist. It is easy to see how this traditional distinction could be exploited by a defender of the ontological argument. Existence is included in the essence of a supremely perfect being, but not in the essence of any finite thing. Thus it follows solely from the essence of the former that such a being actually exists. At times, Descartes appears to support this interpretation of the ontological argument. In the Fifth Replies, for example, he writes that "the existence of a triangle should not be compared with the existence of God, since the relation between existence and essence is manifestly quite different in the case of God from what it is in the case of the triangle. God is his own existence, but this

is not true of the triangle" (AT 7:383; CSM 2:263). But Descartes' complete view is subtler and more sophisticated than these remarks first suggest. Understanding this view requires a more careful investigation of the distinction between essence and existence as it appears in medieval sources. Although one often speaks of the "traditional" distinction, the exact nature of the relation between essence and existence in finite things was the subject of a fierce debate among medieval philosophers. Seeing where Descartes' position fits within this debate will provide a deeper understanding of his version of the ontological argument.

The distinction between essence and existence can be traced back as far as Boethius in the fifth century. It was later developed by Islamic thinkers such as Avicenna. But the issue did not become a major philosophical problem until it was taken up by Aquinas in the thirteenth century. The issue arose not as part of an effort to establish God's existence on *a priori* grounds (as mentioned above, Aquinas was one of the staunchest critics of the ontological argument), but out of concern to distinguish God from finite spiritual entities such as angels. Like many scholastic philosophers, Aquinas believed that God is perfectly simple and that created beings, in contrast, have a composite character that accounts for their finitude and imperfection. In the case of purely spiritual or nonmaterial creatures, he attempted to locate this character in the composition of essence and existence.

Some of the details of Aquinas' account will emerge from our discussion below. The primary interest of his theory for our purposes, however, is that it led to a lively debate among his successors both as to how to interpret the master and about the true nature of the relation between essence and existence in created things. This debate produced three main positions:

1. The Theory of Real Distinction
2. The Intermediate Position
3. The Theory of Rational Distinction

Proponents of the first view conceived the distinction between essence and existence as obtaining between two separate things. In the eyes of many Thomists, this view was considered to be quite radical, especially as an interpretation of Aquinas' original position. The latter is sometimes expressed by saying that essence and existence are "principles of being" rather than beings themselves. One problem with the theory of real distinction then was that it reified essence and existence, treating them as real beings in addition to the created entity that they compose.

The theory of real distinction was also considered objectionable for philosophical reasons. Following Aquinas, many participants in the debate urged that essence and existence are related to each other as potency and act, so that existence can be said to "actualize" essence. On the theory of real distinction, this view leads to an infinite regress. If an essence becomes actual only in virtue of something else -- *viz.* existence -- being superadded to it, then what gives existence its reality, and so on *ad infinitum*? (Wippel, 1982, 393f).

In response to these difficulties some scholastic philosophers developed a position at the polar extreme

from the theory of real distinction. This was the view that there is merely a rational distinction or a "distinction of reason" between essence and existence in created beings. As the term suggests, this theory held that essence and existence of a creature are identical in reality and distinguished only within our thought by means of reason. Needless to say, proponents of this theory were forced to distinguish purely spiritual entities from God on grounds other than real composition.

Giving up the doctrine of real composition seemed too much for another group of thinkers who were also critical of the theory of real distinction. This led to the development of a number of intermediate positions. One such position was that essence and existence are modally or formally distinct, such that existence constitutes a mode or property of a thing's essence.

Like Francisco Suárez, his most immediate scholastic predecessor, Descartes sides with the proponents of a rational distinction between essence and existence. His position is unique, however, insofar as it springs from a more general theory of "attributes". Articulating this theory in an important passage in the *Principles of Philosophy*, Descartes claims that there is merely a distinction of reason between a substance and any one of its attributes or between any two attributes of a single substance (1:62, AT 8A:30; CSM 1:214). For Descartes' purposes, the most significant instance of a rational distinction is that which obtains between a substance and its essence -- or what he sometimes refers to as its "principal attribute" (1:53, AT 8A:25; CSM 1:210). Since thought and extension constitute the essence of mind and body, respectively, a mind is merely rationally distinct from its thinking and a body is merely rationally distinct from its extension (1:63, AT 8A:31; CSM 1:215). But Descartes insists that a rational distinction also obtains between any two attributes of a substance. Since existence qualifies as an attribute in this technical sense, the essence and existence of a substance are also distinct merely by reason (1:56, AT 8A:26; CSM 1:211). Descartes reaffirms this conclusion in a letter intended to elucidate his account of the relation between essence and existence:

> [4]... existence, duration, size, number and all universals are not, it seems to me, modes in the strict sense ... . They are referred to by a broader term and called attributes ... because we do indeed understand the essence of a thing in one way when we consider it in abstraction from whether it exists or not, and in a different way when we consider it as existing; but the thing itself cannot be outside our thought without its existence ... . Accordingly I say that shape and other similar modes are strictly speaking modally distinct from the substance whose modes they are; but there is a lesser distinction between the other attributes ... . I call it a rational distinction ... . (To an unknown correspondent, AT 4:349; CSMK 3:280)

Indications are given here as to how a rational distinction is produced in our thought. Descartes explains that we regard a single thing in different abstract ways. Case in point, we can regard a thing as existing, or we can abstract from its existence and attend to its other aspects. In so doing, we have distinguished the existence of a substance from its essence within our thought. Like scholastic proponents of the theory of rational distinction, however, Descartes is keen to emphasize that this distinction is purely conceptual. Indeed, he goes on to explain that the essence and existence of a substance are "in no way distinct" outside thought (AT 4:350; CSMK 3:280). In reality they are identical.

While borrowing much from scholasticism, Descartes' account is distinguished by its scope of application. He extends the theory of rational distinction from created substances to God. In general, the essence and the existence of a substance are merely rationally distinct, and hence identical in reality.

This result appears to wreak havoc on Descartes' ontological argument. One of the most important objections to the argument is that if it were valid, one could proliferate such arguments for all sorts of things, including beings whose existence is merely contingent. By supposing that there is merely a rational distinction between essence and existence abroad in all things, Descartes seems to confirm this objection. In general, a substance is to be identified with its existence, whether it is God or a finite created thing.

The problem with this objection, in this instance, is that it assumes that Descartes locates the difference between God and creatures in the relation each of these things bears to its existence. This is not the case. In a few important passages, Descartes affirms that existence is contained in the clear and distinct idea of every single thing, but he also insists that there are different grades of existence:

> [5] Existence is contained in the idea or concept of every single thing, since we cannot conceive of anything except as existing. Possible or contingent existence is contained in the concept of a limited thing, whereas necessary and perfect existence is contained in the concept of a supremely perfect being (Axiom 10, Second Replies; AT 7:166; CSM 2:117).

In light of this passage and others like it, we can refine the theory of rational distinction. What one should say, strictly speaking, is that God is merely rationally distinct from his *necessary* existence, while every finite created thing is merely rationally distinct from its *possible* or *contingent* existence. The distinction between possible or contingent existence on the one hand, and necessary existence on the other, allows Descartes to account for the theological difference between God and his creatures.

Now, when Descartes says that a substance (be it finite or infinite) is merely rationally distinct from its existence, he always means an actually existing substance. So how are we to understand the claim that a finite substance is merely rationally distinct from its *possible* existence? What is meant by "possible (or contingent) existence"? It is tempting to suppose that this term means non-actual existence. But as we saw already with the case of necessary existence, Descartes does not intend these terms in their logical or modal senses. If "necessary existence" means ontologically independent existence, then "possible existence" means something like *dependent* existence. After all, Descartes contrasts possible existence not with actual existence but with necessary existence in the traditional sense. This account is also suggested by the term "contingent." Created things are contingent in the sense that they depend for their existence on God, the sole independent being.

This result explains why Descartes believes that we cannot proliferate ontological arguments for created substances. It is not that the relation between essence and existence is any different in God than it is in finite things. In both cases there is merely a rational distinction. The difference is in the grade of

existence that attaches to each. Whereas the concept of an independent being entails that such a being exists, the concept of a finite thing entails only that it has dependent existence.

Looking back at the problematic passage cited above from the Fifth Replies, it becomes clear that Descartes intended something along these lines even there. He says that "the existence of a triangle should not be compared with the existence of God", reinforcing the point that it is the kind of existence involved that makes God unique. And just before this statement, he writes, "in the case of God necessary existence...applies to him alone and forms a part of his essence as it does of no other thing". Later he adds: "I do not ... deny that possible existence is a perfection in the idea of a triangle, just as necessary existence is perfection in the idea of God" (AT 7:383; CSM 2:263). Descartes' final position then is that essence and existence are identical in all things. What distinguishes God from creatures is his grade of existence. We can produce an ontological argument for God, and not for finite substances, because the idea of a supremely perfect being uniquely contains necessary -- or ontologically independent -- existence.

[Return to Section links]

3. Objections and Replies

Because of its simplicity, Descartes' version of the ontological argument is commonly thought to be cruder and more obviously fallacious than the one put forward by Anselm in the eleventh century. But when the complete apparatus of the Cartesian system is brought forth, the argument proves itself to be quite resilient, at least on its own terms. Indeed, Descartes' version is superior to his predecessor's insofar as it is grounded in a theory of innate ideas and the doctrine of clear and distinct perception. These two doctrines inoculate Descartes from the charge made against Anselm, for example, that the ontological argument attempts to define God into existence by arbitrarily building existence into the concept of a supremely perfect being. In the Third Meditation, the meditator discovers that her idea of God is not a fiction that she has conveniently invented but something native to the mind. As we shall see below, these two doctrines provide the resources for answering other objections as well.

Given our earlier discussion concerning the non-logical status of the ontological argument, it may seem surprising that Descartes would take objections to it seriously. He should be able to dismiss most objections in one neat trick by insisting on the non-logical nature of the demonstration. This is especially true of objection that the ontological argument begs the question. If God's existence is ultimately self-evident and known by a simple intuition of the mind, then there are no questions to be begged. Unfortunately, not all of the objections to the ontological argument can be dismissed so handily, for the simple reason that they do not all depend on the assumption that we are dealing with a formal proof.

Although it is often overlooked, many of the best known criticisms of the ontological argument were put to Descartes by official objectors to the *Meditations*. He in turn responded to these objections -- sometimes in lengthy replies -- though many contemporary readers have found his responses opaque and unsatisfying. We can better understand his replies and, in some cases, improve upon them by appealing

to discussions from previous sections.

One classical objection to the ontological argument, which was first leveled by Gaunilo against Anselm's version of the proof, is that it makes an illicit logical leap from the mental world of concepts to the real world of things. The claim is that even if we were to concede that necessary existence is inseparable from the idea of God (in Kant's terms, even if necessary existence were analytic of the concept "God"), nothing follows from this about what does or does not exist in the actual world. Johannes Caterus, the author of the First Set of Objections to the *Meditations*, puts the point as follows:

> [6] Even if it is granted that a supremely perfect being carries the implication of existence in virtue of its very title, it still does not follow that the existence in question is anything actual in the real world; all that follows is that the concept of existence is inseparably linked to the concept of a supreme being. So you cannot infer that the existence of God is anything actual unless you suppose that the supreme being actually exists; for then it will actually contain all perfections, including the perfection of real existence (AT 7:99; CSM 2:72).

To meet this challenge, Descartes must explain how he "bridges" the inferential gap between thought and reality. The principle of clear and distinct perception is intended to do just that. According to this principle, for which he argues in the Fourth Meditation, whatever one clearly and distinctly perceives or understands is true -- true not just of ideas but of things in the real world represented by those ideas. Thus, Descartes' commitment to the principle of clear and distinct perception allows him to elude another objection that had haunted Anselm's version of the argument.

The previous objection is related to another difficulty raised by Caterus. In order to illustrate that the inference from the mental to the extra-mental commits a logical error, critics have observed that if such inferences were legitimate then we could proliferate ontological arguments for supremely perfect islands, existing lions, and all sorts of things which either do not exist or whose existence is contingent and thus should not follow *a priori* from their concept. The trick is simply to build existence into the concept. So while existence does not follow from the concept of lion *per se*, it does follow from the concept of an "existing lion."

Descartes' actual reply to this objection, which he took very seriously, is highly complex and couched in terms of a theory of "true and immutable natures." We can simplify matters by focusing on its key elements. One of his first moves is to introduce a point that we discussed earlier **(**see passage [5] in section 2), namely that existence is contained in the idea of every thing that we clearly and distinctly perceive: possible (or dependent) existence is contained in our clear and distinct idea of every finite thing and necessary (or independent) existence is uniquely contained in the idea of God (AT 7:117; CSM 2:83). So for Descartes one does not have to build existence into the idea of something if that idea is clear and distinct; existence is already included in every clear and distinct idea. But it does not follow that the thing represented by such an idea actually exists, except in the case of God. We cannot produce ontological arguments for finite things for the simple reason that the clear and distinct ideas of them

contain merely dependent existence. Actual existence is demanded only by the idea of God, which uniquely contains independent existence.

A natural rejoinder to this reply would be to ask about the idea of a lion having not possible but wholly *necessary* existence. If Descartes' method of reasoning were valid, it would seem to follow from this idea that such a creature exists. This formulation of the objection requires Descartes' second and deeper point, which is only hinted at in his official reply. This is that the idea of a lion -- let alone the idea of a lion having necessary existence -- is hopelessly obscure and confused. As Descartes says, the nature of a lion is "not transparently clear to us" (Axiom 10, Second Replies; AT 7:117; CSM 2:84). Since this idea is not clear and distinct, the method of demonstration employed in the ontological argument does not apply to it. Recall that the geometrical method of demonstration is grounded in the principle of clear and distinct perception and consists in drawing out the contents of our clear and distinct ideas. If an idea is not clear and distinct then we cannot draw any conclusions from it about things outside thought.

The key difference then between the idea of God on the one hand and the idea of a necessarily existing lion is that the former can be clearly and distinctly perceived. For Descartes, it is just a brute fact that certain ideas can be clearly and distinctly perceived and others cannot. Some critics have charged him with dogmatism in this regard. Why should Descartes be allowed to legislate the scope of our clear and distinct perceptions? Perhaps we can clearly and distinctly perceive something that he could not.

Descartes cannot be saved entirely from this charge, but two important points can be made in his defense. First, he has principled reasons for thinking that everyone has the same set of innate or clear and distinct ideas. When the meditator first proved God's existence in the Third Meditation, she also established that God is supremely good and hence no deceiver. One consequence of God's perfect benevolence is that he implanted the same set of innate ideas in all finite minds. Thus, Descartes feels justified in concluding that the limits of his capacity for clear and distinct perception will be shared by everyone.

Second, when responding to objections to the ontological argument such as the ones considered above, Descartes typically does more than insist dogmatically on a unique set of clear and distinct ideas. He also tries to dispel the confusion which he thinks is at the root of the objection. Since the ontological argument ultimately reduces to an axiom, the source of an objection according to Descartes' diagnosis is the failure of the objector to perceive this axiom clearly and distinctly. Thus, Descartes devotes the bulk of his efforts to trying to remove those philosophical prejudices which are hindering his objector from intuiting the axiom. These efforts are not always obvious, however. Descartes is good at maintaining the pretense of answering criticisms to a formal proof. But his replies to Caterus' objections to the ontological argument are best read as an extended effort to dispel prejudice and confusion, so as to enable his reader to intuit God's existence for himself.

Perhaps the most interesting objection to the ontological argument, and the one that has received the most attention since being formulated by Immanuel Kant, is that existence is not a property or predicate. This objection enjoys the status of a slogan known by every undergraduate philosophy major worth her salt. In claiming that existence is included in the idea of a supremely perfect being, along with all the

other divine attributes, Descartes' version of the argument appears to succumb to this objection.

It is not obvious of course that existence is *not* a predicate. To convince us of this point, Kant observes that there is no intrinsic difference between the concept of a hundred real thalers (coins common in Kant's time) and the concept of a hundred possible thalers. Whenever we think of anything, we regard it *as* existing, even if the thing in question does not actually exist. Thus, existence does not add anything to the concept of a thing. What then is existence if not a predicate? Kant's answer is that existence is "merely the positing of a thing" or "the copula of a judgment," the point being that when we say "God exists" we are simply affirming that there is an object answering to the concept of God. We are not ascribing any new predicates to God, but merely judging that there is a subject, with all its predicates, in the world (CPR:B626-27).

Kant's formulation of the objection was later refined by Bertrand Russell in his famous theory of descriptions. He argues that existential statements such as "God exists" are misleading as to their logical form. While serving grammatically as a predicate, the term "exists" in this sentence has a much different logical function, which is revealed only by analysis. Properly analyzed, "God exists" means "there is one (and only one) x such that ‘x is omnipotent, omniscient, etc.’ is true." Russell thinks this translation shows that, appearances to the contrary, the statement "God exists" is not ascribing existence to a subject, but asserting that a certain description (in single quotes) applies to something in reality. Russell's view is reflected in the standard modern logical treatment of existence as a quantifier rather than a predicate.

It is widely believed that Descartes did not have a response to this objection, indeed that he blithely assumed that existence is a property without ever considering the matter carefully. But this is not the case. The seventeenth-century empiricist Pierre Gassendi confronted Descartes with this criticism in the Fifth Set of Objections (and probably deserves credit for being the first to enunciate it): "existence is not a perfection either in God or in anything else; it is that without which no perfections can be present" (AT 7:323; CSM 2:224). As with most of his replies to Gassendi (whom he regarded as a loathsome materialist and quibbler), Descartes responded somewhat curtly. But it is clear from the discussion in section 2 that he had the resources for addressing this objection in a systematic manner.

Before examining how Descartes might defend himself, it is important to note that the question at issue is typically framed in non-Cartesian terms and thus often misses its target. Both Kant and Russell for example are interested in the logical issue of whether existence is a *predicate*. Descartes, in contrast, was not a logician and disparaged the standard subject-predicate logic inherited from Aristotle. Although, as discussed above, he sometimes presents formal versions of the ontological arguments as heuristic devices, Descartes thought that God's existence is ultimately known through intuition. This intuitive process is psychological in character. It is not a matter of assigning predicates to subjects but of determining whether the idea of a supremely perfect being can be clearly and distinctly perceived while excluding necessary existence from it through a purely intellectual operation. To be sure, Descartes was interested in the *ontological* question of whether existence is a "property" of substances. For him, however, the analogues of properties are clear and distinct ideas and ways of regarding them, not predicates.

Having said that, Descartes' best strategy for answering the ontological version of the objection is to concede it, or at least certain aspects of it. Descartes explicitly affirms Kant's point that existence does not add anything to the idea of something (provided that the terms "idea" and "concept" are regarded as psychological items). Once again we should recall passage [4] from the Second Replies: "Existence is contained in the idea or concept of every single thing, since we cannot conceive of anything except as existing" (Axiom 10, AT 7:166; CSM 2:117). So Descartes agrees with Kant that there is no conceptual difference between conceiving a given substance as actually existing and conceiving it as merely possible. In the first instance one is attending to the existence that is contained on every clear and distinct idea, and in the other instance one is ignoring the thing's existence without actively excluding it. He would, however, stress another conceptual difference that Kant and other critics do not address, namely that between the two grades of existence -- contingent and necessary. The clear and distinct ideas of all finite things contain merely contingent or dependent existence, whereas the clear and distinct idea of God uniquely contains necessary or wholly independent existence (ibid.). As discussed previously, the ontological argument hinges on this distinction.

Another intuition underlying the claim that existence is not a property is that there is more intimate connection between an individual and its existence than the traditional one between a substance and a property, especially if the property in question is conceived as something accidental. If existence were accidental, then a thing could be without its existence, which seems absurd. It seems no less absurd to say that existence is a property among other properties (accidental or essential), for how can a thing even have properties if it does not exist? Descartes shares this intuition. He does not think that existence is a property in the traditional sense or is even distinct from the substance that is said to bear it. Recall the view discussed in section 2 that there is merely a rational distinction between a substance and its existence, or between the essence and existence of a substance. This means that the distinction between a substance and its existence is confined to thought or reason. Human beings, in their efforts to understand things using their finite intellects, draw distinctions in thought that do not obtain in reality. In reality, a substance (whether it be created or divine) just is its existence.

The purpose of this defense of Descartes is not to render a verdict as whether he has the correct account of existence, but to show that he had a rather sophisticated and systematic treatment of what has been one of the great bugbears in the history of philosophy. He did not simply make the ad hoc assumption that existence is an attribute in order to serve the needs of the ontological argument. Indeed, on Descartes' view, existence is not a property in the traditional sense, nor can one conceive something without regarding it as existing. Descartes' critics might not be convinced by his account of existence, but then they have the burden of providing a better account. The focus of the debate will then be shifted to the question of who has the correct ontology, rather than whether the ontological argument *per se* is sound.

René Descartes' Life and Works

Descartes has been heralded the first modern philosopher. He is famous for having made an important connection between geometry and algebra, which allowed for the solving of geometrical problems by way of algebraic equations. He is also famous for having promoted a new conception of matter, which allowed for the accounting of physical phenomena by way of mechanical explanations. However, he is most famous for having written a relatively short work, *Meditationes de Prima Philosophia* (*Meditations On First Philosophy*), published in 1641, in which he provides a philosophical groundwork for the possibility of the sciences.

Early Years

Descartes was born in La Haye on March 31, 1596 of Joachim Descartes and Jeanne Brochard. He was one of a number of surviving children (two siblings and two half-siblings). His father was a lawyer and magistrate, which apparently left little time for family. Descartes's mother died in May of the year following his birth, and he, his full brother and sister, Pierre and Jeanne, were left to be raised by their grandmother in La Haye. At around ten years of age, in 1606, he was sent to the Jesuit college of La Fleche. He studied there until 1614, and in 1615 entered the University of Poitiers, where a year later he received his Baccalaureate and License in Canon & Civil Law. For the history and the text of his thesis, see the following supplementary document:

Descartes' Law Thesis

In 1618, at the age of twenty-two, he enlisted in the army of Prince Maurice of Nassau. It is not known what his duties were exactly, though Baillet suggests that he would have very likely been drawn to what would now be called the Corps of Engineers (Baillet, Livre 1, Chapitre 9, p. 41). This division would have engaged in applied mathematics, designing a variety of structures and machines aimed at protecting and assisting soldiers in battle. Sorell, on the other hand, notes that in Breda, where Descartes was stationed, the army "doubled as military academy for young noblemen on the Continent" (Sorell, p. 6). And, Gaukroger notes that the education of the young noblemen was structured around the educational model of Lipsius (1547-1606), a highly respected Dutch political theorist who received a Jesuit education at Cologne (Gaukroger, pp. 65-6). It is likely that the military environment (that is, the academy) at Breda would have reminded Descartes of La Fleche. Though there are reasons for thinking that he may have been a soldier, the majority of biographers argue that it is more likely that his duties were oriented more towards education or engineering.

While stationed at Breda, Descartes met the mathematician Isaac Beeckman (1588-1637). Notes that Descartes kept related to his correspondence reveal that he and Beeckman had become more than simple acquaintances-their relationship was more one of teacher and student (Descartes being the latter). This relationship would rekindle in Descartes an intense interest in the sciences. In addition to discussions about a wide variety of topics in natural science, a direct result of certain questions posed by Beeckman compelled Descartes to write the *Compendium Musicae*. Among other things, the *Compendium* attempted to work out a theory of harmony, rooted in the concepts of proportion or ratio, which (along the lines of the ancients) attempted to express the notion of harmony in mathematical terms. It would not be published during Descartes's lifetime. As for Beeckman, Descartes would later downplay his influence.

The World and *Discourse*

After Descartes left the army, in 1619, his whereabouts for the next few years are unknown. Based on what he says in the *Discours de la Methode* (*Discourse on the Method*), published in 1637, there is speculation that he spent time near Ulm (Descartes apparently attended the coronation of Ferdinand II in

Frankfurt in 1619). There is some evidence that would suggest that he was in France in 1622, for it was at this time that property he had inherited was sold-the proceeds of which would provide him a simple income for many years. There is some speculation that between 1623 and 1625 he visited Italy. Descartes emerges in 1625 in Paris, his notes revealing that he was in contact with Father Marin Mersenne (1588-1648), a member of the Order of Minims. This relationship would prompt Descartes to make public his thoughts on natural philosophy (science). It is by way of Mersenne that Descartes's work would find its way into the hands of some of the best minds living in Paris-for instance, Antoine Arnauld (1612-1694), Pierre Gassendi (1592-1655), and Thomas Hobbes (1588-1679).

In 1628 Descartes left Paris. At this time he seems to have been working on the *Regulae ad Directionem Ingenii* (*Rules for the Direction of the Mind*), a work that he would abandon, some speculating around the time of the move from Paris. In 1630 he moved to Amsterdam. There he worked on drafts of the *Dioptrique* (the *Optics*) and the *Meteors* (the *Meteorology*), which were very likely intended to be a part of a larger work, *Le Monde* (*The World*). In 1632 he moved again, this time to Deventer, to apparently teach Henry Reneri (1593-1639) his physics. It is also during his stay in Deventer that Descartes probably worked on a final draft of the *Traite de l'homme* (*Treatise on Man*), which in connection to the *Optics* and the *Meteorology* was probably originally intended to be a part of *The World*.

When *The World* had become ready for publication in 1633, upon hearing of the Church's condemnation of Galileo (1564-1642) in the same year, Descartes decided against its publication. For, the world system he had adopted in the book assumed, as did Galileo's, the heliocentric Copernican model. In a letter to Mersenne, dated November 1633, Descartes expresses his fear that were he to publish *The World*, the same fate that befell Galileo would befall him. And, this is something that he understandably wanted to avoid. *The World* appears to have been constituted of several smaller, but related, works: a treatise on physics, a treatise on mechanics (machines), a treatise on animals, and a treatise on man. Although much of *The World* has been lost, some of it seems to have survived in the form of essays attached to the *Discourse* which, as was mentioned earlier, would be published four years later, in 1637. And, some of it was published posthumously. Arguably, Constantijn Huygens (1596-1687) received what Descartes refers to as "three sheets" of *The World*, along with a letter dated 5 October 1637. These "sheets" deal primarily with mechanics.

Around 1635, Reneri began to teach "Cartesian" physics. Also during this year, a domestic servant by the name of Helene gave birth to a baby girl, Francine. According to a baptismal record, dated 28 July 1635, Descartes is named the father (AT I 395n). Gaukroger gives the baptismal date as 7 August 1635 (Gaukroger, p. 294). And, Genevieve Rodis-Lewis gives Francine's date of birth as 19 June 1635 (Rodis-Lewis, p. 40). In 1636 Reneri acquired an official chair in Philosophy at the University of Utrecht, and continued to build a following of students interested in Cartesian science. Around March of 1636, at the age of forty, Descartes moved to Leiden to work out the publishing of the *Discourse*. And, in 1637 it is published. With the *Discourse* out and a following of students building in Utrecht, Descartes seems to have turned his attention from career to family. In a letter dated 30 August 1637 we find him apparently working out an arrangement for Francine, but strangely refers to her as his "niece"-which suggests that he did not want certain people to know that he was a father. Gaukroger suggests that despite this apparent denial of paternity, Descartes not only corresponds with Francine, but in 1637 brings her and Helene to

his new home at Santpoort or Egmond-Binnen (Gaukroger, pp. 294, 332).

The *Discourse* is the first published work of Descartes's, coming some four years after his abandonment of the publishing of *The World*. This work is important for many reasons. For instance, it tells us what Descartes himself seems to have thought of his early education, and in particular, his early exposure to mathematics. Roger Ariew suggests that these refletions are not so much those of the historical Descartes, as much as they are those of a personna Descartes adopts in telling the story of the *Discourse* (Ariew, pp. 58-63). Uncontested, however, is the view that the *Discourse* sketches out the metaphysical underpinnings of the Cartesian system. And, as a bonus, it has three works that are attached to it that are apparently added so as to exemplify the method of inquiry it develops (though admittedly it is unclear how the method is applied in these essays). The attached essays are the *Optics*, the *Meteorology*, and *Le Geometrie* (the *Geometry*). As was suggested earlier, the *Optics* and *Meteorology* were very likely versions of works originally intended for *The World*.

It should be stressed that the three attached essays are important independent of the *Discourse*, for they contain much worth studying. In the *Optics*, for example, Descartes works out his laws of refraction, and within this context, what would later be called Snell's Law (which Descartes seems to have worked out as early as 1632). Further, although the Geometry would seem to have come out of nowhere, there is evidence in Descartes's notes to himself, from which Clerselier reconstructed some of Descartes's correspondence, that he had been working on some version of it as early as 1619. In a letter to Beeckman, dated 26 March 1619, for example, Descartes discusses the subject matter that is found in the *Geometry*, and in a letter dated 23 April 1619, he explicitly mentions the book's title. It is in this work that Descartes shows how certain geometrical problems can be solved by way of algebraic equations.

The significance of the sort of connection that Descartes made between geometry and algebra was great indeed, for without it the mathematization of the physics and the development of the calculus might not have happened when they did-a generation later via Sir Isaac Newton (1642-1727). It should be noted, however, that as groundbreaking as this work may be, contrary to the claims of many, nowhere in the *Geometry* is a "Cartesian Coordinate System" ever developed (that is, the *x*-*y* coordinate system taught to today's students of algebra), nor is he the originator of other mathematical concepts that bear his name, for example, the "Cartesian Product". Carl Boyer notes that various concepts that lead to analytic geometry are found for the first time in the *Geometry*, and that the *Geometry's* mathematical notation is still used today. But, he argues, although Cartesian geometry is taken by many to be synonymous with analytic geometry, the fact is that the fundamental aim of Descartes's system is quite different from that of contemporary analytic geometry (Boyer, pp. 370-1). And so, the claim that Descartes is the originator of analytic geometry, at least as we understand it today, overstates the case. As Boyer rightly points out, however, this does not diminish the importance of the work in the history of mathematics.

The *Meditations*

In 1639 Descartes began writing the *Meditations*. And, in 1640 he returned to Leiden to help work out its publication. During the year, Francine died. She was only five years old. Understandably, Descartes was

deeply saddened by her death. There is evidence to suggest that he was called away from Leiden around the time of her death, returning soon after. Some have speculated that he left Leiden to be at her side. Also during this year, Descartes's father and sister died. Descartes's relationship with his father (and brother) was of the sort that Pierre, his brother, failed to even bother him with the news of their father's death. Rather, it seems to have been in a letter from Mersenne that Descartes first learns of it. In a follow up letter to Mersenne, dated 3 December 1640, Descartes expresses regret in not having been able to see his father before his death. But, unlike any speculation that might be made concerning his having been with Francine at her death, it is clear that he refused to return to Paris (where his father had died) upon hearing of his father's death. Instead, he says, he will stay (in Leiden) to complete the publishing of the *Meditations*. Some have suggested that this in part demonstrates a profound strain that existed in the relationship between Descartes and his father.

Today, the *Meditations* is by far Descartes's most popular work-though this would not have been the case in Descartes's day. This work is important to today's scholar for many reasons, the least of which is its including as an attached text written objections from some of the best minds living in Paris. Mersenne sent the *Meditations* to philosophers and theologians for criticism. The list of critics includes: Caterus, Hobbes, Arnauld, Gassendi, and Mersenne himself, with several other unnamed readers who raised their objections through Mersenne. A later edition would include Bordin. Descartes replied to each critic, and the result was an appended text referred to as "The Objections and Replies." The second edition contains seven sets in all.

The *Meditations* opens by developing skeptical questions concerning the possibility of knowledge. Through a series of several carefully thought out meditations, the reader establishes (along with the author) the groundwork for the possibility of knowledge (scientia). Descartes is not a skeptic, as some have insisted, but uses skepticism as a vehicle to motivate his reader to "discover" by way of philosophical investigation what constitutes this ground. In the Second Replies, Descartes refers to this style of presentation as the "analytic" style. There were two styles of presentation: analytic and synthetic. It is important not to confuse these terms with those, say, used by Kant. For Descartes the analytic style of presentation (and inquiry) proceeds by beginning with what is commonly taken to be known and discovering what is necessary for such knowledge. Thus, the inquiry moves from what is commonly known to first principles. The "discovery" moves in such a way that each discovery is based on what was discovered before. By contrast, the synthetic style of presentation begins by asserting first principles and then to determining what follows. Prompted by Mersenne, Descartes sketches out in the Second Replies a synthetic rendering of the *Meditations*.

In establishing the ground for science, Descartes was at the same time overthrowing a system of natural philosophy that had been established for centuries-a qualitative, Aristotelian physics. In a letter to Mersenne, dated 28 January 1641, Descartes says "these six meditations contain all the foundations of my physics. But please do not tell people, for that might make it harder for supporters of Aristotle to approve them. I hope that readers will gradually get used to my principles, and recognize their truth, before they notice that they destroy the principles of Aristotle." Unlike his earlier work, *The World*, the *Meditations* parts ways with the "old" science without explicitly forwarding controversial views, like that of the Copernican heliocentric model of the solar system. Specifically, the Cartesian view denies that physics is

grounded in hot, cold, wet, and dry. It argues that contrary to Aristotle's view, such "qualities" are not properties of bodies at all. Rather, the only properties of bodies with which the physicist can concern him or herself are size, shape, motion, position, and so on-those modifications that conceptually (or logically) entail extension in length, breadth, and depth. In contrast to Aristotle's "qualities," the properties (or modes) of bodies dealt with in Cartesian physics are measurable specifically on ratio scales (as opposed to intensive scales), and hence are subject in all the right ways to mathematics (Buroker, pp. 596-7). This conception of matter, conjoined with the sort of mathematics found in the *Geometry*, allies itself with the work of such Italian natural philosophers as Tartaglia, Ubaldo, and Galileo, and helps further the movement of early thinkers in their attempts to establish a mathematical physics.

Descartes's letter to the "learned and distinguished men" of the Sorbonne, which is appended to the *Meditations*, suggests that he was trying to pitch the *Meditations* as a textbook for the university. Though the endorsement of the Learned Men would not have guaranteed that the *Meditations* would be accepted or used as a textbook, it could certainly be viewed as an important step to getting it accepted. Unlike today's notion of a textbook, in Descartes's day "textbooks" were intended mostly for teachers, not students. Typically, at the close of a teacher's career, his notes would be published for the benefit of those who would go on to teach such course material. The awkwardness of Descartes's seeking the acceptance and use of his *Meditations* by teachers is amplified by the fact that he was not a teacher himself. Consequently, his seeking "textbook" status would have very likely been viewed by those Learned Men as being a bit pretentious. He was, it could be said, a freelancer with no academic or political ties to the university (outside of his connection to Mersenne). And, he certainly lacked the credentials and reputation of someone like a Eustachius, whose widely used textbook of the period is of the sort the *Meditations* was in all likelihood aimed at replacing. Although the *Meditations* seems to have been endorsed by the Sorbonne, it was never adopted as a text for the university.

The *Principles*

Soon after the Sorbonne passed on the *Meditations*, Descartes's public life was further complicated by the Dutch theologian, Gisbert Voetius (1588-1676). Voetius had attacked Regius, a Dutch physician who taught medicine at the University of Utrecht, for his having taught certain "Cartesian" ideas that conflicted with traditional theological doctrine. Regius was friend to both Reneri and Descartes, and was a strong adherent to Descartes's philosophical views. Voetius tried to have Regius removed from his position as professor, while at the same time attacking Descartes's work and character. In his defense Descartes entered into the debate. The controversy would leave Regius confined to teaching medicine, forbidden to teach anything Cartesian, and his published defense of Cartesian thought would be officially condemned by Voetius, who in five years time would rise to the position of University rector. At the end of the debate, which off and on lasted about five years, the situation became desperate for Descartes. He feared being expelled from the country and of seeing his books burned. He would even seek protection by asking the Prince of Orange to intervene and quell Voetius' attack.

In 1643, at the age of forty-seven, Descartes moved to Egmond du Hoef. With the Voetius controversy seemingly behind him (though, as mentioned above, it would again raise its head and climax five years

down the road), Descartes and Princess Elizabeth of Bohemia began to correspond. In this exchange, Princess Elizabeth probed Descartes on the implications of his commitment to mind-body dualism. During this time, he completed a final draft of a new textbook, which he had begun three years earlier, the *Principia Philosophiae* (*Principles of Philosophy*), and in 1644 it was published. He dedicated it to Princess Elizabeth.

The *Principles* is an important text. The work is divided into four Parts, with five hundred and four articles. Part One develops Descartes's metaphysics. Although it would appear to be a quick run through of the *Meditations*, there are a number of dissimilarities. For example, the order of presentation of the proofs for God's existence, which some have argued is significant, found in the Third and Fifth Meditations, is reversed in the *Principles*. The principles introduced in Part Two are based on the metaphysics of Part One. And, the subsequent physics developed in Parts Three and Four is based upon the principles of Part Two. Although the physics turns out to be unsound, the *Principles* nevertheless inspired such great thinkers as Robert Boyle (1627-1691), Edmond Halley (1656-1742), and Isaac Newton. As an important side note, it must be stressed that even though Descartes had throughout his career put a great deal of emphasis on mathematics, the physics developed in the *Principles* is not a mathematical physics. Rather, it is a conceptual project with only a hint of empirical overtones-a physics rooted entirely in metaphysics. Two parts, never completed, were originally intended to deal with plants, animals, and man. In light of this and what Descartes says in a 31 January 1642 letter to the mathematician Constantijn Huygens, it is plausible to think that the *Principles* would have looked something like *The World* had it been completed as planned.

One of the more controversial positions the *Principles* forwarded, at least according to Newton, was that a vacuum was impossible. This followed from Descartes's commitment to the view that the essence of body was extension. Supposing that a vacuum was taken to be a "gap" between bodies-that is, it is taken to be an utter absence of body (matter)-if it turned out (as indeed it does) that this gap was extended in length, breadth, and depth, then it would not be an absence of body, but would by definition *be* a body-as much a body as the two bodies between which it is taken to be a gap. The corporeal universe was thus a plenum, individual bodies separated only by their surfaces. Newton argued in his *De Gravitatione* and *Principia* that the concept of motion becomes problematic if the universe is taken to be a plenum. Another controversial position was Descartes's insistence that matter is infinitely divisible. Gassendi, and later Cordemoy, argued that there must be a bottom, a "substance," to the physical universe upon which the being of all corporeal things depend. In line with the ancient atomist Epicurus, they argued that if matter was infinitely divisible, so dividing it would show that there was no bottom-and so, corporeality would not be substantial. So, if corporeality is substantial, as Descartes himself had claimed, there must be a minimum measure of extension that could not be divided (by natural means, anyway). And so, there are atoms. But, this conclusion was something that Descartes explicitly rejected in the *Principles*.

The *Passions*

In 1646, as a result of the probings of Princess Elizabeth, Descartes completed a working draft of *Passions de l'ame* (*Passions of the Soul*). During this year another prominent political figure began to

correspond with Descartes, Queen Christina of Sweden. And, Regius published what he took to be a new and improved version of Cartesian science, which as we now know would draw the wrath of Voetius. But Regius did not stop there, for he seemed to have found important differences between his "Cartesian" view and that of Descartes's, and attempted to separate the two, publishing a broadsheet that listed twenty-one anti-Cartesian theses (which his version of "Cartesian" science rejected). In response to this, Descartes wrote a single-page printed defense that was posted on public kiosks for all to read. Published in 1648, the *Notae in Programma Quoddam* (*Notes on a Program*-also referred to as *Comments on a Certain Broadsheet*) is Descartes's public defense. However, as mentioned earlier, tensions mounted as a result of the public exchange and Descartes felt his way of life in the Netherlands to be threatened. As luck would have it, an admirer and friend of Descartes's-Chanut, who worked for Queen Christina's court-and Queen Christina herself began probing Descartes about the possibility of coming to Sweden. And, after a not too lengthy correspondence, Queen Christina offered Descartes a position in her court. For many reasons, which would certanily include those related to his concerns about Voetius, Descartes accepted the offer. And, in 1649 he left for Sweden.

Queen Christina at first required very little from Descartes. However, according to Gaukroger, this would change. For, after he had some time to settle in, she ordered him to do two things: first, to put all of his papers in order, and secondly, to put together designs for an academy (Gaukroger, p. 415). Arguably, Descartes had some idea of how the latter might be done by way of his experience in Breda. In January of 1650 Queen Christina began to require Descartes to give her lessons in philosophy. These apparently would begin at five in the morning and would last for about five hours. They were given three days a week (Gaukroger, p. 415). During this time Descartes published the *Passions*, the work having emerged primarily from his correspondence with Princess Elizabeth (to whom he had dedicated the *Principles*). One aim of the *Passions* was to explain how the emotional (and thus moral) life of a human being was connected to the soul's being essentially united to a body. Simply put, a ’passion of the soul’ is a mental state (or thought) that arises as a direct result of brain activity. Such passions can move us to action. Since this is so, Descartes suggests that one needs to learn to control one's passions, for they can move one to perform vicious acts. Critics of Descartes, including Elizabeth, argued that Descartes's metaphysical commitments put real pressure on the view expounded in the *Passions*. For, according to Descartes's metaphysics, the nature of mind is to think and the nature of body is to be extended in length, breadth, and depth. One view concerning causation, a view that Descartes's critics seemed to have attributed to him, is that one thing causes another to move, for example, by way of contact. Contact,in this context, seems to be possible only by way of surfaces. Now, bodies, since they are extended and thus have surfaces, can come into contact with one another and thus can cause one another to move. However, if minds are not extended, they lack surfaces. And, if they lack surfaces, there is no way in principle for bodies to come into contact with them. Thus, there is no way in principle for bodies to move minds, and visa versa. That is, minds and bodies cannot in principle causally interact. And so, if the view expounded in the *Passions* requires that bodies and minds be capable of causal interaction, and Descartes's metaphysical commitments make such interaction impossible, Descartes's metaphysics puts a great deal of pressure on the view expounded in the *Passions*.

Although things seemed to be moving forward, they were not going as well as one would have hoped. In a letter to Bregy, for instance, dated 15 January 1650, Descartes expresses reservations about his decision

to come to Sweden. He sees himself to be "out of his element," the winter so harsh that "men's thoughts are frozen here, like the water" (AT V 467; CSMK III 383). Given the sentiment expressed in the letter, this remark was probably intended to be as much Descartes's take on the intellectual climate as it was about the weather. In early February, less than a month after writing Bregy, Descartes fell ill. His illness quickly turned into a serious respiratory infection. And, although at the end of a week he appeared to have made some movement towards recovery, things took a turn for the worse and he died in the early morning of 11 February 1650. He was fifty-three years old.

Bibliography

NOTE: In what follows, the Adam and Tannery volumes, *Oeuvres De Descartes*, 11 vols., are cited. Such citations are abbreviated as "AT," followed by the appropriate volume and page numbers. I have whenever possible used the Cottingham, Stoothoff, and Murdoch translation, *The Philosophical Writings Of Descartes*, 3 vols. Volume 3 includes Anthony Kenny as a translator. This has been abbreviated as "CSMK," followed by the appropriate volume and page numbers. The AT and CSMK numbers are cited, side by side, separated by a semicolon.]

Descartes' Law Thesis

Traditionally, scholars have paid little attention to Descartes's moral views, and even less to his legal and political views--this even though it is well known that he had earned a degree and license in Canon and Civil Law at Poitiers. Of course, an explanation for this is that Descartes wrote very little on such things. And so, the lack of attention is the direct result of a lack of text. However, in 1981, while reframing a seventeenth-century engraving that had been hanging in a museum restaurant, a curator for the Sainte-Croix Museum discovered a document that could change all of this. Stuffed in the back of the engraving was a small broadsheet, which was used by the original framer to secure the engraving in its frame. As was typical, such broadsheets were used to announce upcoming defenses and the theses of the candidates, the latter presented as a list of conclusions to be defended. After the defense dates had passed, the posters were discarded, and some found their way into the hands of framers who on occasion would use them as stuffing, as was the case here. The discovered 1616 broadsheet announced an upcoming (oral) thesis defense at the law school at Poitiers -- the defense of the law thesis of one Rene Descartes.

It wasn't until October of 1986 that the discovery would be officially documented in the *Archives departementales de la Vienne*, at Poitiers. And even though the existence of the document has been known for several years, very little has been done to bring the thesis and its contents to the attention of Descartes scholars. It is not included in the Adam and Tannery volumes. And, it is not included in any of the French or English translations of Descartes's work -- this, even though Jean-Robert Armogathe, Vincent Carraud, and Robert Feenstra have verified its authenticity. In fact, only one article appears that deals with the thesis in its entirety: an article published in 1988 in *Nouvelles De La Republique Des Lettres*, co-written by the three scholars just mentioned. The broadsheet (hereafter referred to as the "1616 Law Thesis") contains a title, an introductory discussion, and a list of forty conclusions to be defended. And, although the document is only a single page, it appears to be fruitful enough to support new and exciting projects in Descartes scholarship.

The *1616 Law Thesis* deals specifically with the legal concept of inheritance. Descartes's view concerning the transference of property from one generation to the next seems to foreshadow a view expounded in works to come -- for example, in the *Rules for the Direction of the Mind* (1628) and in the *Discourse on the Method* (1637). "Last Wills can be generally defined" he says, "as the ultimate rule by way of which inheritance is handed over" (*1616 Law Thesis*, my translation). This rule, he argues, is grounded in both Civil and Natural Law (Ibid.). The idea is that the property of one generation can be justifiably passed to the next by way of this rule. This, even though the Crown may have a claim to such property. The rule keeps the Crown from legally interfering with the transfer. In the *Rules* and *Discourse* we can find a parallel. Like the rule of inheritance, a rule (or a set of rules -- i.e., a method) must be used

to secure the transference of knowledge from one generation to the next, the rule (or rules) keeping authority from interfering with the transfer.

We learn in the *Discourse*, and later in the *Meditations*, that Descartes was dissatisfied with the 'knowledge' he had acquired as a child (at La Fleche). This dissatisfaction resulted in his search for a method that would guarantee knowledge. Traditionally, Descartes's insight into the need for a method is dated around 1619, and is said to have found expression in print for the first time, some eighteen years later, in the *Discourse*. However, the insight is found lurking about in the introductory paragraph of the *1616 Law Thesis*:

> I thought that while even a tender sprout that I was especially inquisitive, for while nearly all the youngsters cried as they departed their youth, I was devoted to the fountains, the wet milk of my step-mother -- the nectar of the liberal arts -- dripping from my lips. At first in fact, I, wonderfully delighted, muttered a noisy stream of flattery, strongly desiring to drink the stuff of the honey-flowing poet. But soon, my admiration for their [my teachers'] heavy clammer and voices produced in me a torrent of images in which I took refuge, in turn hiding from me the eloquent waters for which I had [originally] thirsted. And, not only did these things produce in me more of a thirst for knowledge than they could quench, but none of them ever really satisfied me. The [resulting] desolation of knowledge eventually leveled me, and I, at that point, began to search with great zeal for any streams that were more abundant than this other, and that flowed [perhaps] in a different direction. [At first I thought that] carrying out something so ambitious was certainly not insane, since I did not think that such an undertaking would wear me down, or judge that a single petty stream would wear me out. My hope was that I could root out some [of the streams] from the rest, the sweet drops of the former at last calming my nature. And, my hope was that all [of this] would be settled by way of proof.

The reference to streams in this passage is connected to a central metaphor of the *1616 Law Thesis*: the metaphor of the fountain. We find this metaphor used by Descartes in later works: *The World*, *Treatise on Man*, *Discourse*, and *Optics*, to name a few. It is used, for example, in explanations of light, force, motion, dynamic and mechanical processes, and animal behavior. It would seem that this metaphor, in addition to its being central to the *1616 Law Thesis*, is central to understanding Cartesian views on the dynamic processes of both mind and body. This suggests the use of a central 'picture' that runs throughout the entire Cartesian corpus, a picture that is first introduced in his law thesis at Poitiers.

CLARISSIMO VIRO

DOMINO D. RENATO BROCHARD,

DOMINO DES FONTAINES &c. IN PRAESIDA-

LI PICTONUM CURIA INTEGERRIMO SENATORI,

AVVUNCULO SUO PRAECIPUAE OBSERVANDO.

Renatus Des-Cartes I.V.Q. Licentiatus, S.P.D.

--Iuuat integros accedere fontes. Atque haurire: iuuatque nouos decerpere flores.

Quinimo cum ad te confugiam (AVUNCULE MIHI PLURIMUM OBSERVANDE) ad ipsummet integitatis fontem commodum me pervenisse existimo: ubi non solum fragrantissimis gloriae tuae floribus decorabor, --Sic ut nihil ipse futurae laudis agam. Sed ipsam quoque adolescentiam meam crudam adhuc & viridem, si dulcissimis virtutis tuae fontibus irrigetur, florere aliquando posse non despero. Sicut enim prata mollia, quo foelicioribus aquis imbuuntur eo magis daedala florum pulchritudine cumulantur: Sic certe humana ingenia eo magis florent quo dulciores scientiarum virtutisque haustus ebiberunt. Quod cum ipse dudum curiosa foelicitate cognouerim: pene a tenero aetatulae vaientis exitu, uda adhuc lacteo altricis rore balella nectareis liberalium artium fontibus applicaui. Et primo quide, leniter obstrepentis undae blandienti susurro mirifice delectatus, melliflous poeticae latices haurire gestiebam: mox graviorem strepitum, voceque torrentis ad instar decurrentes admiratus, latiroa eloquentiae flumina cupidissime sitiebam. Neque vero his, quae scilicet sciendi sitim dant potius quam sedant ullo vodo satiatus: Ipsum denique scientiarum aequor vastissimum atque ex illo rivos omnes quam uberrime diffluentes sagaci sedulitate perquirebam. Non quidem tam ambitiosa elatus insania, ut de tenuitatis meae captu non cogitans vel unicum alicuius disciplinae rivulum pentitus eshaurire me posse arbitrarer, sed aliqum prae caeteris electurus, cuius rore dulcissimo sitis ingenii mei leniretur in posterum, cupiebam onmes experimeno dignoscere. Neque me lassauit unquam tam laoriosa curiositas, donec ex te tandem adeo puos virtutm erudiionisuque fontes scaturire perspexi, ut exinde caeteros fastidiere, illosque dumtaxat tuos aestimare sectarique coeperim, hoc est (ne sermo forsitan meus incedat quasi per nebulam) te unum ex omnibus admirandum mihi imitandumque proposui. Tanta enim est vitae tuae puritas, tanta morum integritas, congressus suavitas, doctrinae ubertas, virtutis

claritas: ut nihil amplius ad fontis amoenissimi complementum possit exoptari. Quid enim? Anne ut leniter obstepat, --Et obliquo laboret Lympha fugax trepidare rivo? Cum scilicet istos virtutis tuae fontes, gratissimo famae murmure circumfluos, etiam nec uberis undae puritas argentae, nec arenae divitis splendor aureus, tantopere ad se pellexerunt. Sed apparuit hic mihi Nympha pulcherrima, non Artemis, qualem viderat olim infoelix Actaeon; se Themis, quae me quoque verum disparili prorsus ratione transmutauit, quippe non efferauit in ceruum, ut semel conspectae praesentiam in posterum meticulosa celeritate deuitarem: Sed ingenita prius liberate feroietem cicurauit in seruum, ut se perpetuo vitae meae tempore incensa cupiditate persequerer. Cum vero nunc preciue me eius amatorem cultoremque non indignum testari desiderem, te sane non immerito, in cuius pris fontibus, quasi in sacrario suo residet, placuit conuenire; ut tam amabilis Deae gratiam mihi benivolentiamque conciliare digneris.

Theses ex utroque iure de Testamentis ordinandis

1. TESTAMENTUM generaliter definiri potest, ultimum elogium, quo datur hereditas.
2. Huius summa divisio, nec vulgo satis observata, est in illud quod iuris civilis est, & illud quod iuris gentium.
3. Hoc enim a privata cuiuslibet dispositione vires accipit;
4. Illud ab authoritate publica.
5. Hoc sola voluntatis sufficienti declaratione perficitur:
6. Illud ominmoda iuris observatione.
7. Hoc denique facere possunt omnes, qui & de aliqua re disponere:
8. Illud vero ii soli quibus vel lex, vel princeps indulserit.
9. Quae idcirco distinximus, quia testamentum iuris gentium Potificio iure validum est.
10. Nec in eo solenitas ulla, sed sola naturalis aequitas attenditur.
11. Quod atuem iuris civilis est recte a Modestino deffinitur Voluntatis nostrae iusta sententia de eo, quod quis post mortem suam fiere velit.
12. Cuius faciendi potestatem non habent impuberes.
13. Nec filii familias, nequidem de bonis mere adventitiis; exceptis castrensibus, vel quasi castrensibus.
14. Nec de statu suo dubitantes, vel errantes.
15. Nec mente capti, aut furiosi.
16. Nec prodigi, quibus bonorum administratio interdicta est.
17. Nec capitali iudicio damnati, nisi pendente appellatione.
18. Nec quicunque serui sunt.
19. Nec denque ulli, quos leges improbos, intestabilesque esse iusserint.
20. Quales sunt haeretici, & qui eis fauent, si intra annum ex quo excommunicati sunt, satisfacere contempserint.
21. Hoc autem testamentum, quod iuris civilis est, fit vel iure communi, vel iure singulari.
22. Quod fit iure communi, vel nuncupatiuum est, vel in scriptis.
23. Quae divisio a solennitate in utroque diversa proficiscitur.
24. Quippe ad prioris solennitatem pertinet, ut illud testes omnes palam exaudiant.
25. Ideoque in illis sermonis intelligentia omnino requiritur.
26. Ad posterioris, ut subscribant simul, & annulo absignent.

27. Item ut litteris, non notis conscribatur.
28. Ad utriusque vero, ut septem idonei testes adhibeantur.
29. Qui rogati sint eius rei gratia.
30. Nec inuiti ad finem usque perseuerent.
31. Unoque contextu totum testamentum peragatur.
32. Legatarius autem etiam in nuncupativo testis est idoneus.
33. Here in neutro.

WITH THE MOST ILLUSTRIOUS MAN

LORD D. RENE BROCHARD,

LORD OF THE FOUNTAINS, ETC. A DEFENSE

AT THE POITIERS SENATE HOUSE WITH ALL THE SENATE,

HIS UNCLE IN SPECIAL ATTENDANCE.

Rene Descartes: Canon and Civil Law License [I.V.Q.], Gives salutations and peace [S.P.D.]

--*It pleases one to approach the pure fountains, and to drink, and to gather new flowers.*

Indeed, in taking refuge in you (my uncle, having seen much) I think that I have reached the pleasant fountain of integrity itself. Not only will I be adorned with the glorious fragrance of your flowers--*Thus I do nothing to bring about my coming glory*--but also my adolescence, still fresh and green, irrigated by your fountain of sweetest virtue, will blossom hereafter, and I cannot despair. Indeed, just as the gentle meadows whose foliage is drenched with water, on which a more variegated beauty of flowers is heaped, certainly human nature will the more flourish which drinks the sweet drink of knowledge and virtue.

I thought that while even a tender sprout that I was especially inquisitive, for while nearly all the youngsters cried as they departed their youth, I was devoted to the fountains, the wet milk of my step-mother--the nectar of the liberal arts--dripping from my lips. At first in fact, I, wonderfully delighted, muttered a noisy stream of flattery, strongly desiring to drink the stuff of the honey-flowing poet. But soon, my admiration for their heavy clamor and voices produced in me a torrent of images in which I took refuge, in turn hiding from me the eloquent waters for which I had [originally] thirsted. And, not only did these things produce in me more of a thirst for knowledge than they could quench, but none of them ever really satisfied me.

The [resulting] desolation of knowledge eventually leveled me, and I, at that point, began to search with great zeal for any streams that were more abundant than this other, and that flowed [perhaps even] in a different direction. [At first I thought that] carrying out something so ambitious was certainly not insane, since I did not think that such an undertaking would wear me down, or judge that a single petty stream

would wear me out. My hope was that I could root out some [of the streams] from the rest, the sweet drops of the former at last calming my nature. And, my hope was that all would be distinguished by way of [proof of] experience.

[I did not realize, however, how much] my ever so laborious inquisitiveness had worn me out until I had arrived at a [certain] place and had learned of pure virtue, having seen it gushing from the fountain. And, ever since then I disliked these other [streams], and I began to value and follow only that [stream] of yours, [Uncle], this (and not my speech that now advances us as if through a thick fog) I propose is the one thing itself from all others that I now admire and imitate. For great is the purity or your life, great the integrity of [your] character, great the sweetness of [your] social intercourse, great the abundance of [your] teaching, great the strength of [your] virtue: as nothing more of this most pleasant fountain can be longed for but to be filled up [by it].

For what? In order to gently make a noise--For am I not turned awry as it works, the speeding water that hurries along with the river? Certainly with respect to your fountains of virtue, the greatest gratitude overflows with the roar of public opinion, [and even] the minds of the envious allow it to be thought. Not only have these distinguished things so greatly attracted me, but the abundant surge [of water] is [surely] pure silver, and the richness of the sandy banks brilliant gold.

It is thus that my Maiden appears to be the most beautiful, not Artemis, who Actaeon saw naked, but Themis, who has by way of truly unequal straightforward reason changed me, not into a wild stag, where following I [like Acteaon] quickly avoid appearing visibly fearful. [Rather,] she tames through freedom the wildness implanted previously in the brute, without interruption, and at this the appropriate time has excited [in me] the desire to pursue my own life. And, since indeed it is not unfit for me to desire to testify concerning my lover and sustainer, [and that] you are not undeserving of that which is in the pure fountains--it residing as though in your sacred place--it is now especially pleasing [for us] to gather, and it is even more lovely to bring about your deeming worthy for the Goddess [her] favor and for me [my] kindness.

A THESIS FROM TWO SIDES OF LAW CONCERNING THE REGULATING OF LAST WILLS

1. Last Wills can be generally defined as the ultimate rule by way of which inheritance is handed over.
2. Of this final distribution [of property], not commonly enough observed, the Last Will is an ultimate rule because it is [contained in] both *ius civilis* (Civil Law) and *ius gentium* (Law of the Nations).
3. The latter (*ius gentium*) accepts the power [of a man] to dispose of private things.
4. The former (*ius civilis*) [accepts the same] from public authority.
5. The latter (*ius gentium*) grounds the execution of [one's last] will by way of a declaration.
6. The former (*ius civilis*) [concerning distribution by way of declaration] is in observance of the law in every way.
7. The latter (*ius gentium*), finally, makes it possible for all men to dispense of a thing in some

manner.

8. The former (*ius civilis*) indeed [supports the dispensing of] those [things] for which the law or a Prince allows.
9. Because a Last Will of *ius gentium* through Pontifical Law is valid, we therefore distinguish [those things] which [are so dispensed].
10. It is not any custom, but only an innate fairness [that] is attended [to].
11. NOT YET TRANSLATED
12. NOT YET TRANSLATED
13. NOT YET TRANSLATED
14. Concerning one's own position it is neither doubtful nor in error.
15. It is neither insane nor mad.
16. It is not extravagant, for which an administrating of good things is prohibited.

Robert Desgabets

Dom Robert Desgabets (1610-1678) was an earler defender and teacher of the Cartesian philosophy at St. Maur in the region of Lorraine, France. He was born in Ancemont and in 1636 became a monk in the Benedictine order. He taught theology at Saint-Evre at Toul between 1635-1655, and served as Procurer General of Mihiel to Paris during 1648-49. Although he is little-known today, he played an important role in the development and transmission of the Cartesian philosophy, especially in Paris and Toulouse. His major philosophical writings only appeared in print in 1983.[1] His contributions include pioneering work in the study of blood transfusion and mechanics, and his defence and developement of the Cartesian philosophy. His unusual marriage of Cartesianism and empiricism challenges many standard views of Descartes and the Cartesian philosophy.

Life and Writings

Although Robert Desgabets (1610-1678) is perhaps the most original of the Cartesian thinkers, even lauded by his most famous student, Pierre-Sylvain Régis, as "one of the greatest metaphysicians of our century," (Regis, 1704, p. 328.) only one book and two small works were published during his lifetime.[2] His correspondence indicates that he was interested in mechanics before 1644, well before being acquainted with Descartes; and for a metaphysical thinker like Desgabets, it was Descartes, not Galileo or Bacon, who offered a new and complete philosophic system. In Desgabets's estimation, the only legitimate rival system to Descartes's was the one developed by Pierre Gassendi, but in the final analysis, new scientific discoveries weighed decisively in Descartes's favor.

In 1658 Desgabets participated in the Cartesian conferences held at M. de Montmort's, where he

reportedly participated in discussions with Rohault, Clerselier, and Cordemoy. Desgabets delivered a lecture which outlined his invention of an apparatus and procedure for blood transfusion, but he seems to have abandoned its study shortly thereafter. In 1667, after a controversy erupted between the English and the French over who first invented the procedure, a physician by the name of Jean Denis was spurred to publish the written version of Desgabets's lecture. This appeared in 1668, four years after the physicians Clark and Henshaw of England had attempted the operation on animals without success. (Desgabets, 1668) Prior to this research, in 1656, Christopher Wren successfully injected medications directly into the veins of animals, after which in 1665, another Englishman and physician, Lower, a teacher and friend of John Locke, successfully injected blood into animals using this same method. Rodis-Lewis has sorted out many of the details of this history, and shows that the two procedures created by Lower and Desgabets are so different as to confirm the independence of their inventions. (Rodis-Lewis, 1974) But whether and when Desgabets experimented with his procedure has not been firmly established. What is evident, however, is that Desgabets, like Wren, was inspired by Harvey's discovery of the circulation of blood. Once Harvey had shown how the circulation of blood is best understood as a mechanism operating according to lawful movements, he opened the way for blood transfusion to be understood along similar lines, as a species of the communication of movement. Where evidence of Desgabets's actual experimentation with blood transfusion is lacking, his descriptions of it show that he was aware of the possibility of shock if the quantities transferred were too great for the subject. (Rodis-Lewis, 1974)

Throughout his lifetime he engaged in many theological and philosophical controversies with such distinguished seventeenth-century thinkers as Mabillon, Rapin, Foucher, Malebranche, Cordemoy, Arnauld and Poisson. One of his more famous interlocutors was the Cartesian Gérauld de Cordemoy (1626-1684). Despite his admiration for Cordemoy, Desgabets was shocked by the atomism in the *Discernement du corps et de l'âme* (1666), a copy of which had been sent to him by Clerselier in the year of its publication. This resulted in a letter written by Desgabets to Clerselier, opposing certain developments favourable to the existence of the void and against the infinite divisibility of extension. According to Desgabets, the marriage of Cartesian and anti-Cartesian elements in this work formed an irreconcilable schism in the Cartesian philosophy. Although Desgabets himself was not one to adopt Cartesianism in its entirety, in his view his own criticisms perfected and maintained the integrity of the Cartesian principles, while Cordemoy's adoption of atoms and the void was a direct affront to the Cartesian metaphysics.[3]

Another, much more scandalous interchange took place between Desgabets and Thomas Le Géant between 1671-1672 over Desgabets's thoughts on the Eucharist, which he stated in an anonymous work, the second of his publications, *Considérations sur l'état présent de la controverse touchant le T. S. Sacrement de l'autel* (1671). Lemaire credited this work with having been the primary cause of the persecution of Cartesianism in France, since it brought to light the incompatibility of the Cartesian philosophy with the official Church doctrine on the mystery of the Eucharist.(Lemaire, 1901, p. 124) Desgabets had entered this on-going debate in 1654 at Clerselier's request. Desgabets's intention was to defend the Cartesian doctrine of material substance against the Peripatetic doctrine of substantial forms in his explication of transubstantiation. Clerselier and Rohault had defended Descartes's ideas on the subject along similar lines, but no one had been willing, either privately or publicly, to argue as Desgabets eventually did, that the body of Christ is really extended in the host. In addition, Desgabets's

persistence and perhaps even imprudence, pushed the issue into the open. For, it was shortly after the publication of the anonymous *Considérations* in 1671, that Desgabets sent additional writings on the topic to Abbey Le Roi, who communicated them to Nicole and Arnauld. The latter found Desgabets's views dangerous and completely against tradition. It was through his acquaintance with Nicole and Arnauld, that the non-Cartesian Le Géant learned of the document and the identity of its author. Le Géant alerted the Procurer General of the Congregation of Benedictines, who ordered Desgabets to report to his superiors concerning the matter. This led to an interrogation and the subsequent issuance of an order on the 15th of December 1672, which demanded that Desgabets renounce his views on the Eucharist.(Armogathe, 1977, pp. 25-26) Desgabets promised to obey, and retreated to a monastery at Breuil. Fortunately this did not spell the end of his philosophical career, since the controversy attracted the attention of Cardinal de Retz, who was known for his radical spirit of reform among conservative ecclesiastics in France. Cardinal de Retz, who was a partisan of the new Cartesian philosophy, provided protection for Desgabets and invited him to the Cartesian conferences held at le Chateau de Commercy. It was here that Desgabets criticized and corrected what he saw as the errors of Descartes, and completed his "indefectibility thesis," which he had started in 1653-1654.

Desgabets's last published work, *Critique de la critique de la Recherche de la vérité* (1675), was intended as a defence of Malebranche against the sceptic Simon Foucher. However, Malebranche did not share this assessment, since he responded that though he was pleased with the person he found in Desgabets, he was not extremely pleased with the contents of his book; and that if one were to take on the defence of another, one ought to better know the other's thoughts. Desgabets himself was never to see Malebranche's scolding response which was published with the third edition of the *Search After Truth*, since Desgabets died at Breuil on March 13, 1678, just fourteen days before it appeared.

Desgabets's most important philosophical work, *Supplément à la philosophie de M. Descartes* (1675), was intended as a supplement to Descartes's *Meditations*. In this work, Desgabets examines many of Descartes's important doctrines and arguments. Desgabets defends the Cartesian doctrines of sensible qualities, matter, mind-body dualism, mind-body union and interaction in man while criticizing Descartes's argument for the *cogito* as the first principle of knowledge, the claim that there is such a process as pure intellection, that there are innate ideas, and that ideas have objective reality (pure possibility). What is particularly interesting is the central importance that Desgabets gives to the role of sensation in knowledge, and his development of Descartes's treatment of truth as both eternal and immutable but in some sense (one much contested in the literature) contingent. Desgabets more than once remarks in this work that "M. Descartes is not always a good Cartesian," which typifies his conviction that Cartesianism is more than the sum of the particulars set down by Descartes himself.

Viewing Desgabets's work as a whole, there is no doubt that what he viewed as a revision or perfection of the Cartesian philosophy others have viewed as a fundamental departure. In his favour, he never strayed from the Cartesian metaphysics, i.e., its substance dualism of mind and matter, substance-mode ontology, mind-body union and interaction, and the view that extension is the essence of matter and thought the essence of mind; and he remained loyal to the Cartesian physics against that of the atomists. However, heretically to some, he strongly rejected the rationalist epistemology which often dominates in Descartes, and argued that Descartes's own principles favour a form of empiricism.

Metaphysics

Despite the originality of many of Desgabets's ideas, he was orthodox in his Cartesianism. (Watson, 1966) Desgabets adhered strictly to Descartes's doctrine of matter as body extended in three dimensions. Physics, as Desgabets conceived it, was both mathematically and metaphysically grounded in the solid of the geometer. He also maintained the substance dualism of mind and matter while retaining their causal interaction. And he, like Descartes, insisted upon the substantial unity of man and the specificity of his nature and defended the Cartesian interpretation of ideas against such non-orthodox Cartesians as Malebranche. Although he claimed that the nature of the mind-body union is "the most impenetrable thing in the world," he had much to say about its sensory basis and its operations.

Desgabets subscribed completely to the Cartesian doctrine of matter which holds that matter is a substance extended in length, width and breadth. It was posited against the prevailing Peripatetic view which made reference to such things as substantial forms and prime matter in order to explain the permanence underlying the continuous change that matter undergoes. On Descartes's view, the essence of matter is its extension in three dimensions, and all of its changing attributes, properties and modes, such as movement, rest, figure, situation and composition of parts, are completely dependent upon and follow from this unified extension. (OPD 2: 27) Matter, or corporeal substance, is clearly known when it is viewed as the geometrical object of mathematicians, as a magnitude extended in length, width and breadth. Likewise, corporeal bodies are best viewed as the movements, rest, figures, arrangements and sizes of which corporeal substance is capable, and which, in its various diversifications and assemblages, "... now pass for the form of all particular bodies of which the world is composed." (OPD 1: 3) And, in all of this, "... there is nothing which is not governed by the laws of mechanics." (OPD 2: 4)

Furthermore, Desgabets viewed bodies as portions of matter, which in the case of animals are highly delicate and organized machines composed of an infinite number of parts capable of an infinite diversity of movements. He held this view against that of the Peripatetics who believed that there must be an internal principle of thought in beasts because of the intricacy and apparent human-like intelligence of their movements. According to Desgabets, the kind of thinking that attributes such an internal principle to beasts is the same kind of thinking that results in the attribution of intelligence to clocks, "However, the same affront to reason and philosophy is committed by the Americans and the Barbarians of the Orient who not being able to understand the mechanical reasons for the movement of clocks, or the true causes of natural effects, attribute souls and intelligence to machines, and likewise to fire, lakes etc., and in doing so expose themselves to the mockery of Europeans." (OPD 4: 132-133) In other words, no appeal to internal principles, or final causes is required to explain the movements of beasts, any more than it is needed to explain the movements of clocks. The complexity of movements, whether involved in the operations of clocks or those of animate bodies, is explicable in purely mechanistic terms.

Likewise, all motions communicated within or between material bodies are effected by physical contact and proceed according to the laws of local motion. Desgabets was careful to stress that the ultimate source of movement is not matter but God, who imparted it to the universe in its creation. For Desgabets,

it is this fact that grounds the laws of nature: "It is the constant and uniform manner of the action of God which founds these laws, by means of which He forms and maintains this beautiful harmony in the world which is one of the greatest objects of our sciences." (OPD 1: 13) As Desgabets saw it, the operation of these laws of nature and the rules of the communication of movement were the true and unique foundations of the new physics. In this respect, it can be seen how Descartes's account of mechanism and his distinction between principles of matter and principles of thought comport well with Desgabets's world view.

Desgabets also subscribed to the Cartesian conception of mind as an immaterial substance whose essence is thought. The distinction between mind and matter is thus a real and substantial one, impossible not to perceive: "Never has an infant asked for lies or truths for breakfast, nor has he imagined that the stones encountered along his path were the gross thoughts of some countryman." (OPD 5: 197) Minds, or immaterial substances, are of three kinds: uncreated, which is God; mind detached from body, which is an angel; and mind united with organized body, which is a reasonable soul. The second of these, angels, are the only pure minds in the created universe and they have no corporeal extension, no local presence or correspondence to time—they are simple and indivisible existence. Such minds or spirits cannot be perfected by any substantial union since their specific spiritual being does not require anything corporeal to carry out its functions. However, they are capable of participating in the movements of the visible world, though in doing so, they must undergo a kind of degradation and punishment in order to receive pain. The third of these spiritual beings is man, who consists of a cross between purely intellectual and purely corporeal things. In this Desgabets appears to have strayed slightly from the official Cartesian doctrine of dual substances, since he claimed that outside of God there are three sorts of simple created substances, matter or body, angel, and one which is composed of body and soul, which is man. However, this tripartite division of substances is supported by a more fundamental bipartite division of material and spiritual substances, so that man is best understood as a state of being which emerges out of the conjunction of two substances, rather than as a substance in the primary sense. This is not so unlike Descartes's account of man as a "composite entity" possessing two principle attributes, namely extension and thought, a being which itself is not a simple substance.

It was an important point for Desgabets that man, unlike angels, is a being composed of body *and* soul, who continually experiences the union of the two substances by the endless impressions he finds in himself. The relation of mind and body in man is an essential one which must not be regarded as a penal state of the soul, but as the *accomplishment* of its natural perfection. Human thought has duration, succession, a beginning and an end—qualities that depend on the movements of the corporeal organs and which follow the rules of local movement. Although Descartes and Malebranche after him claimed that the human mind is capable of detachment from the body, Degabets rejected this, since the human mind is not like an angel's but requires continual commerce with the senses for all its operations.

One further issue concerning Descartes's general account of the nature of the mind-body union, which Desgabets raised in order to dispel, concerns the common complaint that the Cartesian view fails to account for the interaction of material and immaterial substances. Desgabets did not regard this as a true problem because he thought that the question demanded the impossible—an explanation of how the organized body and reasonable soul, which are in fact made for each other, *can* exercise a mutual

commerce. He likened this to asking an artisan to explain how the convex surface of a peg *can possibly* fill that of a concave hole. Neither Descartes, nor the artisan could have an explanation for these states in terms of the four causes because they lay at the very foundation of metaphysics and relate directly to what Descartes identified as primitive notions. It is akin to asking why extension is the essence of body, or why thought is the essence of mind.

What could be understood, according to Desgabets, is the way in which the mind and body are united and dependent upon one another. He found an analogue in the nature of the body-body relation: two bodies are united when their superficies touch and their movements take on a mutual dependence. Similarly, two minds are united when their thoughts and wills agree and depend on one another. The union of mind and body is not by touch, nor by agreement of thoughts, but by the dependence that exists between certain thoughts and certain movements such that one in fact *follows from* the other. The union of the mind and body in man is so strict that it founds a species of communication for their commerce, in virtue of which our thoughts are said to have movement, duration, succession, etc., without themselves being corporeal. This, Desgabets insisted, is no more difficult to understand than how two surfaces, one concave and the other convex can be strictly united. Experience tells us that the mind and body depend upon one another in a mutual commerce, and their dependence is the essence of the nature of the mind-body union, and cannot be further reduced in explanation. In short, the essence of man, who is composed of mind and body, *is* the union of mind and body, and the only legitimate questions which concern this union relate to how, *given* the union, the mind determines the body and the body determines the mind, which is an empirical question. These hows must conform to the laws of local movement which apply equally to all created substances. As we will see, according to Desgabets, the mind depends on the movements of the sensory organs for its operation, from which result the modes of our thought consisting in duration, succession, and continuation; and the body depends upon the movements of the will, from which results the course of the voluntary movements of the body. Once the primacy of the mind-body union is recognized, it becomes clear that mind and body interact in virtue of the union. In fact, neither the mind nor the body move anything *per se*, but rather, they can only determine the course of movements in each other. For, recall that movement itself is imparted to the universe by God who is the only true author and "unique motor" of movement.

The metaphysics of human beings as modal beings whose nature depends upon the substantial union of mind and matter have some interesting epistemological consquences. For, it precludes the possibility of any detachement of the mind from the body, such as in pure intellection, since it would mean the destruction of the mind-body union, without which no process of thought would be possible. By man's nature, as a composite of two substances, the human mind depends upon the body for its operation just as the operation of the body depends upon the direction of the will.

Epistemology

In Desgabets's estimation, Descartes's truly great discovery was his identification of the true nature of sensible qualities. (OPD 5: 164) As Desgabets understood it, sensible qualities "... are nothing else in

objects but the local dispositions of the small parts from which result the sensations that we call heat, sound, light, etc."(OPD 2: 17) Moreover, sensible qualities *qua* modes of the mind have no resemblance or similarity to the modes or accidents of matter. Sensible qualities are states or modes of the human mind having only a causal relation to the specific local movements of our sensory organs, which in turn, are the effects of the local movements produced by the arrangements and local dispositions of parts of matter. Unfortunately, the ontological status of these qualities becomes less clear when they are considered as qualities in objects. In this context, for both Descartes and Desgabets, sensible qualities are "various dispositions" in objects. Since Descartes clearly held that sensible qualties are not the forms of material things but rather modes of the mind, the only sense in which sensible qualites could be "in" the various dispositions of objects is in the causal sense, that is, as their effects. While the status and nature of these dispositions in Descartes's account has been a subject of much debate, it is clear that he distinguished between such qualities as light, colour, smell, taste, sound and touch, which are sensed or perceived qualities, and other qualities, such as size, shape and motion, which are found in all bodies. Descartes wrote that the former qualities are dispositions which depend on size, shape and motion. So, it would seem that for Descartes, secondary qualities are sensible qualities bearing no resemblance to qualities of matter, while primary qualities are qualities belonging to physical objects.

The importance of this discovery and its interpretation in Desgabets's thought is paramount, since he believed that because of it, the way had been opened at last to lay the foundations of a true philosophy. Based on Descartes's conception of matter, and his consequent discovery of the true nature of sensible qualities, Desgabets concluded that our perception of sensible qualities and sensible objects does *not* constitute knowledge of the true state of exterior things. In fact, sensible qualities and objects considered in relation to their being as modes of the mind are not the true objects of knowledge or of science, since they are only modal beings subject to change. In this, Descartes would concur. But Desgabets went on to argue that all (true) knowledge depends on the senses, and hence on our perception of these sensible qualities and objects; this is a point of great contention in Descartes scholarship, and one of great significance in understanding Desgabets's marriage of Cartesianism and empiricism. The story is a somewhat complicated, yet intriguing one.

Desgabets claimed that the corporeal form of all particular bodies *results from* an *assemblage* of the local dispositions of matter, and that these dispositions of matter in turn come from extended matter. Thus, in the same way that sensible qualities are nothing outside us but the local dispositions of matter, sensible objects are nothing outside us but *assemblages* of local dispositions of matter. If sensible qualities such as heat, colour and light are really modes of the mind which have no resemblance to the modes or accidents of matter that cause them then, for the same reason, sensible bodies such as earth, water and animals must also be modes of the mind that have no resemblance to the assemblages of local dispositions of matter that cause them. This is a simple but perspicuous consequence of the Cartesian doctrine of sensible qualities and its conception of matter. It treats particular bodies as assemblages of local dispositions of matter, and it treats sensible bodies as our grasp of those assemblages. Hence, sensible bodies are beings of the mind which are merely caused by assemblages of local dispositions of matter. The analogy between sensible qualities such as heat, light etc., and sensible bodies such as earth, water, animals etc., is meant to be an exact one. Just as sensible qualities are the immediate effects of local dispositions of matter acting upon the senses, sensible bodies are the immediate effects of

assemblages of local dispositions of matter acting upon the senses.

Another important consequence of the true nature of sensible qualities is that the senses are not the source of error. This is a theme found in Descartes that depends on an important distinction between the scope of the two basic operations of the mind—that of the intellect and that of the will. The functions of assenting and dissenting are performed only by the will, while those of perception and conception are performed by the senses and intellect. For Desgabets, as for Descartes, simple conception is always true and conforms to its object, while error is a product of precipitous judgement. But unlike Descartes, Desgabets concluded that *everything* that is conceived of is a simple conception, not just God, soul and body. For Desgabets, a thing truly conceived, actually exists. Errors and so-called beings of reason which are said not to exist outside our conceptions, are not really conceptions, and are "... nothing but a false judgement which extends itself beyond perception. Likewise the failure that is often attributed to the senses is equally nothing but a precipitous judgement by which one says that the senses do not know." (OPD 6: 227) According to Desgabets, after having distinguished simple ideas from judgement in the *Third Meditation*, Descartes erred gravely in placing chimeras and other such beings of reason among the number of objects of simple conception. It was this that led to Descartes's fundamental error—the reversal of the basic truth that the first operation of the mind has only *real* things for its object. By including chimerical beings among the objects of conception Descartes opened the door to the possibility of thoughts without true objects. But, judgement or the extension of the will beyond the domain of what is conceived is the true source of chimeras and error. (OPD 4: 103)

All conceptions conform to their object, and error consists in the will forming a judgement beyond conception. On this point, Desgabets's account of error looks very much like that found in Descartes. However, in Desgabets, the domain of simple conception is less restricted, as is the proper function of the senses. The senses not only serve to determine what is good or harmful in life, but they also serve in knowing the nature of things. However, we often form false judgements of the true nature of the movements experienced by the senses because of their role in preserving life. (OPD 6: 228) On Desgabets's account, it is because the senses serve to promote the preservation of our life by telling us immediately which particular bodies are harmful or profitable that they can not also provide *immediate knowledge* of the true nature of these movements that impinge upon us. If the senses were such that they gave us immediate knowledge of the true nature of the movements impinging upon them, then they could not tell us *at the same time* what particular bodies are good or harmful to us. Thoughts are successive, and so the senses, in order to preserve life by warding off immediate and unexpected dangers, must be able to respond first and foremost to the preservation value of a particular object.

This does not mean that the senses cannot penetrate the true nature of things as well. In fact, for Desgabets, since all knowledge comes from the senses, the function of knowing the essences of things is a necessary role served by the senses. Recall that the true nature of particular objects consists in the local dispositions of parts of matter which produce the course of the movements we experience. These movements are the first and sole contact we have with the material world, and so the senses present, in some form, not only the existence of a given object, but first and foremost, the value of that object in relation to our survival. We only reach knowledge of the true nature of material objects by considering their being in relation to their substance. In order to achieve this, we must abstract from all relations of

time, and only then see it as it is in itself. What the senses offer us is knowledge of matter in its various divisions, shapes, sizes, etc., that is, as matter exists at a certain time and place. Thus, what Desgabets seemed to have assumed was that the reason we so often err with regard to the true nature of these movements is that we judge precipitously, or too quickly, before the mind has had a chance to conceive of material substance as it is in itself, independent of any temporal or spatial ties. Worth noting is that Desgabets's explanation for the mind's natural tendency to judge precipitously derives from the other function of the senses, namely, to immediately grasp the preservation value of a given object.

But what on Desgabets's account is the difference between a simple conception and a precipitous judgement? What is the criterion for distinguishing one from the other? In his *Supplément*, he offers the example of imaginary space. When we speak of imaginary space, many are persuaded that it does not include any judgement on their part, but if one looks closely, one sees that the simple object of conception here is space and extension with its perceived dimensions *from which* we form a judgement concerning its imaginary nature. Similarly, when someone approaches fire and has the sensation of heat, pain or pleasure, he may be persuaded that the heat he feels is in the fire just as he perceives it, since this sensation is known to him clearly. But, he has erred because of a tacit judgement. His conception of the fire and of the heat, as well as of his intervening judgement are all the immediate and true objects of his thought. These all qualify as simple conceptions in so far as they relate to their true object. But, that the heat is in the fire by which it is claimed that the heat in us resembles that of the fire, is a tacit judgement which is false. In this sense, the illusions that are attributed to the senses always involve false judgement. It is a genuine question to ask about a baton partially submerged in water whether it is straight or curved, but whether the baton, straightness, curvature etc., are real things, is not. Simple conceptions are the mind's grasp of things as they are in themselves, which is to say, in relation to their essence as extended substances, or as thinking minds. Space, as an attribute of matter, is extended in three dimensions, and sensations, as attributes of the mind, are perceptions not qualities of material objects.

This explains what Desgabets meant by his claim that all simple conceptions always have an existent object outside the understanding, since simple conceptions are, in virtue of their relation to substances, *of* things which actually exist. It is only when one judges of things outside one's conception that one is erroneously said to conceive something which does not exist. The task in the search after truth, then, is to separate precipitous judgements from judgements based only on what is *simply*, and hence, actually conceived.

Desgabets drew yet another, final consequence from Descartes's discovery of the true nature of sensible qualities (and bodies). This consquence bears directly on our ability to see the right path to a true physics which was hitherto impossible. The true physics is one that recognizes that "everything that happens in matter by the different movements and modes of its parts, belongs to mathematics and mechanics, which have all of this for their object." (OPD 5: 166) The object of the true physics is not the substantial forms of the Scholastics, but matter whose essence is extension, and its modes which are nothing else but various divisions and groupings of its parts. Thus, the natural object of the physcists is the same as the solid of the mathematician. The solid of the mathematicians, according to Desgabets, consists in a magnitude that has three dimensions, i.e., length, width, and thickness while the natural body of the physicist consists in a solid substance extended in three dimensions. This is the crowning statement of

Desgabets's metaphysical view that the physical world is *really* a single object or substance whose parts, under various divisions, shapes and arrangements, form all the *appearances* in the "grand theatre of nature." (OPD 5: 166)

This, of course, does not make the world, or its particular inhabitants any less real (or any more phenomenal) in Desgabets's view. Quite to the contrary, Desgabets thought that the foundation he had laid out supports the natural realist in each of us. The individuation of matter into sensible objects is a mode of thought in so far as the mind gives particular objects (local assemblages of dispositions of matter) their extrinsic form, but that such conceived or known objects actually exist outside the understanding by an intrinsic form, as modes or states of matter.

In Part 1, chapter three of the *Supplément*, Desgabets explicitly examines Descartes's rejection of the empiricist motto, that all knowledge comes from the senses. While Desgabets rejects the Scholastic rendering of the motto, he is equally critical of Descartes's precipitous evaluation of it. According to Desgabets, the proper sense of the empiricist motto is that all thoughts *originate* by the senses [*a sensu*] rather than in the senses [*in sensu*], and what reaches the intellect is not what is found in the senses. The soul must always be in commerce with the senses, and though our thoughts depend on the corporeal traces in the brain for their source or origin, it does not follow that our ideas must be corporeal, or even similar to corporeal things. The very fact that all of our thoughts have a beginning, duration, cessation, and sucession proves that they depend on motion, and motion is only communicated through the senses. This is why he modifies the empiricist motto from: *nihil est in intellectu quin prius fuerit in sensu*, to *a sensu*.

It is not surprising then, that Desgabets argued against Descartes's "pretention" that he could detach himself from all commerce with the senses, which sets the rationalist tone of the *Meditations*. Of course, Descartes saw this detachment as desirable because he thought it was in virtue of it that he could defend the certainty of human knowledge. He thought that the soul is known more clearly than the body because we, as thinking things, are intimately tied to the immaterial, thinking substance, which is our soul. The body, on the other hand, is part of material not immaterial substance, and so is not known immediately. It is because of this that Descartes erroneously took the *cogito* to be the foundation of certainty in human knowledge, and our knowledge of body to be less clear and less immediate. But had Descartes reflected more closely on the intimate union of the mind and body in man, he would have concluded with Desgabets, that our ideas of body and mind are equally clear, and equally evident. For, the soul of man is not an immaterial substance, but a result of the union of mind and body, and all our ideas, even of the soul, equally depend upon the operation of the senses. The new foundation of certainty in Desgabets's scheme is the principle of intentionality, from which Desgabets claimed to have demonstrably derived the principle of clarity and distinctness.

Despite Descartes's errors on this point, Desgabets claimed to have drawn the empiricist thesis out of Descartes's own principles. For, though Descartes had erroneously persuaded himself that the body had no part in metaphysical reasoning, Desgabets insisted that this does not mean that Descartes advocated the extravagant opinion that man has a pure mind. In other words, although Descartes held the mistaken view that the mind is capable of pure intellection, he did not hold its metaphysical counterpart—that man

is a pure mind. Descartes rightly viewed the metaphysical nature of man to be an essential mind-body union. In fact, Descartes himself proves that the soul is united to the body in the course of the *Meditations*. It is because Descartes and Malebranche did not attend closely enough to this latter truth concerning the mutual dependence of the soul and the body in their consideration of the nature of metaphysical reasoning that they erred with respect to the senses.

According to Desgabets, both Descartes and Malebranche rejected the empiricist thesis because they erroneously thought that it would commit them to the materialist thesis that thoughts and the soul are material. This led them to adopt the intellectualist thesis, or what we would call the rationalist thesis, regarding the mind's perception of metaphysical essences. However, Desgabets saw a third option, one which is founded on the mind-body union and the sensory basis of all knowledge, and one which founds the proper sense of the empiricist motto, that all ideas originate by the senses.

According to Desgabets, it is undeniable that man is a being who reasons, draws consequences, does not see things indivisibly, who has thoughts in succession which begin, continue, and finish, and who often experiences doubt and conjecture. Such doubting, discursive reasoning and succession of thought prove that all thought is tied to the body since duration and successive extension are nothing but the local movements of the body. (OPD 7: 299) A pure thought, the kind that Descartes (and Malebranche after him) envisioned for metaphysical reasoning, would have no beginning, duration, end, or succession. In short, such a thought would be indivisible, and hence unthinkable by the human mind.

Desgabets, having declared that all thoughts depend on movement, was especially concerned to defend his empiricist thesis against charges of materialism. Since movement is a mode which belongs to body, many tended to conclude that if minds depend on movement, then minds must have something corporeal in them. How could it be that our thoughts, which have something corporeal in them, namely, movement, are not themselves corporeal? And yet, this is exactly what Desgabets argued. He believed that thoughts have something corporeal in their being without themselves being corporeal—in the same way that every object in our thought has a beginning, continuation, and end without these objects having duration in themselves. While things really have duration, it is only *extrinsically* and by thought, "the same way a pole is divided into ten feet when one imagines the ten feet." (OPD 7: 299)

At first glance, Desgabets's analogy between attributing a corporeal nature to thoughts and attributing a duration or division to things serves more to confuse than clarify. But if we draw on his earlier point about the true nature of individual bodies, we can make some sense of it. Recall that individual bodies are real in that they result from the causal effect of assemblages of local dispositions of parts of matter acting on our sensory organs which in turn act on the mind. But the *individuation* of matter into *sensible* bodies is essentially an operation performed by thought, even though it has its foundation in the local dispositions of matter itself. For example, our perception of a ten foot pole is the effect of a specific assemblage of local dispositions of matter acting upon our sensory organs at a certain time *and* the imagination's division of that local disposition into ten feet. The local disposition itself is not intrinsically a pole, or ten feet long, but it is so extrinsically, that is, by thought. Similarly, thoughts themselves are not intrinsically extended or subject to movement, but they are so extrinsically, that is, as an effect of the operations of the sensory organs of the body. In other words, just as the local movements of matter

individuate thought extrinsically giving the mind individual thoughts, the thought of immaterial substance individuates matter extrinsically thereby giving it individual bodies. The mind-body union and the essential intentionality which results from it create the mutual dependence of the operations of mind and matter without requiring that mind be material or matter be immaterial.

This is at the heart of Desgabets's "fundamental truth," that for the proper use of reason we must recognize that all our ideas or simple conceptions have a real object outside of it, which is in itself what is represented by thought, and which actually contains the degree of being that one sees there. If individual and sensible objects are modal beings in the sense claimed by Desgabets then there is no cleavage between object and object known because they are one and the same thing. What is represented to our thought is the real object of knowledge, namely, material and spiritual substance, but what we sense are these substances as they exist in time, or in other words, as they exist at a given time *by thought* in virtue of the particular local dispositions of matter. It explains the sense in which objects thought of are objects actually existing outside the mind, since they are nothing more than the direct and immediate effect of actions produced in us by assemblages of local dispositions of matter.

Truth

According to Desgabets, Descartes's fine doctrine concerning the creation of the eternal truths, is the foundation of the true (Cartesian) philosophy. He claimed that had Descartes attended consistently to this doctrine, he would have avoided all error. Although there is a great deal of controversy surrounding the interpretation and significance of this doctrine, as Desgabets understood it, it requires that God be equally the author of all created things, in their being and their essence. It requires that there be no essence without existence, which is to say, that there can be no purely possible beings either in the human mind as in Descartes, or in God's mind, as in Malebranche. The notion that such truths are in some way prior to God's creation of the world, existing as purely possible essences separate from actual existence, involves a separation of essence from existence, and supposes that essence is something actually separable and conceivable without existence.

But, as Descartes recognized, the distinction between essence and existence is a distinction of reason; essence is the nature of a thing as it is contained in its definition, and existence is the perfection by which this essence actually exists which is possessed by the action of the Creator. According to Desgabets's account of the creation doctrine, "... objects precede truth in the order of nature," such that, "... it is impossible that the whole be greater than its part if there is no whole or parts, which is to say in a word, that our principle is found yet more true, and it is impossible to think of nothing." (OPD 6: 232) The principle Desgabets refered to here is the principle of intentionality, which states that every idea is an idea of some thing which exists as it is represented by thought. Becauses objects precede truth in the order of nature, to think of an object is to think of something that really exists. The correspondence of our thoughts to reality, that is the truth of our ideas, depends on something that actually exists and not on something independent of existence.

Truth, which exists only by the relation of conformity of thought to its object, is contingent in that it

depends on God's will in his free creation of the universe. Truth is eternal in its independence from time or temporal variations, and it is immutable in that once God wills the world, things never change in respect to their substance but only in respect to their modes of being. Although we must wait to know what things God actually created, we are guaranteed of the truth of our ideas since it is the object itself that determines what we perceive. Truth is necessary in that God gives all objects He creates an irrevocable being, but it is contingent in relation to His absolute and unlimited power. God is the equal author of the essence and the existence of things He created, He "... gave them their essence and their existence which are equally contingent, and which once received, are nevertheless possessed by them irrevocably." (OPD 6: 249) Desgabets's voluntarism, then, is a qualified one, for though the eternal truths depend upon God for their existence as their primary cause, they are no less indefectible, that is, they are unchangeable in their substantial being.

Bibliography

Primary Texts

- Cordemoy, Gérauld de. (1968) *Oeuvres philosophiques*, eds. Pierre Clair & François Girbal, Paris: Presses Universitaires de France. [This work includes letter written by Desgabets (1666) in which he argued against the atomist thesis of Cordemoy.]
- --------. (1666) *Discernement du corps et de l'âme*, Paris.
- Desgabets, Robert. (1668) "Discourse de la communication ou transfusion du sang," published with, "Lettre ècrite à M. Sorbière," by J. B. Denis, Paris. [This is a scientific piece in which Desgabets described an apparatus and procedure for blood transfusion of his own invention.]
- --------. (1671) *Considérations sur l'état présent de la controverse touchant le Très Saint-Sacrement de l'autel*, published anonymously, Holland. [This is the work that stirred a great deal of controversy for Cartesians, which is not surprising given the theologically sensitive nature of the thesis that the body of Christ is actually present (extended) in the host.]
- --------. (1675) *Critique de la Critique de la Recherche de la vérité*, Paris.
- --------. (1983) *Oeuvres philosophiques inédites*, Analecta Cartesiana 2, ed., J. Beaude with introduction by G. Rodis-Lewis, Amsterdam: Quadratures.
- Régis, Pierre-Sylvain. (1704) *L'usage de la raison et de la foi*, Paris.

Stanford Encyclopedia of Philosophy
Notes to Robert Desgabets

Notes

1. Dom Robert Desgabets (1983), *Oeuvres philosophiques inédites*, Analecta Cartesiana 2, ed., J. Beaude with introduction by G. Rodis-Lewis, Amsterdam: Quadratures. This essential but not widely available collection of Desgabets's philosophical writings comes in 7 opuscules; it includes works that previously existed only in manuscript, *Traité de l'indéfectibilité des créatures* (c. 1653-74), *Supplément à la philosophie de M. Descartes* (1675), *Guide de la raison naturelle* (1671), and *Traité de l'union de l'âme et du corps*. This work will be referred to by abbreviated title, OPD, opuscule number, and page number. The page numbering is continuous from opuscule to opuscule. For example, OPD 5: 152, refers to *Oeuvres philosophiques inédites*, opuscule 5, page 152.

2. All three published works were published anonymously: Dom R. Desgabets *Critique de la critique de la Recherche de la vérité,* (Paris, 1675); *Discours de la communication ou transfusion du sang* (Paris, 1668); and *Considérations sur l'état présent de la controverse touchant le T. S. Sacrement de l'autel* (Paris, 1671).

3. This letter, "Une lettre de D. Robert Desgabets à D. Jean Mabillon sur la question des azymes" is printed in: *Oeuvres des Mabillon et de D. Thierri-Ruinart* (Paris, 1724).

Nicolas Malebranche

The French Cartesian Nicolas Malebranche was hailed by his contemporary, Pierre Bayle, as "the premier philosopher of our age." Over the course of his philosophical career, Malebranche published major works on metaphysics, theology, and ethics, as well as studies of optics, the laws of motion and the nature of color. He is known principally for offering a highly original synthesis of the views of his intellectual heroes, St. Augustine and René Descartes. Two distinctive results of this synthesis are Malebranche's doctrine that we see bodies through ideas in God and his occasionalist conclusion that God is the only real cause.

1. Life and Works

Malebranche was born in Paris on August 6, 1638, one month prior to Louis XIV, and died, also in Paris, on October 13, 1715, six weeks after the great French monarch. Malebranche was one of many children born to his mother, Catherine de Lauzon, the sister of a Viceroy of Canada, and his father, also Nicolas Malebranche, a secretary to Louis XIII. As in the case of Descartes and Pascal, Malebranche was born in frail health. His particular affliction was a severe malformation of the spine, and due to this condition as well as his weak lungs he needed to be tutored at home until the age of sixteen. Subsequently he was a student at the Collège de la Marche, and after graduating he went to study theology at the Sorbonne. His education left him with a distaste for a scholasticism that focused on the work of Aristotle. Thus, in 1660 he decided to leave the universities and to enter the Oratory, a religious congregation founded in 1611 by the Augustinian theologian Pierre Bérulle (1575-1629). At the Oratory in Paris, Malebranche studied

ecclesiastical history, linguistics, and the Bible, and with his fellow students also immersed himself in the work of Augustine. He was ordained a priest on September 14, 1664.

The same year he was ordained, Malebranche happened in a Paris bookstall upon a posthumous edition of Descartes's *Traité de l'homme* (*Treatise on Man*) which provides a sketch of a mechanistic account of the physiology of the human body. Malebranche's early biographer, Father Yves André, reported that he was so “ecstatic” on reading this account that he experienced “such violent palpitations of the heart that he was obliged to leave his book at frequent intervals, and to interrupt his reading of it in order to breathe more easily” (André 1970, 11-12). While André does not indicate why Malebranche was so moved, one can speculate that he had discovered in this text a way to investigate the natural world without relying on a stagnant Aristotelian scholasticism. In any case, after his encounter with *L'homme* Malebranche devoted himself to a decade-long study of the Cartesian method and its results in mathematics and natural philosophy.

The fruit of this study is a two-volume work bearing the title, *De la recherche de la vérité. Où l'on traitte de la nature de l'esprit de l'homme, et de l'usage qu'il en doit faire pour eviter l'erreur dans les sciences* (*Search after Truth. In which is treated the nature of the human mind and the use that must be made of it to avoid error in the sciences*) (1674-75). It is primarily this text which provides the basis for Malebranche's reputation in the modern period. As its full title indicates, the *Recherche* focuses on the principal sources of human error and on the method for avoiding those errors and for finding the truth. The first five books enumerate the various errors deriving from the senses, imagination, pure understanding, inclinations and passions, respectively, and a sixth book is devoted to the Cartesian method of avoiding such errors through attention to clear and distinct ideas. The centerpiece of the third book, on pure understanding, is a defense of the claim that the ideas through which we perceive bodies exist in God. Tucked away in the final book, on method, is a critique of “the most dangerous error of the ancients,” namely, the Aristotelian position that there are secondary causes in nature distinct from God.

The first volume of the *Recherche*, containing the first three books, drew an immediate response in 1675 from the abbé Simon Foucher (1644-1696), canon of Sainte Chapelle of Dijon. Foucher was an “academic skeptic” who attacked the assumption that ideas in us can represent objects distinct from us (see Foucher 1969). The Cartesian Benedictine Robert Desgabets (1610-1678) replied to Foucher by insisting that the Cartesian rule that clear and distinct ideas are true presupposes that our thoughts correspond to real external objects. In brief prefaces added to the second volume of the *Recherche*, Malebranche chastised both thinkers for failing to read the work they were discussing, noting in particular that he had explicitly argued in the *Recherche* that the ideas we perceive exist in God rather than in us.

Malebranche solicited written responses to the *Recherche* modeled on the sets of objections published with Descartes's *Meditations*. Perhaps put off by Malebranche's harsh treatment of Foucher and Desgabets, his critics offered instead only informal objections channeled through mutual friends. In 1678, Malebranche appended to the *Recherche* a set of sixteen *Eclaircissements*, or clarifications, that respond to these objections. Among the more important objections addressed are those that concern Malebranche's assertion that we have a freedom to “consent” to certain motives for action

(“Eclaircissement I”), his claim that reason provides no conclusive demonstration of the existence of the material world (“Eclaircissement VI”), his doctrine of the vision of ideas in God (“Eclaircissement X”), his conclusion that we know our own soul through a confused consciousness rather than through a clear idea of its nature (“Eclaircissement XI”), and his occasionalist thesis that God is the only true cause (“Eclaircissement XV”). In the 1678 edition there is a final Eclaircissement that defends the importance “not only for knowledge of nature but also for knowledge of religion and morals” of the view, only hinted at in the *Recherche*, that God acts for the most part through “general volitions” (*volontez générales*) and acts though “particular volitions” (*volontez particulières*) only in the exceptional case of miracles.

Malebranche developed this last point in his 1680 *Traité de la nature et de la grâce* (*Treatise on Nature and Grace*). He published this work over the objections of the Jansenist theologian and Cartesian philosopher Antoine Arnauld (1612-1694), who was disturbed by what he saw as Malebranche's denial of the assertion in the Scriptures and the tradition of God's attention to particular details in matters of grace. Arnauld's responded to the publication of *Nature et grâce* by engaging in open combat, and the ensuing battle became one of the major intellectual events of the day. His opening salvo was the 1683 *Des vraies et des fausses idées* (*On True and False Ideas*), which attacks not *Nature et grâce* but rather the *Recherche* (see Arnauld 1990). Arnauld's strategy here was to undermine Malebranche's influence in theological matters by revealing the inadequacy of his philosophical views. In particular, he attacked Malebranche's assumption that ideas are “representative beings” distinct from our perceptions, offering instead the position, which he plausibly ascribed to Descartes, that ideas are simply a feature of the perceptual modifications of our soul. This argument reflects a sympathy for Descartes' views that dates back to Arnauld's set of comments on the *Meditations*.

The same year that Arnauld presented his initial critique, Malebranche published the *Méditations chretiennes et métaphysiques* (*Christian and Metaphysical Meditations*), where “the Word” (i.e., the Second Person of the Trinity) offers a summary of his system that highlights the central role that God plays in both metaphysics and morality. This work was in some ways a follow up to his *Conversations chrétiennes* (*Christian Conversations*), published in 1677. In that earlier text, Malebranche presented a defense of the Christian religion that emphasizes the Augustinian theme of our dependence on God for knowledge and happiness. In 1684, Malebranche further developed his views on moral theory in the *Traité de morale* (*Treatise on Ethics*), in which he argued that moral virtue requires a love of the “immutable order” that God reveals to those who seek to know it.

In 1684, Malebranche also responded to Arnauld's *Idées*, and after a further exchange on the topic of the nature of ideas the debate turned to the religious issues of divine providence, grace and miracles. The battle became increasingly bitter, and as a result of a campaign on the part of Arnauld and his supporters, Malebranche's *Nature et grâce* was put on the Catholic *Index librorum prohibitorum* (*Index of Prohibited Books*) in 1690 (the *Recherche* was added in 1709). The Malebranche-Arnauld polemic continued even after Arnauld's death in 1694, with the posthumous publication of two letters from Arnauld in 1699 and of Malebranche's responses to those letters in 1704.

In 1688, Malebranche published his *Entretiens sur la métaphysique et la religion* (*Dialogues on*

Metaphysics and Religion), a concise summary of his main metaphysical doctrines of the vision in God and occasionalism that also addresses the problem of evil. In 1696, he appended to this text the *Entretiens sur la mort* (*Dialogues on Death*), which he composed after a life-threatening illness.

In 1692, Malebranche published a short study, the *Lois de la communication des mouvements* (*Laws of the Communication of Motions*), in which he endorsed Descartes's law of the conservation of the quantity of motion but offered rules governing collision that, unlike Descartes's own rules, involve no appeal to a force in bodies to remain at rest. In correspondence with Malebranche, Gottfried Wilhelm Leibniz (1646-1716) emphasized difficulties with Descartes's conservation law, and that correspondence led Malebranche to insert into a 1700 edition of the *Lois* that experience reveals that this law does not hold.

In 1693, Malebranche responded to the criticisms of the *Recherche* in the 1690 *Systême de philosophie* (*System of Philosophy*) of the French Cartesian Pierre-Sylvain Régis (1632-1707). Régis had defended an account of ideas similar to the one that Arnauld had defended against Malebranche during the 1680s, and Arnauld used the Régis-Malebranche exchange as an occasion to return to the issue of ideas during the last year of his life. Despite their dispute, Malebranche and Régis were both appointed as honorary members of this organization when it was reorganized in 1699. Malebranche presented an inaugural lecture to the Académie that defends against Descartes an account of color in terms of the frequency of vibrations of light. In later published versions of the lecture, Malebranche revised his discussion to take into account the theory of the nature of color in the work of Sir Isaac Newton.

In 1699, Malebranche also published the *Traité de l'amour de Dieu* (*Treatise on the Love of God*) with *Trois lettres à Lamy* (*Three Letters to Lamy*), in which he rejected the claim in the Benedictine François Lamy (1636-1711) that the *Traité de morale* supports the quietist position that moral action derives from a disinterested “pure love of God.” This rejection of Lamy's quietism provided the basis for Malebranche's reconciliation with the famous French cleric, Jacques-Bénigne Bossuet (1627-1704). Bossuet had earlier enlisted the aid of François de Fénelon (1651-1715) in writing against Malebranche's occasionalism and his appeals to God's “general will,” but later became a bitter enemy of Fénelon's quietism.

With the support of the apostolic vicar in China, Malebranche published in 1708 an *Entretien d'un philosophe chrétien et d'un philosophe chinois, sur l'existence et la nature de Dieu* (*Dialogue between a Christian Philosopher and a Chinese Philosopher on the Existence and Nature of God*). A sixth and last edition of the *Recherche* appeared in 1712, and in 1715 Malebranche published his final work, *Réflexions sur la prémotion physique* (*Reflections on Physical Premotion*), in which he responded to the claim of the abbé Laurent-François Boursier (1679-1749) that occasionalism leads naturally to the Thomistic position that God determines our action by means of a “physical premotion.” In his response, Malebranche defended the claim, present from the first edition of the *Recherche*, that our free action involves a “consent” that God does not determine.

Malebranche (1958-84), which consists of 20 volumes, is the standard critical edition of Malebranche's writings. The increasing popularity of Malebranche in the English language literature is indicated by the

presence of recent English translations of his writings; see Malebranche (1980a), Malebranche (1980b), Malebranche (1993), Malebranche (1997a), and Malebranche (1997b). Easton, Lennon and Sebba (1991) is a comprehensive bibliography of work on Malebranche in various languages. This work supersedes the bibliography in volume 20 of Malebranche (1958-84), which had superseded Sebba (1959).

2. Ideas and the Vision in God

In a section of the third book of the *Recherche* devoted to “the nature of ideas,” Malebranche argued for his famous doctrine of the vision in God. More precisely, the thesis in this section is that we see external objects by means of ideas in God. The argument for this thesis begins with the claim at the beginning of this section that “everyone agrees that we do not perceive objects external to us by themselves” since it can hardly be the case that “the soul should leave the body to stroll about the heavens to see the objects present there” (Malebranche 1958-84, 1:413). Arnauld later took exception to this starting point, countering that “ideas, taken in the sense of representative beings, distinct from perceptions, are not needed by our soul in order to see bodies” (Arnauld 1990, 18). His main objection is that Malebranche stacked the deck in favor of his doctrine that we see ideas of bodies in God by assuming from the start that these ideas are distinct from our own perceptions.

In developing his own position, Arnauld appealed to Descartes' distinction in “Meditation III” between the formal reality of an idea as a perceptual modification of mind and its objective reality as something that represents an object. Arnauld insisted that a representative idea is simply the objective reality of a perception, and thus not something distinct from that perception. However, it is important to note that Malebranche's definition of an idea does not rule out such a position from the start. As he himself insisted to Arnauld, the claim that we must perceive external objects through ideas leaves open the question of whether an idea is “*a modality of the soul*, according to the opinion of M. Arnauld; an *express species*, according to certain philosophers, or an *entity created with the soul*, according to others; or finally *intelligible extension rendered sensible by color or light*, according to my opinion” (Malebranche 1958-84, 6:95).

Malebranche's description of his own opinion goes beyond what can be found in the original edition of the *Recherche*. However, his description of the other alternatives is drawn directly from this text. In particular, Malebranche had argued there that there are only four alternatives to the conclusion that we see bodies through ideas in God: (1) Bodies transmit resembling species to the soul; (2) Our soul has the power to produce ideas when triggered by non-resembling bodily impression; (3) Ideas are created with the soul or produced in it successively by God; and (4) Our soul sees both the essence and the existence of bodies by considering its own perfections. Malebranche told Arnauld that since this list constitutes “an exact division … of all the ways in which we can see objects” and since each of the alternative accounts yields “manifest contradictions,” his argument from elimination serves to demonstrate the doctrine of the vision in God (Malebranche 1958-84, 6:198f).

It is difficult to determine from the *Recherche* the precise source of the enumeration. However, Connell (1967) has established that Malebranche's argument was drawn from the account of angelic knowledge in

the work of the Spanish scholastic, Francisco Suárez (1548-1617). Particularly crucial for Malebranche's enumeration is Suárez's claim that angels must know material objects through species that God adds to their mind given that God alone can know them through His own substance. In light of this claim, we can take Malebranche's first three hypotheses to cover the various ways in which we could perceive bodies through immaterial species "superadded" to our soul, and his fourth hypothesis to cover the possibility that we perceive bodies in the perfections of our soul. In arguing against the last hypothesis, Malebranche noted that since a finite being can see in itself neither the infinite nor an infinite number of beings (as Suárez had argued in the case of angels), and since we in fact perceive both the infinite and infinity in external objects, it must be that we see these objects by means of perfections contained in the only being that can possess an infinity of ideas, namely, God Himself.

Malebranche took the conclusion here to confirm the view in "an infinity of passages" in Augustine that "we see God" in knowing eternal truths. This appeal to the Augustinian theory of divine illumination provides the basis for an argument for the vision in God that bypasses the unusual enumeration in the *Recherche*. This more direct argument is introduced in "Eclaircissement X," where Malebranche urged that the ideas we perceive must exist in an "immutable and necessary Reason" since they are themselves immutable and necessary (Malebranche 1958-84, 3:129f). Malebranche emphasized that the Augustinian view that eternal truths derive from uncreated features of the divine intellect conflicts directly with the voluntarist conclusion in Descartes that these truths derive rather from God's free and indifferent will. Particularly in his exchanges with Arnauld, Malebranche attempted to present his doctrine of the vision in God as a natural consequence of Descartes' account of ideas. However, his Augustinian argument serves to show that Descartes himself could not have accepted this doctrine. Moreover, such an argument reveals the most fundamental reason for Malebranche's rejection of Arnauld's Cartesian identification of ideas with our own perceptions. Since Malebranche identified these ideas with necessary and immutable essences, and since he held that these ideas derive their necessity and immutability from the divine intellect, he concluded that Arnauld's position can only result in a radical subjectivism that renders impossible any sort of a priori knowledge of the material world.

"Eclaircissement X" also introduces the notion of "intelligibile extension" mentioned in Malebranche's claim to Arnauld quoted above concerning his own opinion. According to this Eclaircissement, God has a single ideal extension that serves to represent particular bodies to Him. Arnauld objected that this position involves a retraction of the claim in the *Recherche* that we perceive bodies by means of distinct ideas in God. In response, Malebranche insisted that his view all along was that God represents particular bodies by means of His own simple "absolute being." For Arnauld, however, the view that God contains extension in this way is objectionable since it is connected to the heretical view in the work of the Dutch thinker Benedict Spinoza that God is extended substance. The charge of Spinozism reappears in Malebranche's 1713-14 correspondence with one of his former students, J.J. Dortous de Mairan (1678-1771), who later became the Secretary of the Paris Académie des sciences. As in the case of Arnauld, so in this correspondence Malebranche vigorously denied this charge. In both cases, he responded by emphasizing that the infinite and indivisible ideal extension that exists in God differs from the finite and divisible extension in the material world.

A final feature of Malebranche's doctrine of the vision in God is connected to the notion in his writings

of the “efficacious idea” (*idée efficace*). As first noted in Robinet (1965), this notion became entrenched in Malebranche's system around 1695, after his encounter with his Cartesian critic Régis. In his *Systême de philosophie,* Régis had challenged the claim in the preface to the *Recherche* that our mind is united to God in a manner that “raises the mind above all things” and is the source of “its life, its light, and its entire felicity” (Malebranche 1958-84, 1:9). While he granted the commonplace claim that God must create and conserve our soul, Régis denied that we are enlightened by means of a union with ideas of bodies in God. Rather, he insisted that God conserves in us ideas that derive directly from the bodies they represent. In the 1693 *Réponse à Régis* (*Response to Régis*), Malebranche emphasized his Augustinian position that we can be instructed as to the nature of bodies only through a union with God. However, he put a new spin on this position when he noted that the union with God involves an “affecting” or “touching” of our mind by God's idea of extension.

Already in the 1688 *Entretiens sur la métaphysique* Malebranche had suggested that the union with God can be explicated in terms of a causal relation between God's ideas and our mind. After 1695, he developed this suggestion by introducing the notion of “pure” or non-sensory intellectual perceptions that are produced by God's efficacious idea of extension. Yet he also stressed in this later period that such an idea is the causal source of our sensations. One advantage of this extension of the doctrine of efficacious ideas to sensations is that it yields a fairly clear explanation of Malebranche's claim to Arnauld that an idea is “intelligible extension rendered sensible by color or light.” Prior to 1695, Malebranche explained how intelligible extension is so rendered by appealing somewhat obscurely to the fact that the soul “attaches” colors to a non-sensory idea. However, the theory of efficacious ideas allowed him to say that this idea is rendered sensible by causing in us the appropriate sensations of color and light. The claim that we see ideas in God is thus transformed into the claim that our soul has intellectual and sensory perceptions that yield an understanding of the truth concerning bodies in virtue of their causal relation to God's idea of extension. Drawing on Robinet's results, one scholar has concluded that while Malebranche started with the vision *in* God, he ended with a vision *by* God (Alquié 1974, 209).

3. Cartesian Dualism

Malebranche told Arnauld that it was Augustine's authority “which has given me the desire to put forth *the new philosophy of ideas*” (Malebranche 1958-84, 6:80). By contrast, he emphasized in the preface of the *Recherche* that Augustine had failed to see that sensible qualities “are not clearly contained in the idea we have of matter,” adding that “the difference between mind and body has been known with sufficient clarity for only a few years” (Malebranche 1958-84, 1:20). The allusion here is to Descartes's recent discovery of an idea of matter that reveals that its nature consists in extension alone. This idea dictates that sensible qualities such as colors, tastes and odors that are not reducible to modes of extension cannot exist external to mind. But since these qualities exist in the mind, and in particular in the mind's perception of the qualities, the mind itself must be distinguished from body. In this way the Cartesian idea of matter reveals “the difference between mind and body.”

In the initial book of the *Recherche,* on the senses, Malebranche proposed that the erroneous belief in the Aristotelians as well as in Augustine that sensible qualities exist in bodies has its source in a misuse of

"natural judgments" that help in the conservation of the human body. Here he was following Descartes' account in "Meditation VI" of the "teachings of nature," and in particular the claim there that the purpose of sensations is not to teach us about the nature of bodies but simply to inform us of what is beneficial or harmful to the human composite. Just as Descartes had urged that erroneous beliefs about the nature of body can be avoided by attending to the clear and distinct perceptions of the intellect, so Malebranche counseled that we avoid error by attending to what the clear idea of matter reveals to us about the nature of body. As we have seen, Malebranche had Augustinian reasons for saying that the idea that so instructs us exists in God. By his own admission, however, the conclusion that the idea that instructs us is an idea of *extension* derives from the recent discoveries of Descartes.

Malebranche emphasized that the clear idea of extension must be distinguished from our confused sensations. One point he wanted to make is that the idea exists in God while the sensations are only modifications of our mind. However, his emphasis on the fact that this idea is "pure" or non-sensory indicates that our experience of the material world has an intellectual component. We have seen that his late doctrine of the efficacious idea involved the position that we have pure intellectual perceptions produced by God's intellectual idea of extension. But his mature position that this idea is also the cause of our sensations allows for the claim that our most basic sensory contact with the material world has an intellectual component.

We know that Malebranche's doctrine of the vision in God conflicts with Descartes' doctrine of the creation of the eternal truths. However, there are further departures from orthodox Cartesianism that are linked to two qualifications of this doctrine. The first qualification is that God's idea of extension can reveal only the nature of bodies and not their existence. This qualification is not explicit in the initial edition of the *Recherche*, which says only that the existence of properties of bodies external to us is "very difficult to prove" (Malebranche 1958-84, 1:122). Foucher had objected that Malebranche has no good reason to affirm that the external existence of these properties. In "Eclaircissement VI," Malebranche urged that the idea of extension does reveal the possible existence of the material world, and that Descartes has shown that we have a probable argument for its actual existence deriving from our natural propensity to believe that there are bodies. However, he conceded in this text—without crediting Foucher—that neither he nor Descartes can provide an argument from reason that demonstrates "with evidence" or "with geometric rigor" that this belief is true. His conclusion is that such an argument must appeal to faith in the veracity of the report in the Scriptures that God has created the heavens and the earth.

According to the second qualification of the vision in God—which is found in the original edition of the *Recherche*—we perceive the nature of our soul not through a clear idea in God, but only through a confused "consciousness or inner sensation" (*conscience ou sentiment intérieur*). Malebranche accepted the Cartesian commonplace that consciousness reveals immediately the existence of the soul. He allowed that we know the nature of our soul to consist in thought, moreover, and he embraced the Cartesian conclusion that the soul as a thinking thing is distinct from body as an extended thing. Yet he insisted that we know that the soul is distinct from the body not by means of any direct insight into the nature of thought, but rather by seeing that thought is not contained in the idea of matter. More generally, Malebranche claimed that our lack of access to a clear idea of the soul is evident from the fact that we do

not have knowledge of thought that matches our knowledge of the mathematical features of bodies. This last point turns on its head Descartes' own conclusion in “Meditation II” that the nature of the human mind is “better known” than the nature of body; for Malebranche, it is the nature of body that is better known than the nature of mind.

In “Eclaircissement XI,” Malebranche attempted to counter “the authority of Descartes” by arguing that the Cartesians themselves must admit that they have only a confused awareness of the nature of the sensory modifications of the soul. He noted that while the intellectual idea allows the various modes of extension to be related in a precise manner, there is no clear scale on which we can order our sensations of different shades of the same color, not to mention our sensations of sensible qualities of different kinds. Malebranche took the confusion in the sensations to reveal a confusion in our perception of the nature of the soul. He added that Cartesians can discern that sensible qualities are modifications of an immaterial soul only by seeing that they are “not clearly contained in the idea we have of matter.”

4. Occasionalism

Malebranche is known for his occasionalism, that is, his doctrine that God is the only causal agent, and that creatures merely provide the “occasion” for divine action. On the old textbook account, occasionalism was an *ad hoc* response to the purported problem in Descartes of how substances as distinct in nature as mind and body are can causally interact. According to this account, Malebranche was driven by this problem with Cartesian dualism to propose that it is God who brings it about that our sensations and volitions are correlated with motions in our body.

However, occasionalism was already an old doctrine at the time that Thomas Aquinas (1225-1274) wrote against it. Thomas indicated that the primary concern of the occasionalists was to strengthen the assertion of God's omnipotence. Though he allowed that God must “concur” with creatures in producing effects, Thomas also claimed that there is reason to conclude that creatures are true secondary causes. For instance, he urged that it is more in accord with divine greatness to say that God communicates His power to creatures. Moreover, he claimed that it is simply evident to the senses that creatures have the power to bring about effects. Thomas also argued that if there were no natures in creatures that explain effects, there could be no true scientific explanation of effects through their natural causes.

Malebranche was concerned to respond to all of these arguments against occasionalism, particularly as they were developed in the work of scholastics such as Suárez. Against the first point that God's greatness requires the communication of His power, he countered that it is in fact idolatrous to attribute divine power to creatures. Malebranche's argument that God alone can produce effects relies on the assumption that “a true cause … is one such that the mind perceives a necessary connection [*liaison nécessaire*] between it and its effects” (Malebranche 1958-84, 2:316). He claimed that there is such a connection neither among bodily states, nor between bodily and mental states, nor among mental states. In all of these cases, one can deny the connections without contradiction. There can be a necessary causal connection in only one case, namely, the connection between the volitions of an omnipotent agent and its upshots. Thus, only such an agent, namely, God, can be a true cause.

In the *Entretiens sur la métaphysique*, Malebranche offered a different argument based on Descartes's suggestion in "Meditation III" that God conserves the world by continuously creating it. The argument begins with the claim that God must create bodies in some particular place and in determinate relations of distance to other bodies. If God conserves a body by creating it in the same place from moment to moment, that body remains at rest, and if he conserves it by creating it in different places from moment to moment, it is in motion. We cannot even create motion in our own bodies. Rather, it is God who must produce it on the occasion of volitional states. Moreover, it is not motions in our brain that cause our sensory states, but God who produces them on the occasion of the presence of such motions. Finally, I have indicated the view in the *Entretiens* that God produces our intellectual states through the union of our mind with His "intelligible extension." While the argument from the necessity of the causal connection yields the result that only an omnipotent being can be a cause, the argument here is that only that being which creates/conserves the world can cause various bodily and mental states. However, both arguments converge on the conclusion, which Malebranche claimed to find in Augustine, that all creatures depend entirely on God.

The second scholastic argument against occasionalism appealed to the purported fact that it is evident to the senses that creatures have causal power. For Malebranche, however, this argument is no more persuasive than the argument that bodies must have colors and tastes since our senses tell us that they do. As indicated above, Malebranche offered Cartesian grounds for thinking that the purpose of our sensations is not to reveal the true nature of the material world, but rather to indicate what is helpful or harmful to our body. Malebranche held that our attribution of causal powers to bodies manifests in particular an attachment to the body that is an effect of original sin. Due to this attachment, we take objects in the material world to be a cause of our happiness rather than God.

In "Eclaircissement XV," Malebranche responded to the scholastic point that occasionalism renders scientific explanation impossible by appealing to the fact that God is not an arbitrary agent, but acts in accord with His wisdom. This wisdom dictates that He act "almost always" by means of a "general and efficacious will." Such a will produces effects that are perfectly law-like. For instance, God acts by a general will in producing changes in bodies in accord with the law of the communication of motion. Malebranche did allow that God can produce miracles by "particular volitions" that are not law-like. However, he emphasized that there are relatively few such volitions in God. Thus, we can offer scientific explanations that appeal to the laws of motion that reflect the nature of God's general will.

Malebranche was not the first Cartesian to endorse occasionalism. There were followers of Descartes such as Louis de la Forge (1632-1666) and Claude Clerselier (1614-1684) who stressed that God must be the cause of the communication of motion in bodily collisions given the passivity of Cartesian matter. These Cartesians attempted to preserve some room for the action of finite minds on body, but the Cartesian Geraud de Cordemoy (1626-1684) went further in claiming that only God can cause changes in the material world. However, none of these thinkers went as far as Malebranche in asserting that God must produce all real changes in nature. Moreover, Malebranche is distinctive in providing an explanation of God's action that distinguishes His general will from His particular volitions.

5. Theodicy

The presence of various evils in the world is problematic for anyone who claims that this world was created by a God who has infinite power, knowledge and goodness. However, the problem is particularly acute for an occasionalist such as Malebranche who holds that God is the only true cause of effects in nature. Malebranche offered a theodicy that addresses the problem of evil by emphasizing that in the "order of nature" God acts for the most part through His general will. In *Nature et grâce*, he started by admitting that God could have acted by particular volitions to prevent natural evils such as malformed offspring (a fitting example given his own malformed spine), and thus could have produced a more perfect world than He actually did create. However, he urged that God could have done so only by departing from simple laws, thereby sacrificing the simplicity and uniformity of action that is a supreme mark of His wisdom. God produces the natural evils that follow from simple laws not because He wills those particular effects, but because He wills a world that best reflects His wisdom by possessing the most effects governed by the fewest laws.

In his *Réflexions* on Malebranche's *Nature et grâce,* Arnauld objected to what he took to be the suggestion in his target text that God has concern only for general features of the world and does not will the details of His effects. For Arnauld, divine providence requires that God intend all of the particularities of the world He creates. There is some controversy over whether Arnauld's critique is based on a proper interpretation of Malebranche. Certain commentators follow Arnauld in thinking that Malebranche's claim in *Nature et grâce* that God acts by relatively few general volitions involves a rejection of the position that He has volitions for each particular effect. Others have insisted that this claim says only that God has volitions in accord with general laws, and that the doctrine of God's continual creation in the *Entretiens* in fact requires distinct volitions for distinct effects. Some evidence for the former view is provided by the fact that Malebranche emphasized that the laws themselves are "efficacious," and that God employs relatively few volitions in producing effects in the order of nature.

Malebranche insisted that God's general will is operative not only in the order of nature, but also in the "order of grace." However, he noted that the production of effects in the latter order also involves human action that is free in the strong sense of not being determined by anything external to the agent. His appeal to this sort of freedom is in fact central to his solution to the problem of moral evil, that is, the compatibility of sin with God's goodness. According to Malebranche, God is not responsible for sinful action since such action derives not from Him but from sinful agents. Arnauld objected that this solution is "more pelagian than anything in Pelagius," and that one must side with Augustine, who declared Pelagianism a heresy. Malebranche responded that he did not follow Pelagius in denying the importance of grace, and that Augustine himself had emphasized our freedom in action.

Malebranche also held that it is obvious by "inner sensation" that we are genuinely free. However, there is some question whether this introspective report is compatible with Malebranche's occasionalist claim that God is the only real cause. Malebranche did hold that God alone is the cause of our inclination to love "the good in general." However, he insisted that we are free to "consent" to the stopping of that inclination at a particular object other than God. Such consent results in an "absolute and intrinsic" love

of that object that is sinful given that this love is worthy only of God. The consent is free because one is always able to suspend consent and to search for objects more worthy of our love. Malebranche claimed that our freedom to consent or suspend consent does not conflict with occasionalism since these acts produce no “real” or “physical” change in our minds. The real question for Malebranche is whether it is intelligible to say that we can act freely without bringing about some real change in ourselves.

6. Moral Theory

The theocentrism that is evident in Malebranche's doctrines of the vision in God and occasionalism would lead us to expect that God plays a central role in his moral theory. This expectation is borne out by his discussion in the *Traité de morale*. Indeed, Malebranche's two doctrines are present in that work. The vision in God is reflected in the insistence there that moral duties are dictated by “relations of perfection” revealed in God's wisdom. As in the case of necessary truths concerning body, so in the case of moral truths Malebranche unequivocally rejected Cartesian voluntarism. The doctrine of occasionalism is reflected in Malebranche's insistence that God is our greatest good since He alone can cause our happiness. This point indicates that Malebranche took moral action to require a consideration not only of abstract relations of perfection, but also the happiness of the self.

Malebranche starts from the Augustinian position that morality concerns the proper ordering of our love. Given the importance of human freedom for his theodicy, it is not surprising that Malebranche insisted that the love required for moral action involve the free exercise of the will. His version of the “good will” is one that freely strives to be guided in action by objective relations of perfection that hold among the various objects of love. God is the most perfect being, and hence the most worthy of our love, while human beings are more perfect than mere material beings, and thus more worthy of our love. When the intensity of our love matches the order among perfections, we have a right love that provides the basis for virtue, that is, a habitual inclination to love objects according to their perfections.

Malebranche held that due to original sin, we are inclined not to right love directed by our perception of relations of perfection in God's wisdom, but rather to a disordered love directed by bodily pleasures deriving from the soul-body union. This is the counterpart to the disordered inclination of our will to make judgments about the nature of the material world that are based on sensations deriving from the union. For Malebranche, a corrective to both of these disorders of the will is to attend to clear ideas that exist in God.

Malebranche sometimes suggested that disordered love of bodily pleasure derives from self-love. Encouraged by this suggestion, one of his followers, François Lamy, claimed that his position leads to the quietist view in Fénélon that moral conduct requires a “pure love of God” that involves no concern for the self or its pleasure. This position, which Lamy himself endorsed, was later condemned by the Catholic Church, due in large part to a campaign against Fénélon directed by his critic, Bossuet. But Malebranche insisted that such a position directly conflicts with his own view that pleasure itself is a good that is required as a motive for action. When critics such as Arnauld and Régis charged that this view results in hedonism, Malebranche responded that it is only ordered pleasures that bring the greatest

good. This response is reflected in his claim to Lamy that a disordered love of self is to be contrasted not with pure love of God, but rather with an ordered love that seeks happiness in the contemplation of the greatest good, God. In emphasizing the need for this sort of love of God, Malebranche was returning to his view in the preface to the *Recherche* that it is through a union with God that the mind "receives its life, its light, and its entire felicity."

Baruch Spinoza

Baruch (or Benedictus) Spinoza is one of the most important philosophers -- and certainly the most radical -- of the early modern period. His thought combines a commitment to Cartesian metaphysical and epistemological principles with elements from ancient Stoicism and medieval Jewish rationalism into a nonetheless highly original system. His extremely naturalistic views on God, the world, the human being and knowledge serve to ground a moral philosophy centered on the control of the passions leading to virtue and happiness. They also lay the foundations for a strongly democratic political thought and a deep critique of the pretensions of Scripture and sectarian religion. Of all the philosophers of the seventeenth-century, perhaps none have more relevance today than Spinoza.

1. Biography

Baruch Spinoza was born in 1632 in Amsterdam. He was the middle son in a prominent family of moderate means in Amsterdam's Portuguese-Jewish community. As a boy, he had undoubtedly been one of the star pupils in the congregation's Talmud Torah school. He was intellectually gifted, and this could not have gone unremarked by the congregation's rabbis. It is possible that Spinoza, as he made progress through his studies, was being groomed for a career as a rabbi. But he never made it into the upper levels

of the curriculum, those which included advanced study of Talmud. At the age of seventeen, he was forced to cut short his formal studies to help run the family's importing business.

And then, on July 27, 1656, Spinoza was issued the harshest writ of *cherem*, or excommunication, ever pronounced by the Sephardic community of Amsterdam; it was never rescinded. We do not know for certain what Spinoza's "monstrous deeds" and "abominable heresies" were alleged to have been, but an educated guess comes quite easy. No doubt he was giving utterance to just those ideas that would soon appear in his philosophical treatises. In those works, Spinoza denies the immortality of the soul; strongly rejects the notion of a providential God -- the God of Abraham, Isaac and Jacob; and claims that the Law was neither literally given by God nor any longer binding on Jews. Can there be any mystery as to why one of history's boldest and most radical thinkers was sanctioned by an orthodox Jewish community?

To all appearances, Spinoza was content finally to have an excuse for departing from the community and leaving Judaism behind; his faith and religious commitment were, by this point, gone. Within a few years, he left Amsterdam altogether. By the time his extant correspondence begins, in 1661, he is living in Rijnsburg, not far from Leiden. While in Rijnsburg, he worked on the *Treatise on the Emendation of the Intellect*, an essay on philosophical method, and the *Short Treatise on God, Man and His Well-Being*, an initial but aborted effort to lay out his metaphysical, epistemological and moral views. His critical exposition of Descartes's *Principles of Philosophy*, the only work he published under his own name in his lifetime, was completed in 1663, after he had moved to Voorburg, outside The Hague. By this time, he was also working on what would eventually be called the *Ethics*, his philosophical masterpiece. However, when he saw the principles of toleration in Holland being threatened by reactionary forces, he put it aside to complete his "scandalous" *Theological-Political Treatise*, published anonymously and to great alarm in 1670. When Spinoza died in 1677, in The Hague, he was still at work on his *Political Treatise*; this was soon published by his friends along with his other unpublished writings, including a *Compendium to Hebrew Grammar*.

2. *Ethics*

The *Ethics* is an ambitious and multifaceted work. It is also bold to the point of audacity, as one would expect of a systematic and unforgiving critique of the traditional philosophical conceptions of God, the human being and the universe, and, above all, of the religions and the theological and moral beliefs grounded thereupon. What Spinoza intends to demonstrate (in the strongest sense of that word) is the truth about God, nature and especially ourselves; and the highest principles of society, religion and the good life. Despite the great deal of metaphysics, physics, anthropology and psychology that take up Parts One through Three, Spinoza took the crucial message of the work to be ethical in nature. It consists in showing that our happiness and well-being lie not in a life enslaved to the passions and to the transitory goods we ordinarily pursue; nor in the related unreflective attachment to the superstitions that pass as religion, but rather in the life of reason. To clarify and support these broadly ethical conclusions, however, Spinoza must first demystify the universe and show it for what it really is. This requires laying out some metaphysical foundations, the project of Part One.

God or Nature

"On God" begins with some deceptively simple definitions of terms that would be familiar to any seventeenth century philosopher. "By substance I understand what is in itself and is conceived through itself"; "By attribute I understand what the intellect perceives of a substance, as constituting its essence"; "By God I understand a being absolutely infinite, i.e., a substance consisting of an infinity of attributes, of which each one expresses an eternal and infinite essence." The definitions of Part One are, in effect, simply clear concepts that ground the rest of his system. They are followed by a number of axioms that, he assumes, will be regarded as obvious and unproblematic by the philosophically informed ("Whatever is, is either in itself or in another"; "From a given determinate cause the effect follows necessarily"). From these, the first proposition necessarily follows, and every subsequent proposition can be demonstrated using only what precedes it. (References to the *Ethics* will be by part (I-V), proposition (p), definition (d), scholium (s) and corollary (c).)

In propositions one through fifteen of Part One, Spinoza presents the basic elements of his picture of God. God is the infinite, necessarily existing (that is, uncaused), unique substance of the universe. There is only one substance in the universe; it is God; and everything else that is, is in God.

> Proposition 1: A substance is prior in nature to its affections.
>
> Proposition 2: Two substances having different attributes have nothing in common with one another. (In other words, if two substances differ in nature, then they have nothing in common).
>
> Proposition 3: If things have nothing in common with one another, one of them cannot be the cause of the other.
>
> Proposition 4: Two or more distinct things are distinguished from one another, either by a difference in the attributes [i.e., the natures or essences] of the substances or by a difference in their affections [i.e., their accidental properties].
>
> Proposition 5: In nature, there cannot be two or more substances of the same nature or attribute.
>
> Proposition 6: One substance cannot be produced by another substance.
>
> Proposition 7: It pertains to the nature of a substance to exist.
>
> Proposition 8: Every substance is necessarily infinite.
>
> Proposition 9: The more reality or being each thing has, the more attributes belong to it.

> Proposition 10: Each attribute of a substance must be conceived through itself.
>
> Proposition 11: God, or a substance consisting of infinite attributes, each of which expresses eternal and infinite essence, necessarily exists. (The proof of this proposition consists simply in the classic "ontological proof for God's existence". Spinoza writes that "if you deny this, conceive, if you can, that God does not exist. Therefore, by axiom 7 [‘If a thing can be conceived as not existing, its essence does not involve existence’], his essence does not involve existence. But this, by proposition 7, is absurd. Therefore, God necessarily exists, q.e.d.")
>
> Proposition 12: No attribute of a substance can be truly conceived from which it follows that the substance can be divided.
>
> Proposition 13: A substance which is absolutely infinite is indivisible.
>
> Proposition 14: Except God, no substance can be or be conceived.

This proof that God -- an infinite, necessary and uncaused, indivisible being -- is the only substance of the universe proceeds in three simple steps. First, establish that no two substances can share an attribute or essence (Ip5). Then, prove that there is a substance with infinite attributes (i.e., God) (Ip11). It follows, in conclusion, that the existence of that infinite substance precludes the existence of any other substance. For if there *were* to be a second substance, it would have to have *some* attribute or essence. But since God has *all* possible attributes, then the attribute to be possessed by this second substance would be one of the attributes already possessed by God. But it has already been established that no two substances can have the same attribute. Therefore, there can be, besides God, no such second substance.

If God is the only substance, and (by axiom 1) whatever is, is either a substance or *in* a substance, then everything else must be in God. "Whatever is, is in God, and nothing can be or be conceived without God" (Ip15).

As soon as this preliminary conclusion has been established, Spinoza immediately reveals the objective of his attack. His definition of God -- condemned since his excommunication from the Jewish community as a "God existing in only a philosophical sense" -- is meant to preclude any anthropomorphizing of the divine being. In the scholium to proposition fifteen, he writes against "those who feign a God, like man, consisting of a body and a mind, and subject to passions. But how far they wander from the true knowledge of God, is sufficiently established by what has already been demonstrated." Besides being false, such an anthropomorphic conception of God can have only deleterious effects on human freedom and activity.

Much of the technical language of Part One is, to all appearances, right out of Descartes. But even the most devoted Cartesian would have had a hard time understanding the full import of propositions one through fifteen. What does it mean to say that God is substance and that everything else is "in" God? Is

Spinoza saying that rocks, tables, chairs, birds, mountains, rivers and human beings are all *properties* of God, and hence can be predicated of God (just as one would say that the table "is red")? It seems very odd to think that objects and individuals -- what we ordinarily think of as independent "things" -- are, in fact, merely properties of a thing. Spinoza was sensitive to the strangeness of this kind of talk, not to mention the philosophical problems to which it gives rise. When a person feels pain, does it follow that the pain is ultimately just a *property* of God, and thus that God feels pain? Conundrums such as this may explain why, as of Proposition Sixteen, there is a subtle but important shift in Spinoza's language. God is now described not so much as the underlying substance of all things, but as the universal, immanent and sustaining cause of all that exists: "From the necessity of the divine nature there must follow infinitely many things in infinitely many modes, (i.e., everything that can fall under an infinite intellect)".

According to the traditional Judeo-Christian conception of divinity, God is a transcendent creator, a being who causes a world distinct from himself to come into being by creating it out of nothing. God produces that world by a spontaneous act of free will, and could just as easily have not created anything outside himself. By contrast, Spinoza's God is the cause of all things because all things follow causally and necessarily from the divine nature. Or, as he puts it, from God's infinite power or nature "all things have necessarily flowed, or always followed, by the same necessity and in the same way as from the nature of a triangle it follows, from eternity and to eternity, that its three angles are equal to two right angles" (Ip17s1). The existence of the world is, thus, mathematically necessary. It is impossible that God should exist but not the world. This does not mean that God does not cause the world to come into being freely, since nothing *outside* of God constrains him to bring it into existence. But Spinoza does deny that God creates the world by some arbitrary and undetermined act of free will. God could not have done otherwise. There are no possible alternatives to the actual world, and absolutely no contingency or spontaneity within that world. Everything is absolutely and necessarily determined.

> (Ip29): In nature there is nothing contingent, but all things have been determined from the necessity of the divine nature to exist and produce an effect in a certain way.
>
> (Ip33): Things could have been produced by God in no other way, and in no other order than they have been produced.

There are, however, differences in the way things depend on God. Some features of the universe follow necessarily from God -- or, more precisely, from the absolute nature of one of God's attributes -- in a direct and unmediated manner. These are the universal and eternal aspects of the world, and they do not come into or go out of being. They include the most general laws of the universe, together governing all things in all ways. From the attribute of extension there follow the principles governing all extended objects (the truths of geometry) and laws governing the motion and rest of bodies (the laws of physics); from the attribute of thought, there follow laws of thought (understood by commentators to be either the laws of logic or the laws of psychology). Particular and individual things are causally more remote from God. They are nothing but "affections of God's attributes, or modes by which God's attributes are expressed in a certain and determinate way" (Ip25c).

There are two causal orders or dimensions governing the production and actions of particular things. On

the one hand, they are determined by the general laws of the universe that follow immediately from God's natures. On the other hand, each particular thing is determined to act and to be acted upon by other particular things. Thus, the actual behavior of a body in motion is a function not just of the universal laws of motion, but also of the other bodies in motion and rest surrounding it and with which it comes into contact.

Spinoza's metaphysics of God is neatly summed up in a phrase that occurs in the Latin (but not the Dutch) edition of the *Ethics*: "God, or Nature", *Deus, sive Natura*: "That eternal and infinite being we call God, or Nature, acts from the same necessity from which he exists" (Part IV, Preface). It is an ambiguous phrase, since Spinoza could be read as trying either to divinize nature or to naturalize God. But for the careful reader there is no mistaking Spinoza's intention. The friends who, after his death, published his writings must have left out the "or Nature" clause from the more widely accessible Dutch version out of fear of the reaction that this identification would, predictably, arouse among a vernacular audience.

There are, Spinoza insists, two sides of Nature. First, there is the active, productive aspect of the universe -- God and his attributes, from which all else follows. This is what Spinoza, employing the same terms he used in the *Short Treatise*, calls *Natura naturans*, "naturing Nature". Strictly speaking, this is identical with God. The other aspect of the universe is that which is produced and sustained by the active aspect, *Natura naturata*, "natured Nature".

> By *Natura naturata* I understand whatever follows from the necessity of God's nature, or from any of God's attributes, i.e., all the modes of God's attributes insofar as they are considered as things that are in God, and can neither be nor be conceived without God. (Ip29s).

Spinoza's fundamental insight in Book One is that Nature is an indivisible, uncaused, substantial whole -- in fact, it is the *only* substantial whole. Outside of Nature, there is nothing, and everything that exists is a part of Nature and is brought into being by Nature with a deterministic necessity. This unified, unique, productive, necessary being just *is* what is meant by ‘God’. Because of the necessity inherent in Nature, there is no teleology in the universe. Nature does not act for any ends, and things do not exist for any set purposes. There are no "final causes" (to use the common Aristotelian phrase). God does not "do" things for the sake of anything else. The order of things just follows from God's essences with an inviolable determinism. All talk of God's purposes, intentions, goals, preferences or aims is just an anthropomorphizing fiction.

> All the prejudices I here undertake to expose depend on this one: that men commonly suppose that all natural things act, as men do, on account of an end; indeed, they maintain as certain that God himself directs all things to some certain end, for they say that God has made all things for man, and man that he might worship God. (I, Appendix)

God is not some goal-oriented planner who then judges things by how well they conform to his purposes. Things happen only because of Nature and its laws. "Nature has no end set before it . . . All things proceed by a certain eternal necessity of nature." To believe otherwise is to fall prey to the same

superstitions that lie at the heart of the organized religions.

> [People] find -- both in themselves and outside themselves -- many means that are very helpful in seeking their own advantage, e.g., eyes for seeing, teeth for chewing, plants and animals for food, the sun for light, the sea for supporting fish . . . Hence, they consider all natural things as means to their own advantage. And knowing that they had found these means, not provided them for themselves, they had reason to believe that there was someone else who had prepared those means for their use. For after they considered things as means, they could not believe that the things had made themselves; but from the means they were accustomed to prepare for themselves, they had to infer that there was a ruler, or a number of rulers of nature, endowed with human freedom, who had taken care of all things for them, and made all things for their use.
>
> And since they had never heard anything about the temperament of these rulers, they had to judge it from their own. Hence, they maintained that the Gods direct all things for the use of men in order to bind men to them and be held by men in the highest honor. So it has happened that each of them has thought up from his own temperament different ways of worshipping God, so that God might love them above all the rest, and direct the whole of Nature according to the needs of their blind desire and insatiable greed. Thus this prejudice was changed into superstition, and struck deep roots in their minds. (I, Appendix)

A judging God who has plans and acts purposively is a God to be obeyed and placated. Opportunistic preachers are then able to play on our hopes and fears in the face of such a God. They prescribe ways of acting that are calculated to avoid being punished by that God and earn his rewards. But, Spinoza insists, to see God or Nature as acting for the sake of ends -- to find purpose in Nature -- is to misconstrue Nature and "turn it upside down" by putting the effect (the end result) before the true cause.

Nor does God perform miracles, since there are no departures whatsoever from the necessary course of nature. The belief in miracles is due only to ignorance of the true causes of phenomena.

> If a stone has fallen from a room onto someone's head and killed him, they will show, in the following way, that the stone fell in order to kill the man. For if it did not fall to that end, God willing it, how could so many circumstances have concurred by chance (for often many circumstances do concur at once)? Perhaps you will answer that it happened because the wind was blowing hard and the man was walking that way. But they will persist: why was the wind blowing hard at that time? why was the man walking that way at that time? If you answer again that the wind arose then because on the preceding day, while the weather was still calm, the sea began to toss, and that the man had been invited by a friend, they will press on -- for there is no end to the questions which can be asked: but why was the sea tossing? why was the man invited at just that time? And so they will not stop asking for the causes of causes until you take refuge in the will of God, i.e., the sanctuary of ignorance. (I, Appendix)

This is strong language, and Spinoza is clearly not unaware of the risks of his position. The same preachers who take advantage of our credulity will fulminate against anyone who tries to pull aside the curtain and reveal the truths of Nature. "One who seeks the true causes of miracles, and is eager, like an educated man, to understand natural things, not to wonder at them, like a fool, is generally considered and denounced as an impious heretic by whose whom the people honor as interpreters of nature and the Gods. For they know that if ignorance is taken away, then foolish wonder, the only means they have of arguing and defending their authority is also taken away."

The Human Being

In Part Two, Spinoza turns to the origin and nature of the human being. The two attributes of God of which we have cognizance are extension and thought. This, in itself, involves what would have been an astounding thesis in the eyes of his contemporaries, one that was usually misunderstood and always vilified. When Spinoza claims in Proposition Two that "Extension is an attribute of God, or God is an extended thing", he was almost universally -- but erroneously -- interpreted as saying that God is literally corporeal. For just this reason, "Spinozism" became, for his critics, synonymous with atheistic materialism.

According to one interpretation, God is indeed material, even matter itself, but this does not imply that God has a body. Another interpretation, however, one which will be adopted here, is that what is in God is not matter per se, but extension as an essence. And extension and thought are two distinct essences that have absolutely nothing in common. The modes or expressions of extension are physical bodies; the modes of thought are ideas. Because extension and thought have nothing in common, the two realms of matter and mind are causally closed systems. Everything that is extended follows from the attribute of extension alone. Every bodily event is part of an infinite causal series of bodily events and is determined only by the nature of extension and its laws, in conjunction with its relations to other extended bodies. Similarly, every idea follows only from the attribute of thought. Any idea is an integral part of an infinite series of ideas and is determined by the nature of thought and its laws, along with its relations to other ideas. There is, in other words, no causal interaction between bodies and ideas, between the physical and the mental. There is, however, a thoroughgoing correlation and parallelism between the two series. For every mode in extension that is a relatively stable collection of matter, there is a corresponding mode in thought. In fact, he insists, "a mode of extension and the idea of that mode are one and the same thing, but expressed in two ways". Because of the fundamental and underlying unity of Nature, or of Substance, Thought and Extension are just two different ways of "comprehending" one and the same Nature. Every material thing thus has its own particular idea -- a kind of Platonic concept -- that expresses or represents it. Since that idea is just a mode of one of God's attributes -- Thought -- it is in God, and the infinite series of ideas constitutes God's mind. As he explains,

> A circle existing in nature and the idea of the existing circle, which is also in God, are one and the same thing, which is explained through different attributes. Therefore, whether we conceive nature under the attribute of Extension, or under the attribute of Thought, or under any other attribute, we shall find one and the same order, or one and the same connection of causes, i.e., that the same things follow one another.

It follows from this, he argues, that the causal relations between bodies is mirrored in the logical relations between God's ideas. Or, as Spinoza notes in Proposition Seven, "the order and connection of ideas is the same as the order and connection of things".

One kind of extended body, however, is significantly more complex than any others in its composition and in its dispositions to act and be acted upon. That complexity is reflected in its corresponding idea. The body in question is the human body; and its corresponding idea is the human mind or soul. The mind, then, like any other idea, is simply one particular mode of God's attribute, Thought. Whatever happens in the body is reflected or expressed in the mind. In this way, the mind perceives, more or less obscurely, what is taking place in its body. And through its body's interactions with other bodies, the mind is aware of what is happening in the physical world around it. But the human mind no more interacts with its body than any mode of Thought interacts with a mode of Extension.

One of the pressing questions in seventeenth century philosophy, and perhaps the most celebrated legacy of Descartes's dualism, is the problem of how two radically different substances such as mind and body enter into a union in a human being and cause effects in each other. How can the extended body causally engage the unextended mind, which is incapable of contact or motion, and "move" it, that is, cause mental effects such as pains, sensations and perceptions. Spinoza, in effect, denies that the human being is a union of two *substances*. The human mind and the human body are two different expressions -- under Thought and under Extension -- of one and the same thing: the person. And because there is no causal interaction between the mind and the body, the so-called mind-body problem does not, technically speaking, arise.

Knowledge

The human mind, like God, contains ideas. Some of these ideas -- sensory images, qualitative "feels" (like pains and pleasures), perceptual data -- are imprecise qualitative phenomena, being the expression in thought of states of the body as it is affected by the bodies surrounding it. Such ideas do not convey adequate and true knowledge of the world, but only a relative, partial and subjective picture of how things presently seem to be to the perceiver. There is no systematic order to these perceptions, nor any critical oversight by reason. "As long as the human Mind perceives things from the common order of nature, it does not have an adequate, but only a confused and mutilated knowledge of itself, of its own Body, and of external bodies" (Iip29c). Under such circumstances, we are simply determined in our ideas by our fortuitous and haphazard encounter with things in the external world. This superficial acquaintance will never provide us with knowledge of the essences of those things. In fact, it is an invariable source of falsehood and error. This "knowledge from random experience" is also the origin of great delusions, since we -- thinking ourselves free -- are, in our ignorance, unaware of just how we *are* determined by causes.

Adequate ideas, on the other hand, are formed in a rational and orderly manner, and are necessarily true and revelatory of the essences of things. "Reason", the second kind of knowledge (after "random experience"), is the apprehension of the essence of a thing through a discursive, inferential procedure. "A

true idea means nothing other than knowing a thing perfectly, or in the best way." It involves grasping a thing's causal connections not just to other objects but, more importantly, to the attributes of God and the infinite modes (the laws of nature) that follow immediately from them. The adequate idea of a thing clearly and distinctly situates its object in all of its causal nexuses and shows not just *that* it is, but *how* and *why* it is. The person who truly knows a thing sees the reasons why the thing was determined to be and could not have been otherwise. "It is of the nature of Reason to regard things as necessary, not as contingent" (IIp44). The belief that some thing is accidental or spontaneous can be based only on an inadequate grasp of the thing's causal explanation, on a partial and "mutilated" familiarity with it. To perceive by way of adequate ideas is to perceive the necessity inherent in Nature.

Sense experience alone could never provide the information conveyed by an adequate idea. The senses present things only as they appear from a given perspective at a given moment in time. An adequate idea, on the other hand, by showing how a thing follows necessarily from one or another of God's attributes, presents it in its "eternal" aspects -- *sub specie aeternitatis*, as Spinoza puts it -- without any relation to time. "It is of the nature of Reason to regard things as necessary and not as contingent. And Reason perceives this necessity of things truly, i.e., as it is in itself. But this necessity of things is the very necessity of God's eternal nature. Therefore, it is of the nature of Reason to regard things under this species of eternity". The third kind of knowledge, intuition, takes what is known by Reason and grasps it in a single act of the mind.

Spinoza's conception of adequate knowledge reveals an unrivaled optimism in the cognitive powers of the human being. Not even Descartes believed that we could know all of Nature and its innermost secrets with the degree of depth and certainty that Spinoza thought possible. Most remarkably, because Spinoza thought that the adequate knowledge of any object, and of Nature as a whole, involves a thorough knowledge of God and of how things related to God and his attributes, he also had no scruples about claiming that we can, at least in principle, know God perfectly and adequately. "The knowledge of God's eternal and infinite essence that each idea involves is adequate and perfect" (IIp46). "The human Mind has an adequate knowledge of God's eternal and infinite essence" (Iip47). No other philosopher in history has been willing to make this claim. But, then again, no other philosopher identified God with Nature.

Passion and Action

Spinoza engages in such a detailed analysis of the composition of the human being because it is essential to his goal of showing how the human being is a part of Nature, existing within the same causal nexuses as other extended and mental beings. This has serious ethical implications. First, it implies that a human being is not endowed with freedom, at least in the ordinary sense of that term. Because our minds and the events in our minds are simply ideas that exist within the causal series of ideas that follows from God's attribute Thought, our actions and volitions are as necessarily determined as any other natural events. "In the Mind there is no absolute, or free, will, but the Mind is determined to will this or that by a cause that is also determined by another, and this again by another, and so to infinity."

What is true of the will (and, of course, of our bodies) is true of all the phenomena of our psychological

lives. Spinoza believes that this is something that has not been sufficiently understood by previous thinkers, who seem to have wanted to place the human being on a pedestal outside of (or above) nature.

> Most of those who have written about the Affects, and men's way of living, seem to treat, not of natural things, which follow the common laws of nature, but of things that are outside nature. Indeed they seem to conceive man in nature as a dominion within a dominion. For they believe that man disturbs, rather than follows, the order of nature, that he has absolute power over his actions, and that he is determined only by himself. (III, Preface)

Descartes, for example, believed that if the freedom of the human being is to be preserved, the soul must be exempt from the kind of deterministic laws that rule over the material universe.

Spinoza's aim in Parts Three and Four is, as he says in his Preface to Part Three, to restore the human being and his volitional and emotional life into their proper place in nature. For nothing stands outside of nature, not even the human mind.

> Nature is always the same, and its virtue and power of acting are everywhere one and the same, i.e., the laws and rules of nature, according to which all things happen, and change from one form to another, are always and everywhere the same. So the way of understanding the nature of anything, of whatever kind, must also be the same, viz. through the universal laws and rules of nature.

Our affects -- our love, anger, hate, envy, pride, jealousy, etc. -- "follow from the same necessity and force of nature as the other singular things". Spinoza, therefore, explains these emotions -- as determined in their occurrence as are a body in motion and the properties of a mathematical figure -- just as he would explain any other things in nature. "I shall treat the nature and power of the Affects, and the power of the Mind over them, by the same Method by which, in the preceding parts, I treated God and the Mind, and I shall consider human actions and appetites just as if it were a Question of lines, planes, and bodies."

Our affects are divided into actions and passions. When the cause of an event lies in our own nature -- more particularly, our knowledge or adequate ideas -- then it is a case of the mind acting. On the other hand, when something happens in us the cause of which lies outside of our nature, then we are passive and being acted upon. Usually what takes place, both when we are acting and when we are being acted upon, is some change in our mental or physical capacities, what Spinoza calls "an increase or decrease in our power of acting" or in our "power to persevere in being". All beings are naturally endowed with such a power or striving. This *conatus*, a kind of existential inertia, constitutes the "essence" of any being. "Each thing, as far as it can by its own power, strives to persevere in its being." An affect just *is* any change in this power, for better or for worse. Affects that are actions are changes in this power that have their source (or "adequate cause") in our nature alone; affects that are passions are those changes in this power that originate outside of us.

What we should strive for is to be free from the passions -- or, since this is not absolutely possible, at least

to learn how to moderate and restrain them -- and become active, autonomous beings. If we can acheive this, then we will be "free" to the extent that whatever happens to us will result not from our relations with things outside us, but from our own nature (as that follows from, and is ultimately and necessarily determined by the attributes of God of which our minds and bodies are modes). We will, consequently, be truly liberated from the troublesome emotional ups and downs of this life. The way to bring this about is to increase our knowledge, our store of adequate ideas, and eliminate as far as possible our inadequate ideas, which follow not from the nature of the mind alone but from its being an expresssion of how our body is affected by other bodies. In other words, we need to free ourselves from a reliance on the senses and the imagination, since a life of the senses and images is a life being affected and led by the objects around us, and rely as much as we can only on our rational faculties.

Because of our innate striving to persevere -- which, in the human being, is called "will" or "appetite" -- we naturally pursue those things that we believe will benefit us by increasing our power of acting and shun or flee those things that we believe will harm us by decreasing our power of acting. This provides Spinoza with a foundation for cataloguing the human passions. For the passions are all functions of the ways in which external things affect our powers or capacities. Joy [*Laaetitiae*, sometimes translated as "pleasure"], for example, is simply the movement or passage to a greater capacity for action. "By Joy . . . I shall understand that passion by which the Mind passes to a greater perfection" (IIIp11s). Being a passion, joy is always brought about by some external object. Sadness [*Tristitiae*, or "pain"], on the other hand, is the passage to a lesser state of perfection, also occasioned by a thing outside us. Love is simply Joy accompanied by an awareness of the external cause that brings about the passage to a greater perfection. We love that object that benefits us and causes us joy. Hate is nothing but "Sadness with the accompanying idea of an external cause". Hope is simply "an inconstant Joy which has arisen from the image of a future or past thing whose outcome we doubt". We hope for a thing whose presence, as yet uncertain, will bring about joy. We fear, however, a thing whose presence, equally uncertain, will bring about sadness. When that whose outcome was doubtful becomes certain, hope is changed into confidence, while fear is changed into despair.

All of the human emotions, in so far as they are passions, are constantly directed outward, towards things and their capacities to affect us one way or another. Aroused by our passions and desires, we seek or flee those things that we believe cause joy or sadness. "We strive to further the occurrence of whatever we imagine will lead to Joy, and to avert or destroy what we imagine is contrary to it, or will lead to Sadness." Our hopes and fears fluctuate depending on whether we regard the objects of our desires or aversions as remote, near, necessary, possible or unlikely. But the objects of our passions, being external to us, are completely beyond our control. Thus, the more we allow ourselves to be controlled by *them*, the more we are subject to passions and the less active and free we are. The upshot is a fairly pathetic picture of a life mired in the passions and pursuing and fleeing the changeable and fleeting objects that occasion them: "We are driven about in many ways by external causes, and . . . like waves on the sea, driven by contrary winds, we toss about, not knowing our outcome and fate" (IIIp59s). The title for Part Four of the *Ethics* reveals with perfect clarity Spinoza's evaluation of such a life for a human being: "On Human Bondage, or the Powers of the Affects". He explains that the human being's "lack of power to moderate and restrain the affects I call Bondage. For the man who is subject to affects is under the control, not of himself, but of fortune, in whose power he so greatly is that often, though he sees the better for himself,

he is still forced to follow the worse". It is, he says, a kind of "sickness of the mind" to suffer too much love for a thing "that is liable to many variations and that we can never fully possess."

Virtue and Happiness

The solution to this predicament is an ancient one. Since we cannot control the objects that we tend to value and that we allow to influence our well-being, we ought instead to try to control our evaluations themselves and thereby minimize the sway that external objects and the passions have over us. We can never eliminate the passive affects entirely. We are essentially a part of nature, and can never fully remove outselves from the causal series that link us to external things. But we can, ultimately, counteract the passions, control them, and achieve a certain degree of relief from their turmoil.

The path to restraining and moderating the affects is through virtue. Spinoza is a psychological and ethical egoist. All beings naturally seek their own advantage -- to preserve their own being -- and it is right for them do so. This is what virtue consists in. Since we are thinking beings, endowed with intelligence and reason, what is to our greatest advantage is knowledge. Our virtue, therefore, consists in the pursuit of knowledge and understanding, of adequate ideas. The best kind of knowledge is a purely intellectual intuition of the essences of things. This "third kind of knowledge" -- beyond both random experience and ratiocination -- sees things not in their temporal dimension, not in their duration and in relation to other particular things, but under the aspect of eternity, that is, abstracted from all considerations of time and place and situated in their relationship to God and his attributes. They are apprehended, that is, in their conceptual and causal relationship to the universal essences (thought and extension) and the eternal laws of nature.

> We conceive things as actual in two ways: either insofar as we conceive them to exist in relation to a certain time and place, or insofar as we conceive them to be contained in God and to follow from the necessity of the divine nature. But the things we conceive in this second way as true, or real, we conceive under a species of eternity, and to that extent they involve the eternal and infinite essence of God. (Vp39s)

But this is just to say that, ultimately, we strive for a knowledge of God. The concept of any body involves the concept of extension; and the concept of any idea or mind involves the concept of thought. But thought and extension just are God's attributes. So the proper and adequate conception of any body or mind necessarily involves the concept or knowledge of God. "The third kind of knowledge proceeds from an adquate idea of certain attributes of God to an adequate knowledge of the essence of things, and the more we understand things in this way, the more we understand God." Knowledge of God is, thus, the Mind's greatest good and its greatest virtue.

What we see when we understand things through the third kind of knowledge, under the aspect of eternity and in relation to God, is the deterministic necessity of all things. We see that all bodies and their states follow necessarily from the essence of matter and the universal laws of physics; and we see that all ideas, including all the properties of minds, follow necessarily from the essence of thought and its universal

laws. This insight can only weaken the power that the passions have over us. We are no longer hopeful or fearful of what shall come to pass, and no longer anxious or despondent over our possessions. We regard all things with equanimity, and we are not inordinately and irrationally affected in different ways by past, present or future events. The result is self-control and a calmness of mind.

> The more this knowledge that things are necessary is concerned with singular things, which we imagine more distinctly and vividly, the greater is this power of the Mind over the affects, as experience itself also testifies. For we see that Sadness over some good which has perished is lessened as soon as the man who has lost it realizes that this good could not, in any way, have been kept. Similarly, we see that [because we regard infancy as a natural and necessary thing], no one pities infants because of their inability to speak, to walk, or to reason, or because they live so many years, as it were, unconscious of themselves. (Vp6s)

Our affects themselves can be understood in this way, which further diminishes their power over us.

Spinoza's ethical theory is, to a certain degree, Stoic, and recalls the doctrines of thinkers such as Cicero and Seneca:

> We do not have an absolute power to adapt things outside us to our use. Nevertheless, we shall bear calmly those things that happen to us contrary to what the principle of our advantage demands, if we are conscious that we have done our duty, that the power we have could not have extended itself to the point where we could have avoided those things, and that we are a part of the whole of nature, whose order we follow. If we understand this clearly and distinctly, that part of us which is defined by understanding, i.e., the better part of us, will be entirely satisfied with this, and will strive to persevere in that satisfaction. For insofar as we understand, we can want nothing except what is necessary, nor absolutely be satisfied with anything except what is true. (IV, Appendix)

What, in the end, replaces the passionate love for ephemeral "goods" is an intellectual love for an eternal, immutable good that we can fully and stably possess, God. The third kind of knowledge generates a love for its object, and in this love consists not joy, a passion, but blessedness itself. Taking his cue from Maimonides's view of human *eudaimonia*, Spinoza argues that the mind's intellectual love of God *is* our understanding of the universe, our virtue, our happiness, our well-being and our "salvation". It is also our freedom and autonomy, as we approach the condition wherein what happens to us follows from our nature (as a determinate and determined mode of one of God's attributes) alone and not as a result of the ways external things affect us. Spinoza's "free person" is one who bears the gifts and losses of fortune with equanimity, does only those things that he believes to be "the most important in life", takes care for the well-being of others (doing what he can to insure that they, too, achieve some relief from the disturbances of the passions through understanding), and is not anxious about death. The free person neither hopes for any eternal, otherworldly rewards nor fears any eternal punishments. He knows that the soul is not immortal in any personal sense, but is endowed only with a certain kind of eternity. The more the mind consists of true and adequate ideas (which are eternal), the more of it remains -- within God's attribute of Thought -- after the death of the body and the disappearance of that part of the mind that corresponds to

the body's duration. This understanding of his place in the natural scheme of things brings to the free individual true peace of mind.

There are a number of social and political ramifications that follow from Spinoza's ethical doctrines of human action and well-being. Because disagreement and discord between human beings is always the result of our different and changeable passions, "free" individuals -- who all share the same nature and act on the same principles -- will naturally and effortlessly form a harmonious society. "Insofar as men are torn by affects that are passions, they can be contrary to one another . . .[But] insofar as men live according to the guidance of reason, they must do only those things that are good for human nature, and hence, for each man, i.e., those things that agree with the nature of each man. Hence, insofar as men live according to the guidance of reason, they must always agree among themselves" (IVp34-35). Free human beings will be mutually beneficial and useful, and will be tolerant of the opinions and even the errors of others. However, human beings do not generally live under the guidance of reason. The state or sovereign, therefore, is required in order to insure -- not by reason, but by the threat of force -- that individuals are protected from the unrestrained pursuit of self-interest on the part of other individuals. The transition from a state of nature, where each seeks his own advantage without limitation, to a civil state involves the universal renunciation of certain natural rights -- such as "the right everyone has of avenging himself, and of judging good and evil" -- and the investment of those prerogatives in a central authority. As long as human beings are guided by their passions, the state is necessary to bring it about that they "live harmoniously and be of assistance to one another".

3. *Theological-Political Treatise*

The ostensive aim of the *Theological-Political Treatise*, widely vilified in its time, is to show that the freedom to philosophize can not only be granted without injury to piety and the peace of the Commonwealth, but that the peace of the Commonwealth and Piety are endangered by the suppression of this freedom". But Spinoza's ultimate intention is reveal the truth about Scripture and religion, and thereby to undercut the political power exercised in modern states by religious authorities. He also defends, at least as a political ideal, the tolerant, secular, and democratic polity.

On Religion and Scripture

Spinoza begins the treatise by alerting his readers, through a kind of "natural history of religion", to just those superstitious beliefs and behaviors that clergy, by playing on ordinary human emotions, encourage in their followers. A person guided by fear and hope, the main emotions in a life devoted to the pursuit of temporal advantages, turns, in the face of the vagaries of fortune, to behaviors calculated to secure the goods he desires. Thus, we pray, worship, make votive offerings, sacrifice and engage in all the various rituals of popular religion. But the emotions are as fleeting as the objects that occasion them, and thus the superstitions grounded in those emotions subject to fluctuations. Ambitious and self-serving clergy do their best to stabilize this situation and give some permanence to those beliefs and behaviors. "Immense efforts have been made to invest religion, true or false, with such pomp and ceremony that it can sustain any shock and constantly evoke the deepest reverence in all its worshippers." Religious leaders are

generally abetted in their purposes by the civil authority, which threatens to punish all deviations from theological orthodoxy as "sedition". The result is a state religion that has no rational foundations, a mere "respect for ecclesiastics" that involves adulation and mysteries but no true worship of God.

The solution to this state of affairs, Spinoza believes, is to examine the Bible anew and find the doctrines of the "true religion". Only then will we be able to delimit exactly what we need to do to show proper respect for God and obtain blessedness. This will reduce the sway that religious authorities have over our emotional, intellectual and physical lives, and reinstate a proper and healthy relationship between the state and religion. A close analysis of the Bible is particularly important for any argument that the freedom of philosophizing -- essentially, freedom of thought and speech -- is not prejudicial to piety. If it can be demonstrated that Scripture is not a source of "natural truth", but the bearer of only a simple moral message ("Love your neighbor"), then people will see that "faith is something separate from philosophy". Spinoza intends to show that in that moral message alone -- and not in Scripture's words or history -- lies the sacredness of what is otherwise merely a human document. The Bible teaches only "obedience [to God]", not knowledge. Thus, philosophy and religion, reason and faith, inhabit two distinct and exclusive spheres, and neither should tread in the domain of the other. The freedom to philosophize and speculate can therefore be granted without any harm to true religion. In fact, such freedom is essential to public peace and piety, since most civil disturbances arise from sectarian disputes. The real danger to the Republic comes from those who would worship not God, but some words on a page: "It will be said that, although God's law is inscribed in our hearts, Scripture is nevertheless the Word of God, and it is no more permissable to say of Scripture that it is mutilated and contaminated than to say this of God's Word. In reply, I have to say that such objectors are carrying their piety too far, and are turning religion into superstition; indeed, instead of God's Word they are beginning to worship likenesses and images, that is, paper and ink."

From a proper and informed reading of Scripture, a number of things become clear. First, the prophets were not men of exceptional intellectual talents -- they were not, that is, naturally gifted philosophers -- but simply very pious, even morally superior individuals endowed with vivid imaginations. They were able to perceive God's revelation through their imaginative faculties via words or real or imaginary figures. This is what allowed them to apprehend that which lies beyond the boundary of the intellect. Moreover, the content of a prophecy varied according to the physical temperament, imaginative powers, and particular opinions or prejudices of the prophet. It follows that prophecy, while it has its origins in the power of God -- and in this respect it is, in Spinoza's metaphysical scheme, no different from any other natural event -- does not provide privileged knowledge of natural or spiritual phenomena. The prophets are not necessarily to be trusted when it comes to matters of the intellect, on questions of philosophy, history or science; and their pronouncements set no parameters on what should or should not be believed about the natural world on the basis of our rational faculties.

Spinoza provides an equally deflationary account of God's election, or the "vocation", of the Hebrews. It is "childish", he insists, for anyone to base their happiness on the uniqueness of their gifts; in the case of the Jews, it would be the uniqueness of their being chosen among all people. The ancient Hebrews, in fact, did not surpass other nations in their wisdom or in their proximity to God. They were neither intellectually nor morally superior to other peoples. They were "chosen" only with respect to their social

organization and political good fortune. God (or Nature) gave them a set of laws and they obeyed those laws, with the natural result that their society was well-ordered and their autonomous government persisted for a long time. Their election was thus a temporal and conditional one, and their kingdom is now long gone. Thus, "at the present time there is nothing whatsoever that the Jews can arrogate to themselves above other nations." Spinoza thereby rejects the particularism that many -- including Amsterdam's Sephardic rabbis -- insisted was essential to Judaism. True piety and blessedness are universal in their scope and accesssible to anyone, regardless of their confessional creed.

Central to Spinoza's analysis of the Jewish religion -- although it is applicable to any religion whatsoever -- is the distinction between the divine law and the ceremonial law. The law of God commands only the knowledge and love of God and the actions required for attaining that condition. Such love must arise not from fear of possible penalties or hope for any rewards, but solely from the goodness of its object. The divine law does *not* demand any particular rites or ceremonies such as sacrifices or dietary restrictions or festival observances. The six hundred and thirteen precepts of the Torah have nothing to do with blessedness or virtue. They were directed only at the Hebrews so that they might govern themselves in an autonomous state. The ceremonial laws helped preserve their kingdom and insure its prosperity, but were valid only as long as that political entity lasted. They are not binding on all Jews under all circumstances. They were, in fact, instituted by Moses for a purely practical reason: so that people might do their duty and not go their own way. This is true not just of the rites and practices of Judaism, but of the outer ceremonies of all religions. None of these activities have anything to do with true happiness or piety. They serve only to control people's behavior and preserve a particular society.

A similar practical function is served by stories of miracles. Scripture speaks in a language suited to affect the imagination of ordinary people and compel their obedience. Rather than appealing to the natural and real causes of all events, its authors sometimes narrate things in a way calculated to move people -- particularly uneducated people -- to devotion. "If Scripture were to describe the downfall of an empire in the style adopted by political historians, the common people would not be stirred . . ." Strictly speaking, however, miracles -- understood as divinely caused departures from the ordinary course of nature -- are impossible. Every event, no matter how extraordinary, has a natural cause and explanation. "Nothing happens in nature that does not follow from her laws." This is simply a consequence of Spinoza's metaphysical doctrines. Miracles as traditionally conceived require a distinction between God and nature, something that Spinoza's philosophy rules out in principle. Moreover, nature's order is inviolable in so far as the sequence of events in nature is a necessary consequence of God's attributes. There certainly are "miracles" in the sense of events whose natural causes are unknown to us, and which we therefore attribute to the powers of a supernatural God. But this is, once again, to retreat to superstition, "the bitter enemy of all true knowledge and true morality".

By analyzing prophecy in terms of vividness of imagination, Jewish election as political fortune, the ceremonial law as a kind of social and political expediency, and the belief in miracles as an ignorance of nature's necessary causal operations, Spinoza naturalizes (and, consequently, demystifies) some of the fundamental elements of Judaism and other religions and undermines the foundations of their external, superstitious rites. At the same time, he thereby reduces the fundamental doctrine of piety to a simple and universal formula, naturalistic in itself, involving love and knowledge. This process of naturalization

achieves its stunning climax when Spinoza turns to consider the authorship and interpretation of the Bible itself. Spinoza's views on Scripture constitute, without question, the most radical theses of the *Treatise*, and explain why he was attacked with such vitriol by his contemporaries. Others before Spinoza had suggested that Moses was not the author of the entire Pentateuch. But no one had taken that claim to the extreme limit that Spinoza did, arguing for it with such boldness and at such length. Nor had anyone before Spinoza been willing to draw from it the conclusions about the status, meaning and interpretation of Scripture that Spinoza drew.

Spinoza denied that Moses wrote all, or even most of the Torah. The references in the Pentateuch to Moses in the third person; the narration of his death and, particularly, of events following his death; and the fact that some places are called by names that they did not bear in the time of Moses all "make it clear beyond a shadow of doubt" that the writings commonly referred to as "the Five Books of Moses" were, in fact, written by someone who lived many generations after Moses. Moses did, to be sure, compose some books of history and of law; and remnants of those long lost books can be found in the Pentateuch. But the Torah as we have it, as well as as other books of the Hebrew Bible (such as Joshua, Judges, Samuel and Kings) were written neither by the individuals whose names they bear nor by any person appearing in them. Spinoza believes that these were, in fact, all composed by a single historian living many generations after the events narrated, and that this was most likely Ezra. It was the post-exilic leader who took the many writings that had come down to him and began weaving them into a single (but not seamless) narrative. Ezra's work was later completed and supplemented by the editorial labors of others. What we now possess, then, is nothing but a compilation, and a rather mismanaged, haphazard and "mutilated" one at that.

As for the books of the Prophets, they are of even later provenance, compiled (or "heaped together", in Spinoza's view) by a chronicler or scribe perhaps as late as the Second Temple period. Canonization into Scripture occurred only in the second century BCE, when the Pharisees selected a number of texts from a multitude of others. Because the process of transmission was a historical one, involving the conveyence of writings of human origin over a long period of time through numerous scribes, and because the decision to include some books but not others was made by fallible human beings, there are good reasons for believing that a significant portion of the text of the "Old Testament" is corrupt.

Now in 1670 there was nothing novel in claiming that Moses did not write all of the Torah. Spinoza's most radical and innovative claim, in fact, was to argue that this holds great significance for how Scripture is to be read and interpreted. He was dismayed by the way in which Scripture itself was worshipped, by the reverence accorded to the words on the page rather than to the message they conveyed. If the Bible is an historical (i.e., natural) document, then it should be treated like any other work of nature. The study of Scripture, or Biblical hermeneutics, should therefore proceed as the study of nature, or natural science proceeds: by gathering and evaluating empirical data, that is, by examining the "book" itself -- along with the contextual conditions of its composition -- for its general principles.

> I hold that the method of interpreting Scripture is no different from the method of interpreting Nature, and is in fact in complete accord with it. For the method of interpreting Nature consists essentially in composing a detailed study of Nature from which, as being

> the source of our assured data, we can deduce the definitions of the things of Nature. Now in exactly the same way the task of Scriptural interpretation requires us to make a straightforward study of Scripture, and from this, as the source of our fixed data and principles, to deduce by logical inference the meaning of the authors of Scripture. In this way -- that is, by allowing no other principles or data for the interpretation of Scripture and study of its contents except those that can be gathered only from Scripture itself and from a historical study of Scripture -- steady progress can be made without any danger of error, and one can deal with matters that surpass our understanding with no less confidence than those matters that are known to us by the natural light of reason.

Just as the knowledge of nature must be sought from nature alone, so must the knowledge of Scripture -- an apprehension of its intended meaning -- be sought from Scripture alone and through the appropriate exercise of rational inquiry.

When properly interpreted, the universal message conveyed by Scripture is a simple moral one: "To know and love God, and to love one's neighbor as oneself". This is the *real* word of God and the foundation of true piety, and it lies uncorrupted in a faulty, tampered and corrupt text. The lesson involves no metaphysical doctrines about God or nature, and requires no sophisticated training in philosophy. The object of Scripture is not to impart knowledge, but to compel obedience and regulate our conduct. "Scriptural doctrine contains not abstruse speculation or philosophic reasoning, but very simple matters able to be understood by the most sluggish mind." Spinoza claims, in fact, that a familiarity with Scripture is not even necessary for piety and blessedness, since its message can be known by our rational faculties alone, although with great difficulty for most people. "He who, while unacquainted with these writings, nevertheless knows by the natural light that there is a God having the attributes we have recounted, and who also pursues a true way of life, is altogether blessed."

It follows that the only practical commandments that properly belong to religion are those that are necessary to carry out the moral precept and "confirm in our hearts the love of our neighbor". "A catholic faith should therefore contain only those dogmas which obedience to God absolutely demands, and without which such obedience is absolutely impossible . . . these must all be directed to this one end: that there is a Supreme Being who loves justice and charity, whom all must obey in order to be saved, and must worship by practicing justice and charity to their neighbor." As for other dogmas, "every person should embrace those that he, being the best judge of himself, feels will do most to strengthen in him love of justice".

This is the heart of Spinoza's case for toleration, for freedom of philosophizing and freedom of religious expression. By reducing the central message of Scripture -- and the essential content of piety -- to a simple moral maxim, one that is free of any superfluous speculative doctrines or ceremonial practices; and by freeing Scripture of the burden of having to communicate specific philosophical truths or of prescribing (or proscribing) a multitude of required behaviors, he has demonstrated both that philosophy is independent from religion and that the liberty of each individual to interpret religion as he wishes can be upheld without any detriment to piety.

> As to the question of what God, the exemplar of true life, really is, whether he is fire, or spirit, or light, or thought, or something else, this is irrelevant to faith. And so likewise is the question as to why he is the exemplar of true life, whether this is because he has a just and merciful disposition, or because all things exist and act through him and consequently we, too, understand through him, and through him we see what is true, just and good. On these questions it matters not what beliefs a man holds. Nor, again, does it matter for faith whether one believes that God is omnipresent in essence or in potency, whether he directs everything from free will or from the necessity of his nature, whether he lays down laws as a rule or teaches them as being eternal truths, whether man obeys God from free will or from the necessity of the divine decree, whether the rewarding of the good and the punishing of the wicked is natural or supernatural. The view one takes on these and similar questions has no bearing on faith, provided that such a belief does not lead to the assumption of greater license to sin, or hinders submission to God. Indeed . . . every person is in duty bound to adapt these religious dogmas to his own understanding and to interpret them for himself in whatever way makes him feel that he can the more readily accept them with full confidence and conviction.

Faith and piety belong not to the person who has the most rational argument for the existence of God or the most thorough philosophical understanding of his attributes, but to the person "who best displays works of justice and charity".

The State

Spinoza's account of religion has clear political ramifications. There had always been a quasi-political agenda behind his decision to write the *Treatise*, since his attack was directed at political meddling by religious authorities. But he also took the opportunity to give a more detailed and thorough presentation of a general theory of the state that is only sketchily present in the *Ethics*. Such an examination of the true nature of political society is particularly important to his argument for intellectual and religious freedom, since he must show that such freedom is not only compatible with political well-being, but essential to it.

The individual egoism of the *Ethics* plays itself out in a pre-political context -- the so-called "state of nature", a universal condition where there is no law or religion or moral right and wrong -- as the right of every individual to do whatever he can to preserve himself. "Whatever every person, whenever he is considered as solely under the dominion of Nature, believes to be to his advantage, whether under the guidance of sound reason or under passion's sway, he may by sovereign natural right seek and get for himself by any means, by force, deceit, entreaty, or in any other way he best can, and he may consequently regard as his enemy anyone who tries to hinder him from getting what he wants." Naturally, this is a rather insecure and dangerous condition under which to live. In Hobbes' celebrated phrase -- and Spinoza was clearly influenced by his reading of that British thinker -- life in the state of nature is "solitary, poor, nasty, brutish and short". As rational creatures, we soon realize that we would be better off, still from a thoroughly egoistic perspective, coming to an agreement among ourselves to restrain our opposing desires and the unbounded pursuit of self-interest -- in sum, that it would be in our greater self-interest to live under the law of reason rather than the law of nature. We thus agree to hand over to a

sovereign our natural right and power to do whatever we can to satisfy our interests. That sovereign -- whether it be an individual (in which case the resulting state is a monarchy), a small group of individuals (an oligarchy) or the body-politic as a whole (a democracy) -- will be absolute and unrestrained in the scope of its powers. It will be charged with keeping all the members of society to the agreement, mostly by playing on their fear of the consequences of breaking the "social contract".

Obedience to the sovereign does not infringe upon our autonomy, since in following the commands of the sovereign we are following an authority whom we have freely authorized and whose commands have no other object than our own rational self- interest. The type of government most likely to respect and preserve that autonomy, issue laws based on sound reason and to serve the ends for which government is instituted is democracy. It is the "most natural" form of governing arising out of a social contract -- since in a democracy the people obey only laws that issue from the general will of the body politic -- and the least subject to various abuses of power. In a democracy, the rationality of the sovereign's commands is practically secured, since it is unlikely that a majority of a large number of people will agree to an irrational design. Monarchy, on the other hand, is the least stable form of government and the one most likely to degenerate into tyranny.

Since the outward practices of religion impinge upon the comportment and relations of citizens, they fall under "state business" and, thus, within the sphere of the sovereign's power. The sovereign should have complete dominion in all public matters secular and spiritual. There should be no church separate from the religion instituted and regulated by the state. This will prevent sectarianism and the multiplication of religious disputes. All questions concerning external religious rites and ceremonies are in the hands of the sovereign. This is in the best interest of everyone, since the sovereign will, ideally and in conformity with its "contractual" duty, insure that such practices are in accord with public peace and safety and social well-being. The sovereign should rule in such a way that his commands enforce God's law. Justice and charity thereby acquire the force of civil law, backed by the power of the sovereign.

On the other hand, dominion over the "inward worship of God" and the beliefs accompanying it -- in other words, inner piety -- belongs exclusively to the individual. This is a matter of inalienable, private right, and it cannot be legislated, not even by the sovereign. No one can limit or control another person's thoughts anyway, and it would be foolhardy and destructive to the polity for a sovereign to attempt to do so. Nor can speech ever truly and effectively be controlled, since people will always say want they want, at least in private. "Everyone is by absolute natural right the master of his own thoughts, and thus utter failure will attend any attempt in a commonwealth to force men to speak only as prescribed by the sovereign despite their different and opposing opinions." There must, Spinoza grants, be *some* limits to speech and teaching. Seditious discourse that encourages individuals to nullify the social contract should not be tolerated. But the best government will err on the side of leniency and allow the freedom of philosophical speculation and the freedom of religious belief. Certain "inconveniences" will, no doubt, sometimes result from such an extensive liberty. But the attempt to regulate everything by law is "more likely to arouse vices than to reform them". In a passage that foreshadows John Stuart Mill's utilitarian defense of liberty nearly two centuries later, Spinoza adds that "this freedom is of the first importance in fostering the sciences and the arts, for only those whose judgment is free and unbiased can attain success in these fields."

It is hard to imagine a more passionate and reasoned defense of freedom and toleration than that offered by Spinoza.

Medieval Theories of Modality

There are four modal paradigms in ancient philosophy: the ‘statistical’ or ‘temporal frequency interpretation’ of modality, the model of possibility as a potency, the model of antecedent necessities and possibilities with respect to a certain moment of time (diachronic modalities), and the model of possibility as non-contradictoriness. None of these conceptions, which were well known to early medieval thinkers through the works of Boethius, was associated with the idea of modality as involving reference to simultaneous alternatives. This new paradigm was introduced into Western thought in early twelfth-century discussions influenced by Augustine's theological conception of God as acting by choice between alternative histories. Ancient habits of thinking continued to play an important role in scholasticism, however, and the theoretical significance of the new conception was not fully realized before the works of John Duns Scotus and some other early fourteenth century thinkers.

Aspects of Ancient Modal Paradigms

In speaking about the general features of the universe, ancient philosophers were inclined to think that all generic possibilities will be actualized, a habit of thinking called the principle of plenitude by Arthur O. Lovejoy (1936). Correspondingly, it was natural for them to think that the types of things which never occur are impossible and that the invariant structures of reality are necessary. This line of thought is found, e.g., in Plato's doctrine of ideas which are exhaustively imitated in the Receptacle, in Aristotle's theory of the priority of actuality over potentiality, in the Stoic doctrine of God, the world-order, and the eternal cosmic cycle, and in Plotinus's metaphysics of emanation (Knuuttila 1993).

In these approaches to the constituents of the universe, modal terms are used in accordance with the so-called ‘statistical’ or ‘temporal frequency’ model of modality where the meaning of modal terms is

spelled out extensionally as follows: what is necessary is always actual, what is impossible is never actual and what is possible is at least sometimes actual. The term 'statistical interpretation of modality' was introduced into the modern discussion by Oscar Becker (1952), and it has been applied since in descriptions of certain ways of thinking in the history of philosophy as well, particularly by Jaakko Hintikka (1973).

Even though Aristotle did not define modal terms with the help of extensional notions, this model can be found in his discussion of eternal beings, the natures of things, the types of events, or generic statements about such things. Modal terms refer to the one and only world of ours and classify the types of things and events on the basis of their occurrence. This paradigm suggests that actualization is the general criterion of the genuineness of possibilities, but the deterministic implications of this view compelled Aristotle to seek ways of speaking about unrealized singular possibilities. Diodorus Chronus (fl. 300 B.C.) was a determinist who found no problem in this way of thinking. (For different interpretations and evaluations of the role of this model in Aristotle, see Hintikka 1973, Sorabji 1980, Seel 1982, Waterlow 1982a, White 1985, van Rijen 1989, Gaskin 1995.) In *Posterior Analytics* I.6 Aristotle seems to imply that certain predicates may belong to their subjects at all times without belonging to them necessarily. Averroes and his followers took this to mean that invariant connections are necessary in a strict sense (*per se*) only if they are essential; otherwise they are accidentally necessary (Lagerlund 1999). This is one of the texts some modern scholars have referred to in arguing that Aristotle's views showing similarities to the statistical model are not based on the meaning of modal terms but on some special metaphysical and ontological doctrines (van Rijen 1989; cf. Waterlow 1982a).

Another Aristotelian modal paradigm was that of possibility as potency. In *Met*. V.12 and IX.1 potency is said to be the principle of motion or change either as the activator or as the receptor of a relevant influence. (For agent and patient in Aristotle's natural philosophy in general, see Waterlow 1982b.) The types of potency-based possibilities belonging to a species are recognized as possibilities because of their actualization - no natural potency type remains eternally frustrated. Aristotle says that when the agent and the patient come together as being capable, the one must act and the other must be acted on (*Met*. IX.5). I shall return to this formulation.

In *De Caelo* I.12 Aristotle supposes, *per impossibile*, that a thing has contrary potencies, one of which is always actualized. He argues that the alleged unactualized potencies cannot be real, because one cannot assume them to be realized at any time without contradiction. Aristotle applies here the model of possibility as non-contradictoriness which is defined in *Prior Analytics* I.13 as follows: when a possibility is assumed to be realized, it results in nothing impossible. In speaking about the assumed non-contradictory actualization of a possibility Aristotle thinks that it is realized in our one and only history. The argument in *De caelo* excludes from the set of genuine possibilities those which remain eternally unrealized. It also shows how strongly Aristotle's modal thought was influenced by the absence of the idea of synchronic alternatives. (See also *Met*. IX.4.)

Aristotle heavily criticized some of his contemporaries who claimed that only that which takes place is possible (*Met*. IX.3). His problem was that the assumptions of his modal thinking pushed him towards a very similar position with respect to singular possibilities. In Chapter 9 of *De interpretatione* Aristotle

says that what is necessarily is when it is, but he then qualifies this necessity of the present with the remark that it does not follow that what is actual is necessary without qualification. If he meant that the temporal necessity of a present event does not imply that such an event necessarily takes place in circumstances of that type, this is an unsatisfactory attempt to avoid the problem that changeability as a criterion of contingency makes all temporally definite singular events necessary (Hintikka 1973). Another possibility is that Aristotle wanted to show that the necessity of an event at a certain time does not imply that it would have been antecedently necessary (von Wright 1984). The remark on the necessity of the present is included in Aristotle's discussion of future contingent statements which is one of the most controversial themes of Aristotle's philosophy. The model of possibility as potency *prima facie* allowed Aristotle to speak about all kinds of unrealized singular possibilities by referring to passive or active potencies, but taken separately they represent partial possibilities which do not guarantee that their actualization can take place. More is required for a real singular possibility, but when the further requirements are added, such as a contact between the active and passive factor and the absence of an external hindrance, the potency model suggests that the potency can really be actualized only when a change towards its end is initiated (*Met*. IX.5, *Phys*. VIII.1). Some scholars have referred to the diachronic idea that the conditions which at t_1 ($t_1 < t_2$) are necessary for the obtaining of ‘p’ at t_2 are not necessarily sufficient for the obtaining of ‘*p*’ though they are sufficient for the possibility (at t_1) that ‘*p*’ obtains at t_2 (Gaskin 1995). Unfortunately Aristotle seldom was that explicit. Some others have paid attention to Aristotle's definition of the time-taking process (*kinêsis*) as the actuality of the potentiality (of the end) *qua* potentiality (*Phys*. III.1), but this did not help him more than offering a place for full singular possibilities of what will be (Hintikka et al. 1977).

Aristotle's conceptual difficulties can be seen from his various attempts to characterize the possibilities based on dispositional properties such as heatable, separable, or countable. Analogous discussions were not unusual in later ancient philosophy. In Philo's definition of possibility (ca. 300 B.C.), the existence of a passive potency was regarded as a sufficient ground for speaking about a singular possibility. The Stoics revised this definition by adding the condition of the absence of external hindrance, thinking that otherwise the alleged possibility could not be realized. They did not add that an activator is needed as well, because then the difference between potentiality and actuality would disappear. According to the deterministic Stoic world view, fate as a kind of active potency necessitates everything, but the number of passive potencies with respect to a definite future instant of time (t_1) is greater than what will be realized. As long as these possibilities are not prevented from being realized by other things which will be actual at t_1, they in some sense represent open possibilities. When t_1 is present, all unrealized possibilities are prevented from being actualized by other things. (The Stoics did not accept the Master Argument of Diodorus Cronus against possibilities which will not be realized.) Passive potencies as alternative prospective possibilities show what might happen at a certain moment, but because everything is determined, the alternatives seem to be only epistemic possibilities relative to our ignorance. (For different interpretations of the Stoic and Megarian conceptions of modality, see Vuillemin 1984, White 1985, Bobzien 1986, Engberg-Pedersen 1990, Bobzien 1993, Gaskin 1995.)

Alexander of Aphrodisias claimed in *De fato* that the Peripatetics, as distinct from the Stoics, thought that there are genuine prospective alternatives which remain open options until the moment of time to which

they refer. It was the Stoic doctrine of future alternatives which led Alexander to consider diachronic modalities which he then tried to interpret in a different way (Sharples 1983). Aristotle sometimes referred to diachronic modalities of this kind (*Met*. VI.3), but he did not elaborate this idea, which might have been his most promising attempt to formulate a theory of unrealized singular possibilities. (The importance of this model is particularly stressed in Waterlow 1982a; see also Weidemann 1986, Gaskin 1995.) Neither Aristotle nor his followers had any conception of synchronic alternatives. They thought that what is necessarily is when it is, and that the alternative possibilities disappear when the future is fixed. The Peripatetic theory of alternative prospective possibilities could be called the model of diachronic modalities without synchronic alternatives: there are transient singular alternative possibilities, but those which will not be realized disappear instead of remaining unrealized.

Early Medieval Developments

The early medieval thinkers were well acquainted with ancient modal conceptions through Boethius's works. One of the Aristotelian modal paradigms occurring in Boethius is that of possibility as potency (*potestas*, *potentia*). According to Boethius, when the term ‘possibility’ (*possibilitas*) is applied in the sense of ‘potency’, it refers to real powers or tendencies, the ends of which are either actual or non-actual at the moment of utterance. Some potencies are never unrealized. They are said to be necessarily actual. When potencies are not actualized, their ends are said to exist potentially (*In Periherm*. II.453-455). Necessarily actual potencies leave no room for the potencies of their contraries, for they would remain unrealized forever and the constitution of nature cannot include elements which would be in vain (*In Periherm*. II. 236, 243). The potencies of non-necessary features of being do not exclude contrary potencies. They are not always and universally actualized, but as potency-types even these potencies are taken to satisfy the actualization criterion of genuineness (*In Periherm*. I.120-1, II.237).

Boethius's view that the types of potencies and potency based possibilities are sometimes actualized is in agreement with the Aristotelian statistical interpretation of modality. This is another Boethian conception of necessity and possibility. He thought that modal notions can be regarded as tools for expressing temporal or generic frequencies. According to the temporal version, what always is is by necessity, and what never is is impossible. Possibility is interpreted as expressing what is at least sometimes actual. Correspondingly, a generic property of a species is possible only if it is exemplified at least in one member of that species (*In Periherm*. I.120-1, 200-201, II.237, 239).

Like Aristotle, Boethius often treated statement-making utterances as temporally indeterminate sentences. The same sentence can be uttered at different times, and many of these temporally indeterminate sentences may sometimes be true and sometimes false, depending on the circumstances at the moment of utterance. If the state of affairs the actuality of which makes the sentence true is omnitemporally actual, the sentence is true whenever it is uttered. In this case, it is necessarily true. If the state of affairs associated with an assertoric sentence is always non-actual, the sentence is always false and therefore impossible. A sentence is possible only if what is asserted is not always non-actual (I.124-125). The statistical interpretation of modal terms is also employed in Ammonius's Greek commentary on Aristotle's *De interpretatione* which shares some sources with Boethius's work (88.12-28).

In dealing with Chapter 9 of Aristotle's *De interpretatione* Boethius argues (II.241) that because

> (1) $M(p_t \ \& \ \neg p_t)$
> (1) It is possible that p obtains at t and not-p obtains at t.

is not acceptable, one should also deny

> (2) $p_t \ \& \ M_t \neg p_t$
> (2) p obtains at t and it is possible at t that not-p obtains at t.

The denial of (2) is equivalent to

> (3) $p_t \rightarrow L_t p_t$
> (3) If p obtains at t then it is necessary at t that p obtains at t.

This line of thought is natural only when possibilities are treated without any idea of synchronic alternatives. (2) was generally denied in ancient philosophy and its denial was taken as an axiom by Boethius as well. Correspondingly, (3) shows how the necessity of the present was understood in ancient thought. Boethius thought that the temporal necessity of *p* can be qualified by shifting attention from temporally definite cases or statements to their temporally indeterminate counterparts (I.121-122, II.242-3). The same statistical idea occurs in Ammonius (153.24-6). This was one of Boethius's interpretations of the Aristotelian distinction between necessity now and necessity without qualification. But he also made use of the diachronic model according to which the necessity of ‘*p*’ at *t* does not imply that, before *t*, it is necessary that ‘*p*’ obtains at *t*.

Boethius developed the diachronic ideas as part of his criticism of Stoic determinism. If it is not true that everything is causally necessitated, there must be genuine alternatives in the course of events. Free choice was the source of contingency in which Boethius was mainly interested, but he thought in addition that according to the Peripatetic doctrine there is a real factor of indeterminacy in the causal nexus of nature. When Boethius refers to chance, free choice, and possibility in this context, his examples include temporalized modal notions which refer to diachronic prospective possibilities at a given moment of time. A temporally determinate prospective possibility is unrealized before the time to which it refers, and it may be not realized even when the time is present. This means, however, that the possibility no longer exists. Boethius did not develop the idea of simultaneous synchronic possibilities which would remain intact even when diachronic possibilities had vanished. On the contrary, he insisted that only what is actual at a certain time is at that time possible at that time (cf. (3) above). But he also thought that there are objective singular contingencies, so that the result of some prospective possibilities is indefinite and uncertain ‘not only to us who are ignorant, but to nature’ (*In Periherm*. I.106, 120, II.190-192, 197-198, 203, 207). Boethius's modal paradigms are discussed in Kretzmann 1985, Mignucci 1989, and Knuuttila 1993.

As for future contingent statements, Boethius seems to think the principle of bivalence is universally valid, but statements about future contingents, unlike those about past and present things, do not obey the stronger principle that each affirmative or negative statement is either determinately true or determinately false. A true statement is indeterminately true as long as the conditions which make it true are not yet fixed (*In Periherm*. I.125, II.208; Mignucci 1989). Boethius's formulations are somewhat ambiguous and it is possible that ‘indeterminate truth’ sometimes means that a statement will be either true or false (Kretzmann 1987). The first alternative became the standard medieval view, but there were different opinions of whether Aristotle abandoned bivalence for future contingent statements. (See Normore 1982, Lewis 1987, Normore 1993.) Boethius, Thomas Aquinas, and many others thought that God can know future contingents only because the flux of time is present to divine eternity. Many late medieval thinkers defended God's ability to foreknow free acts. This led to the so called middle knowledge theory of the counterfactuals of freedom (Craig 1988, Freddoso 1988).

From the point of view of the history of modal thought, interesting things took place in theology in the eleventh and twelfth centuries. Augustine had already criticized the application of the statistical model of possibility to divine power; for him, God has freely chosen the actual world and its providential plan from alternatives which he could have realized but did not will to do (*potuit sed noluit*). This way of thinking differs from ancient philosophical modal paradigms, because the metaphysical basis is now the eternal domain of alternative possible histories instead of the idea of one necessary world order (*De spiritu et littera* 1-2, *De civitate Dei* 12.19, 21.5-10, 22.4, 11, *Contra Faustum* 29.4). The idea of a discrepancy between the Catholic doctrine of God's freedom and power and the philosophical modal conceptions was brought into the scope of discussion by Peter Damian's *De divina omnipotentia* (Holopainen 1996) and was developed in a more sophisticated way by Peter Abelard, Gilbert of Poitiers and some other twelfth century authors. This is how the new modal paradigm based on the idea of synchronic alternatives became a part of Western theology, and it was particularly applied in the discussions of the distinction between God's absolute and ordained power and between divine and natural possibilities.

The modal paradigm based on synchronic alternatives was very different from the traditional ones, but there were few people in the twelfth and thirteenth centuries to realize its general philosophical significance. It was more usual to consider it a specially theological matter which did not affect the use of traditional modal paradigms in other disciplines. Abelard and Gilbert were inclined to think in this way, and this attitude was supported by the general reception of Aristotle's philosophy which clearly contributed to the frequent use of the Aristotelian modal paradigms in thirteenth century logical treatises on modalities, in metaphysical theories of the principles of being, and in the discussions of causes and effects in natural philosophy (Knuuttila 1993; for Jewish and Arabic discussions, see also Rescher 1974, Manekin 1992, Bäck 1992).

Modalities in Thirteenth Century Logical Treatises

The anonymous *Dialectica Monacensis* (ca. 1200) is one of the numerous works representing the new terminist approach to logic and can be used as an example of how modalities were treated in it. (A collection of late twelfth and early thirteenth century logical texts is edited in de Rijk 1962-67.) In

discussing the quantity (universal, particular, singular) and quality (affirmative, negative) of the modals, the author states that modal terms may be adverbial or nominal. The modal adverb qualifies the copula, and the structure of the sentence can be described as follows:

> (4) quantity/subject/modalized copula/predicate (Some A's are necessarily B)

In this form, the negation can be located in different places, either

> (5) quantity/subject/copula modalized by a negated mode/predicate (Some A's are-not-necessarily B)

or

> (6) quantity/subject/modalized negative copula/predicate (Some A's are-necessarily-not B)

If sentences with a negation sign are read in accordance with (5), then the mode is denied in them; if they are read in accordance with (6), the modal adverb qualifies a negated predication (De Rijk 1967, II-2, 479.35-480.3).

As for the modal sentences with nominal modes, the author says that they can be read in two ways. One can apply an adverbial type of reading to them, which is said to be how Aristotle treats modal sentences in the *Prior Analytics*. The quality and quantity of such a *de re* modal sentence is determined by the corresponding non-modal sentence. In a *de dicto* modal sentence that which is asserted in a non-modal sentence is considered as the subject about which the mode is predicated. When modal sentences are understood in this way, they are always singular, their form being:

> (7) subject/copula/mode. (That some A's are B is necessary.)

This reading is said to be the one which Aristotle presented in *De interpretatione* (480.3-26). The idea of the systematic distinction between the readings *de dicto* (*in sensu composito*) and *de re* (*in sensu diviso*) of modally qualified statements was introduced into medieval discussions in Abelard's investigations of modal statements (*Super Periherm*. 3-47, *Dialectica* 191.1-210.19), and was often mentioned, as in the *Dialectica Monacensis*, in discussions of the composition-division ambiguity of sentences.

The author of the *Dialectica Monacensis* says that the matter of an assertoric sentence may be natural, remote, or contingent. True affirmative sentences about a natural matter maintain the existence of natural compounds which cannot be otherwise; these sentences as well as the natural compounds are called necessary. False affirmative sentences about a remote matter maintain the existence of compounds which are necessarily non-existent; they are called impossible. Sentences about a contingent matter are about compounds which can be actual and which can be non-actual (472.9-473.22). The theory of the modal matter was popular in early medieval logic and was also dealt with in mid-thirteenth century handbooks. Another often discussed theme was the distinction between modalities *per se* and *per accidens* which was

based on the idea that the modal status of a temporally indefinite sentence may be changeable or not - for example ‘You have not been in Paris’ may begin to be impossible, whereas ‘You either have or have not been in Paris’ may not. Another distinction between sentences necessary *per se* and *per accidens* was based on Aristotle's theory of *per se* predication in *Posterior Analytics* I.4. A sentence was said to be accidentally necessary when it was unchangeably true but there was no conceptual connection between subject and predicate.

One example of the prevalence of the traditional use of modal notions can be found in the early medieval *de dicto/de re* analysis of examples such as ‘A standing man can sit’. It was commonly stated that the composite (*de dicto*) sense is ‘It is possible that a man sits and stands at the same time’ and that on this reading the sentence is false. The divided (*de re*) sense is ‘A man who is now standing can sit’ and on this reading the sentence is true. Many authors formulated the divided possibility as follows: ‘A standing man can sit at another time’. It was assumed that a possibility refers to an actualization in the one and only world history and that it cannot refer to the present moment because of the necessity of the present understood in the Aristotelian sense formulated in (2) and (3) above. When authors referred to another time, some of them thought in accordance with the statistical model that the possibility would be realized at that time. But the Boethian idea of diachronic prospective alternatives was also often used in thirteenth century logical treatises, and some authors thought that the divided possibility refers to the future even though it may remain unrealized. A third group of authors made use of the modern idea of synchronic alternatives in this connection. The composite reading refers then to one and the same state of affairs and the divided reading to alternative states of affairs (at the same time). This analysis was also applied to the question of whether God's knowledge of things makes them necessary. (There are textual references for all these themes in Knuuttila 1993. See also Maierù 1972, Jacobi 1980.)

The variety of intuitions about the meanings of modal notions may be one of the reasons for the fact that the logical analysis of *de re* modalities remained sketchy in early terminist logic. Modifying Boethius's systematization of Aristotle's remarks in *De interpretatione* 12 and 13, the logicians often presented the equipollences and other relations between unanalysed modals with the help of a square of opposition. Abelard's attempt to extend this analysis to quantified *de re* modals was badly confused (*Super Periherm*. 26.8-15) and the later progress in this area was slow. It was only in the fourteenth century that they were analysed in a satisfactory manner. (See Hughes 1989 and his description of Buridan's octagon of modal opposites and equipollences.)

Dialectica Monacensis involves a brief summary of Aristotle's modal syllogistic. (Its first Latin discussion is found in an anonymous twelfth century commentary on the *Prior Analytics*; Ebbesen 1981.) The first thorough commentary was Robert Kilwardby's *In libros Priorum Analyticorum expositio* (ca. 1240). Albert the Great's comments on modal syllogisms in his commentary on the *Prior Analytics* were mainly derived from Kilwardby's work. Abelard, who did not deal with Aristotle's modal syllogistics, said that the modals in mixed syllogisms with both modal and assertoric premises should be read *de re* (*Super Periherm*. 10.22-11.16) This became a common view before Aristotle's modal syllogistic was studied in any detail. Although the reception of the *Prior Analytics* with this interpretation strengthened the interest in quantified modal sentences, Aristotle's work was an ambiguous guidebook. The remarks on the structure of the premises are scattered and even if it is natural to think that the presupposition of the

mixed moods is a *de re* reading of modally qualified premises, it creates serious difficulties when it is applied to the conversion rules, most of which are unproblematic only if understood as rules for modals *de dicto*.

There are several recent works on Aristotle's modal syllogistic but no generally accepted historical construction which would make it a coherent theory. (For recent attempts of reconstruction, see van Rijen 1989, Patterson 1995, Thom 1996, Nortmann 1996.) Robert Kilwardby and Albert the Great thought that Aristotle's modal syllogistic was a consistent theory and that the difficulties of understanding some parts disappear when certain philosophical presuppositions are explicated. Instead of employing the *de dicto/de re* distinction they suggested that the notion of necessity in syllogistic premises refers to the Aristotelian *per se* necessity of an essential predication and they also applied many *ad hoc* restrictions pertaining to the notion of contingency in order to give a uniform reading of Aristotelian moods and conversion rules. This approach, which shows similarities to some modern reconstructions of Aristotle's theory, was partially influenced by Averroes's works. While Kilwardby's interpretation of modal statements and modal syllogisms was influential in the thirteenth century, in the early fourteenth century it gave way to a quite different theory (Lagerlund 1999).

The principles of propositional modal logic were generally expressed as follows: if the antecedent of a valid consequence is possible/necessary, the consequent is possible/necessary (Abelard, *Dialectica* 202.6-8). A great deal of Abelard's logical works consisted of discussions of topics, consequences and conditionals. Like Boethius, Abelard thought that true conditionals express necessary conceptual connections between the antecedents and the consequents. Some twelfth century masters regarded the principle that the antecedent is not true without the consequent as a sufficient condition for the truth of a conditional and accepted the so-called paradoxes of implication (Martin 1987). The question of the nature of conditionals and consequences remained a popular theme in medieval logic (Broadie 1993).

Fourteenth Century Discussions

John Duns Scotus's modal theory can be regarded as the first systematic exposition of the new intensional theory of modality, some elements of which were put forward in the twelfth century. In criticizing Henry of Ghent's theory of theological modalities, Scotus sketched the famous and sometimes misunderstood model of ‘divine psychology’ in which certain relations between theological, metaphysical, and modal notions are defined. According to Scotus, we can suppose that everything which can be understood eternally receives intelligible being (*esse intelligibile*) in the intellect of God. Because the intelligible being comprises the individual concept of each thing that can be known, all thinkable realizable individuals receive possible being (*esse possibile*) as the intentional correlates of divine power and choice. The possibilities are thought of as partitioned into classes on the basis of relations of compossibility. Impossibility means incompossibility between possible properties or states of affairs. One of the compossible sets into which the possibilities are partitioned is chosen by divine will to be actualized through divine power (*Ord*. I.43; other relevant texts are *Ord*. I.36 and *Lect*. I.39). Scotus wants to make it clear that, contrary to what Henry of Ghent did, one should not think that the domain of possibility is posterior to God's power. An infinite power can realize whatever is realizable, and it can be

decided which things are realizable without any reference to that power. When Scotus says that God produces things in intelligible being, he means that they are given an ontological status, weaker than existence, as intentional correlates of divine thought. Although God's intellect in this sense eternally produces its objects, it does not create them by choice. God's infinite intellect comprehends all that can be thought without contradiction and understands them necessarily and not freely. The intentional actuality of the domain of possibility in God's mind is caused by divine intellect, but possibilities and impossibilities themselves are what they are independently of whether anything exists. They would remain the a priori conditions of being and thinking even if there were no God, though they would then not have any kind of existence. Scotus thus gave up the view of Thomas Aquinas, Bonaventura, Henry of Ghent and many other thirteenth century theologians that absolute possibilities have an ontological foundation in God's essence. He thought that logical possibilities must be regarded as non-existing preconditions of any beings and their acts. Scotus heavily criticized extensional modal theories in which the actualization at some moment of time was explicitly or implicitly used as the criterion of the genuineness of possibility. He redefined a contingent event as follows: ‘I do not call something contingent because it is not always or necessarily the case, but because its opposite could be actual at the very moment when it occurs’ (*Ord.* I, *d.* 2, *p.* 1, *q.* 1-2, n. 86). The criterion of what is possible is that we can imagine it taking place without contradiction in at least one alternative state of affairs. This is what ‘logical possibility’ means. The domain of possibility as such consists of all thinkable individuals, their properties, and their mutual relations. Because many possibilities are mutually exclusive, this domain must be structured into sets on the basis of compossibility relations. Scotus's theory can be characterized as an intuitive predecessor of possible worlds semantics, though he did not use the term ‘possible world’ in a technical sense. Scotus took it for granted that the same individual can occur in alternative states of affairs. In this respect his theory of possible individuals was different from Leibniz's view that individuals are world-bound. (For Scotus's modal theory, see Knuuttila 1993, 1996, Vos et al. 1994, Lewis 1996, Marrone 1996. Normore 1996 argues for a revised version of the traditional interpretation that modalities are primarily dependent on God.)

Scotus's model theoretical approach to modalities brought some new themes into philosophical discussion. One of these was the idea of the domain of possibility as a non-existent objective precondition of all being and thinking. This was well known in the seventeenth century as well through Suárez's works (Honnefelder 1990). In his discussion of eternal truths, Descartes criticized the classical view of the ontological foundation of modality as well as the Scotist theory of modality and conceivability. He seems to have thought that the domain of conceivability is freely set by God and that it could therefore be different from what it is. (There are different views of Descartes's theory and its connections to late medieval views; see Alanen and Knuuttila 1988, Alanen 1990, Normore 1991.)

Another influential idea was the new distinction between logical and natural necessities and possibilities. In Scotus's theory, logically necessary attributes and relations are attached to things in all those sets of compossibilities in which they occur. Against this background one could ask which of the natural invariances treated as necessities in earlier natural philosophy were necessary in this strong sense of necessity, and which of them were merely empirical generalizations without being logically necessary. The distinction between logical and natural necessity is crucial to the works of William Ockham and John Buridan.

One important branch of medieval logic developed in treatises called *De obligationibus* dealt, roughly speaking, with how an increasing set of true and false propositions might remain coherent. According to the thirteenth century rules, false present tense statements could be accepted only if they were taken to refer to a moment of time different from the actual one. Scotus deleted this rule, based on the Aristotelian axiom of the necessity of the present, and later theories accepted the Scotist revision. In this new form, obligations logic could be regarded as a theory of how to describe logically possible states of affairs and their mutual relationships. These discussions influenced the philosophical theory of counterfactual conditionals (Yrjönsuuri 1994.)

With the new modal semantics, William Ockham, John Buridan and some other fourteenth century authors could formulate the principles of modal logic much more completely and satisfactorily than did their predecessors. Questions of modal logic were discussed separately with respect to modal propositions *de dicto* and *de re*; modal propositions *de re* were further divided into two groups depending on whether the subject terms refer to actual or possible beings. It was thought that logicians should also analyse the relationships between these readings and, furthermore, the consequences having various types of modal sentences as their parts. Richard of Campsall played an interesting role in the development of medieval modal syllogistics. He introduced the habit of treating the *de dicto* and *de re* moods separately, but he was also dependent on Kilwardby's interpretation. The new modal logic of William Ockham, John Buridan and Pseudo-Scotus was among the most remarkable achievements of medieval logic. In its light Aristotle's modal syllogistic was regarded as a fragmentary theory in which the distinctions between different types of fine structures were not explicated. These authors did not try to reconstruct it into a uniform system; they believed, like some modern commentators, that such a reconstruction is not possible (Lagerlund 1999). Buridan's modal logic was dominant in late medieval times. It was embraced by Marsilius of Inghen, Albert of Saxony, and Jodocus Trutfetter. (For the later influence of medieval modal theories, see Coombs 1990, Roncaglia 1996.) The rise of the new modal logic was accompanied by theories of epistemic logic (Boh 1993) and deontic logic (Knuuttila 1993) which also belong among the remarkable achievements of late medieval philosophy.

John Buridan

Although he was one of the most famous and influential philosophers of the later Middle Ages, John Buridan is today among the least well known. He spent his entire career as a master in the arts faculty at the University of Paris, lecturing on logic and the works of Aristotle, and producing many commentaries and independent treatises on logic, metaphysics, natural philosophy, and ethics. His logic textbook, the *Summulae de dialectica* (Compendium of Dialectic), is a work of astonishing breadth and originality which redeems the older medieval tradition of Aristotelian logic using the newer, terminist logic of ‘moderns’ such as Peter of Spain and William of Ockham. Buridan applied these analytical techniques so successfully in his metaphysics, physics, and ethics that, for many of his successors, they came to be identified with the very method of philosophy, understood as a *secular* practice.

1. Life

John Buridan was born sometime before 1300 at or near the town of Béthune in Picardy, France. He was educated in Paris, first at the Collège Lemoine, where he was awarded a benefice or stipend for needy students, and then at the University of Paris, where he received his Master of Arts degree and formal license to teach by the mid-1320s. He enjoyed a long and illustrious career as an arts master at Paris, serving twice (in 1328 and 1340) as university rector and supporting himself with numerous benefices. He last appears alive and well in a document of 1358, which mentions him adjudicating a territorial dispute between the English and Picard nations (the Parisian student body at the time was organized

according to one's place of origin). He must have died shortly thereafter because in 1361, one of his benefices was awarded to another person.[1]

Such is the historical record -- a handful of relatively minor details.[2] Buridan's fame as a teacher and philosopher, however, quickly turned his life into the stuff of legend. There are stories that he met his end when the King of France had him thrown into the Seine River in a sack because of a scandalous affair with the Queen, that he went on to found the University of Vienna after being expelled from Paris for his nominalist teachings, and even that he hit the future Pope Clement VI over the head with a shoe while competing for the affections of the wife of a German shoemaker (the blow apparently caused the prodigious memory for which Clement became known). But none of these legends can be independently verified, and most are inconsistent with what we do know about him.[3] Nevertheless, they illustrate what the French scholar Edmond Faral called the "*bruits de ville*" or 'buzz' surrounding Buridan's name in Parisian circles, which continued for some time after his death.[4]

Buridan's academic career was unusual in two respects, both of which help to explain his philosophy. First, he spent his entire career in the faculty of arts, without ever moving on to study for a doctoral degree in one of the higher faculties of law, medicine, or theology, which would have been the more typical academic career path of the period. Most of the figures we think of as medieval philosophers were trained as theologians, including Thomas Aquinas, Duns Scotus, and even William of Ockham (although he did not finish his degree). Since university statutes forbade arts masters from teaching or writing about theology, Buridan produced no theological works and no commentary on the *Sentences* of Peter Lombard, one of the principal genres of philosophical writing in the 14th century. Why did he remain in the faculty of arts? It is unlikely that someone of his talents would have spent his whole life teaching without being recognized. Nor can the reason be lack of means, for despite his impoverished background he was from the moment he arrived in Paris a magnet for bursaries and stipends, and is even named in a document of 1349 as being among those masters capable of supporting themselves without financial assistance from the University. The only plausible answer is that he chose to remain one of the 'artists [*artistae*]'. We can only speculate about his reasons, but it has been suggested that Buridan was committed to a vision of philosophy as a secular enterprise beginning from what is evident to the senses and intellect, as opposed to theology, which begins from non-evident truths revealed in scripture and doctrine.[5]

Buridan is also different in that he remained for his entire life a secular cleric rather than joining a religious order such as the Dominicans or Franciscans. A papal letter of 1329 refers to him as simply, "*clericus Atrebatensis diocoesis, magister in artibus* [a cleric from the Diocese of Arras and Master of Arts]".[6] By contrast, the best-known names of the period all had religious and intellectual affiliations beyond the university: Thomas Aquinas (Dominican), Duns Scotus (Franciscan), William of Ockham (Franciscan), Gregory of Rimini (Augustinian), to name a few. Among other things, this freed Buridan from the obligation to enter into the ongoing doctrinal disputes that arose between religious orders, or between an order and the church hierarchy -- such as the dispute between the papacy and the Franciscans over apostolic poverty. Thus, whereas Ockham spent his entire later career on various political crusades, away from philosophy, and was finally excommunicated for his troubles, Buridan was bound only by the

intellectual and pedagogical traditions of his university. His confessional independence also meant that he could help himself to philosophical insights from a variety of sources. This emerges in the sometimes eclectic character of his work, as we shall see below.

2. Writings

Most of Buridan's works are in the form of commentaries on Aristotle. He wrote both *expositiones* (expositions), or literal commentaries which feature detailed, line-by-line explanations of the meaning of Aristotle's remarks, and *quaestiones* (questions), or longer, critical studies of the philosophical issues raised by them, usually centered on a specific lemma from the text. Both genres originated in the classroom, a fact that becomes clear in the number of references to student queries and student concerns which survive in the written versions. Buridan often lectured more than once on the same text over the course of his career, with the result that we sometimes have different written versions of his commentary on the same work. For example, there are three versions of his *Quaestiones* on Aristotle's *De anima*, the last of which identifies itself as the "third or final lecture [*tertia sive ultima lectura*]". Where there are multiple versions of the same commentary, their relationship is generally one of increasing length and sophistication over time.

Buridan commented on virtually all of the major works of Aristotle. In addition to the entire *Organon*, there are commentaries on Aristotle's *Physics, On the Heavens, On Generation and Corruption, De Anima*, *Parva Naturalia*, *Metaphysics*, *Nicomachean Ethics*, and *Rhetoric*.[7] He also wrote a number of shorter, independent treatises on current philosophical issues, such as the *Tractatus de relationibus* [Treatise on Relations], *Tractatus de universalibus* [Treatise on Universals], *Tractatus de consequentiis* [Treatise on Consequences], and *Quaestio de puncto* [Question on <the Nature of> Points]. He was a very prolific author.

But Buridan's masterwork is the *Summulae de dialectica* [Compendium of Dialectic], a comprehensive logic textbook that started out as a commentary on the *Summulae logicales* or logical compendium of the 13th-century dialectician Peter of Spain,[8] but soon evolved into an independent work of astonishing breadth and originality. In it, Buridan redeems the older medieval tradition of Aristotelian logic through the *via moderna* [modern way] -- the newer, terminist logic that had gradually replaced it. Because the work was accessible to master and student alike, it became extremely popular at Paris and in the newly founded universities of Heidelberg, Prague, and Vienna.

Buridan's other works were almost as widely read as the *Summulae*. Handwritten copies and early printed editions were carried by his students and followers throughout Europe, where they were often used as primary texts in university courses on logic and Aristotelian philosophy. The *via Buridani* continued to shape European thought well into the Renaissance.

Like other medieval philosophers, Buridan has not been fully appreciated because of the lack of modern editions and translations of his work (see bibliography). The situation has improved recently with the

appearance of Gyula Klima's mammoth translation of the entire *Summulae* from the (now almost complete) Latin critical edition of the text. But knowledge of Latin and the ability to read medieval manuscripts are still essential if one wishes to study Buridan's thought first-hand.

3. Language

In the medieval university, arts masters provided students with their basic education in grammar, logic or dialectic, and Aristotelian philosophy, subjects which together embodied the medieval conceptions of literacy and wisdom. What they taught was the language of rational inquiry, without which further study in law, medicine, or theology would have been impossible. Students were required to learn, in ascending order, the exposition and interpretation of authoritative texts (grammar), the structure and modes of reasoning in conventional discourse (logic), and finally, the analysis and systematic disclosure of the order of nature (Aristotelian philosophy). Although he did not write grammatical treatises,[9] Buridan asserts in the very first section of the *Summulae* that "positive grammar [*grammatica positiva*] has to be learned first, by means of which the master is able to communicate with the disciple, whether it be in Latin, French, Greek, or Hebrew, or whatever else" (S 1.1.1: 6). The disciple's knowledge of logic and Aristotelian philosophy is built upon this grammatical foundation.

The importance of language in Buridan's philosophy emerges on many levels, all of which are driven by pedagogy. In logic, grammatical rules are explicitly subsumed as necessary conditions of the science (*scientia*) of logic, so that although the logician's notion of truth and the grammarian's notion of congruence are separable in theory, in practice the complete significance of a piece of discourse cannot be determined without both. Context is crucial to interpretation:

> We should also note that some might ask whether it is the composite or the divided sense that is properly expressed by 'Every man or (a) donkey runs', that is to say, whether only the term 'man' or the whole subject is distributed. And I say that we have to respond differently, in accordance with the different manners of speaking and writing. For if immediately after 'man' there is a sign of division, namely, a pause or a period, then the proposition will be called divided, and only 'man' will be distributed, but if not, then it will be called 'composite', and the whole subject will be distributed. (S 4.2.6: 250; cf. S 9.4, 15th sophism: 912-13).

Accordingly, logic is not about some conceptually ideal or canonical language but the practical art of interpreting discourse:

> an utterance [*vox*] does not have any proper import [*virtus propria*] in signifying and suppositing, except from ourselves. So by an agreement of the disputing parties, as in obligational disputes, we can impose on it a new signification and not use it according to its common signification. We can also speak figuratively [*transsumptive*] and ironically, according to a different signification. But we call a locution 'proper' when we use it according to the signification commonly and principally given to it, and we call a locution

> ‘improper’ when we use it otherwise, although we can legitimately use it otherwise. So it is absurd to say that a proposition of an author is false, absolutely speaking, if he puts it forth incorporating an improper locution, according to which it is true. Instead, we ought to say that it is true, since it is enunciated according to the sense in which it is true … So it absolutely seems to me that wherever it is evident that an author puts forward a proposition in a true sense, although not as a proper locution, then to deny that proposition without qualification would be cantankerous and insolent [*dyscolum et protervum*]. But to avoid error, it should be properly pointed out that the proposition is not true in the proper sense, or by virtue of its proper meaning, and then it has to be shown in which sense it is true. (S 4.3.2: 256; cf. QIP 5: 144-145, ll. 800-829)

In Buridan's view, the logician cannot expound the meaning of a proposition without carefully attending to its internal features, i.e., the sense of the particular locutions incorporated in it, as well as to its external features, i.e., the discourse conditions which surround it.

This willingness to take human language as it is found, with all of its ambiguities and rough edges, marks an important difference between Buridan and Ockham, the 14th-century philosopher with whom he is most often compared. Both authors make the traditional assumption that propositions, be they spoken, written, or mental, are the bearers of truth and falsity. Ockham, however, tends to see mental propositions as logically ideal or, in modern parlance, ‘canonical’.[10] The problem with spoken and written propositions is that because they depend on the meaning conventions of fallible users, they fail to be universal and logically perspicuous. But these shortcomings can be filtered out metalinguistically once we realize that the meanings of their constituent terms depend on their corresponding mental concepts, which naturally signify the same for everyone. So in Ockham's logic, the semantic relation between these concepts and what they signify outside the mind is of paramount concern; spoken and written terms have semantic properties too, of course, but in an entirely derivative way. By contrast, Buridan never privileges conceptual discourse or suggests that the logician might use it to systematically reform spoken or written language. He holds that spoken and written utterances -- sometimes he uses the term ‘utterance [*vox*]’ where Ockham has ‘term [*terminus*]’ -- signify concepts primarily: “the capability of speaking was given to us in order that we could signify our concepts to others and also the capacity of hearing was given to us in order that the concepts of speakers could be signified to us” (S 4.1.2: 222). Accordingly, “utterances are imposed to signify things only through the mediation of the concepts by which those things are conceived” (QC 1: 4, ll. 45-6). Concepts are just the medium of signification for Buridan, the cognitive or psychological aspect of the signification of a word.

This difference helps to explain why Buridan uses paradoxes of self-reference to test the functionality of his logic, whereas Ockham avoids them by claiming that a term -- or at least a term in those circumstances -- cannot refer to itself.[11] Buridan takes seriously the fact that people can and do utter self-referential propositions, and thinks the logician should say what is going on when they do. This is really a difference of perspective. As Joël Biard has pointed out, we can divide medieval logicians into those who try to restrict the possibilities of human discourse in the direction of what is logically ideal, and those who are willing to accept a proposition because it is grammatical and because the person who

utters it intends to signify something by it. Ockham, William of Sherwood, and Walter Burley belong to the former group; Buridan and Thomas Bradwardine to the latter.[12] It also explains why Buridan tells us that it is not possible to analyze contradictory propositions unless they "have the same subject and predicate in utterance and also in intention" (S 9.7, 2nd sophism: 943), and his reminding us that, when testing a proposition for contradictoriness, "it is [sometimes] necessary to add other utterances when contradicting it…. For one should primarily attend to the intention, for we use words only to express the intention" (S 9.8, 11th sophism: 979). The logician must above all be a skilled interpreter of human discourse.

For Buridan, linguistic confusion is the source of many of the traditional problems of metaphysics and natural philosophy. His approach is broadly nominalistic, but Buridan's nominalism is more of a parsimonious way of doing philosophy than a doctrine about universals. For example, when a cause is understood as being actual rather than merely potential, does our conception of it *qua* cause change in any way? Aristotle leaves this ambiguous in *Metaphysics* V.2, but some medieval philosophers thought it necessary to posit an additional state of affairs to explain the dynamic aspect of causality, i.e., the fact that a contingent state of affairs needs to be brought about by some agent. Thus, if we think of God as the cause of Socrates, there must be something else, God's-being-the-cause-of-Socrates (*deum esse causam Sortis*), distinct from both God and Socrates, to account for his existence. This 'something else' then becomes not only what is signified by the proposition 'God is the cause of Socrates' (*complexe significabile*), but also the proper object of our knowledge that God is the cause of Socrates. Buridan replies by arguing that philosophers who think this way do not know how to interpret human language. They take everything too literally. But we should not be misled by what a proposition literally says, or seems to say, into thinking that there must be some new kind of entity corresponding to God's being the cause of Socrates, especially since such reifying moves do not help us to understand what is happening when a cause acts (QM V.7-8: 30va-33ra).

The same sensitivity to questions of interpretation is evident in his treatment of propositions in natural philosophy, where he argues that we can meaningfully use propositions containing terms such as 'infinite [*infinitum*]' and 'point [*punctum*]' to express actual states of affairs without committing ourselves to the existence of infinite magnitudes or indivisible points. The key is to realize that propositions do not always wear their meanings on their sleeves. Their component terms can be differently construed (e.g., categorematically or syncategorematically), and can even perform different modal functions, which, depending on how the proposition is read (e.g., in a composite or divided sense) can change its truth conditions.[13] There will be ambiguities, of course, but Buridan is steadfast in his assumption that a rational person will always be able to sort them out, given the right dialectical tools.

4. Logic

Following Aristotle and Porphyry, Buridan's logic is based on two distinct, but complementary, conceptions of its purpose: theoretical or pedagogical (*logica docens*) and practical (*logica utens*).[14] The former, he says, is so called because "it teaches [*docet*] us how, and from what [materials], arguments should be constructed, whether those arguments be demonstrative, dialectical, or of some

other kind". The latter takes its name from the fact that "it uses [*utitur*] arguments in order to prove whether some conclusion is evident, regardless of the subject matter of the conclusion" (QIP 1: 126-7, ll.176-80). But since the teaching of logic is ordained to its use, Buridan holds that logic is ultimately a practical rather than a speculative discipline.

Historians of logic usually classify Buridan as one of the terminists or 'moderns', a diverse group of 13th and 14th-century logicians who regarded the semantic properties of terms (literally, the 'ends [*termini*]', or subjects and predicates, of propositions) as the primary unit of logical analysis. As we saw above, in addition to commenting on Aristotle's *Organon*, he wrote a logical compendium, the *Summulae de dialectica*, ostensibly as a commentary on Peter of Spain's *Summulae logicales*, an influential terminist textbook written a century earlier. But Buridan's *Summulae* was essentially a new work, more that ten times longer than the original and featuring many new and completely rewritten sections. Buridan moves his students and readers through an orderly progression of teachings, beginning with propositions (Treatise I), shifting down to the signification and referential function of their component terms (II-IV), then back up to terms and propositions insofar as they figure in more complex patterns of reasoning: syllogisms (V), topics (VI), fallacies (VII), and finally, demonstrations (VIII). The work concludes with a kind of exercise book on paradoxical and otherwise puzzling propositions, showing how they can be resolved using the techniques of the previous eight treatises.

No encyclopedia article can do justice to the richness and variety of Buridan's logic, but there are several moments from the text that illustrate how he practiced the art of dialectic.

First, Buridan did much to streamline and better articulate the methods of terminist logic. The most important analytical tool in the *Summulae* is the doctrine of *suppositio* [supposition], which had been a feature of terminist logic for several generations by the time Buridan arrived in Paris. Terms were thought to possess two general semantic properties: signification, which refers to what a term 'makes known' in the mind of the person who sees it or hears it or conceives of it, whether mediately or immediately (thus, the written term 'Socrates' brings to mind the concept of Socrates, which in turn signifies the actual person); and supposition, which refers to the capacity of certain substantive terms to stand for or 'pick out' something in a particular context, such as in a proposition. Supposition roughly corresponds to what we would call the theory of reference.[15] Traditional accounts divided supposition into proper supposition, where a term is used with its typical or standard meaning, and improper supposition, where a term is used in some metaphorical or figurative sense. Most logicians went on to distinguish three kinds of proper supposition: personal, where a term stands for what it signifies (e.g., 'Socrates' in 'Socrates is a man'); material, where it stands for itself (e.g., 'man' in 'Man has three letters'); and simple, where it stands for a common nature or concept (e.g., 'man' in 'Man is a species'). Simple supposition appears to have been a vestige of early terminist logic,[16] whose realist practitioners needed to distinguish between referring to a universal thing and referring to a particular thing. But by the 14th century, the whole notion of universals had become more controversial, and nominalist logicians in particular were not about to accept any special device for referring to them through common terms such as 'man'. So simple supposition was readapted to model reference to common concepts or intentions. Thus, Ockham holds that a term exhibits simple supposition when it supposits "for a concept in the mind

[*pro conceptu mentis*]," and is not being used significatively.[17] What united Ockham and his terminist predecessors was their realization that if the proposition 'Man is a species' is to be true, then the term 'man' cannot supposit personally for any of the individual men it ultimately signifies, since it cannot be said of any of them that he is a species (Socrates is a man, not a species). Accordingly, the reference of 'man' must be to a common nature or concept.

But Buridan contends that there are only two ways a term can stand for something in a proposition, personally and materially:

> Of the first [section on the divisions of supposition], we should realize that some people have posited also a third member, which they call 'simple supposition'. For they [e.g., Peter of Spain] held that universal natures are distinct from the singulars outside of the soul. And so they said that a term supposits personally when it supposits for the singulars themselves, that it supposits simply when it supposits for that material nature, and materially when it supposits for itself. But I hold that Aristotle correctly refuted that opinion in the seventh book of the *Metaphysics* [VII.3.1038b1-1039a23] and so this kind of supposition has to be eliminated, at least according to this interpretation. In another manner, others [e.g., Ockham] call supposition 'simple' when an utterance supposits for the concept according to which it is imposed and material when it supposits for itself or another similar to itself. And this can be permitted, but I do not care [about this usage], for I call both 'material supposition'. (S 4.3.2: 253)

Buridan sees that it is misleading to assign a special logical sense to terms being used to refer to themselves or to the concepts they express, as if this were any different from figurative or metaphorical uses, since only terms that refer to things existing *per se* are being used in their proper sense. Thus, terms can stand either for the things they ordinarily signify, in which case they supposit personally, or for something else, in which case they supposit materially. Material supposition applies whenever a term is used in some way that departs from the meaning imposed upon it by the linguistic community:

> an utterance does not have any proper import [*virtus propria*] in signifying and suppositing, except from ourselves. So by an agreement of the disputing parties, as in obligational disputes, we can impose on it a new signification, and not use it according to its common signification. We can also speak figuratively [*transsumptive*] and ironically, according to a different signification. But we call a locution 'proper' when we use it according to the signification properly and principally given to it, and we call a locution 'improper' when we use it otherwise, although we legitimately can use it otherwise. So it is absurd to say that a proposition of an author is false, absolutely speaking, if he puts it forth incorporating an improper locution, according to which it is true. Instead, we ought to say that it is true, since it is enunciated according to the sense in which it is true. (S 4.3.2: 256)

Notice that the default interpretation of a term is its proper sense, defined as "the signification properly

and principally given to it". The proper signification of a term must be based on the fact that "utterances were primarily and principally imposed to signify so as to stand for their ultimate *significata*, and not for themselves" (S 4.3.2: 256);[18] that is to say, just as concepts (at least in the first instance) naturally signify those extra-mental things which just as naturally give rise to them, so spoken and written terms (at least in the first instance) are imposed to signify, via their corresponding concepts, the same ultimate *significata*.[19] For Buridan, this capacity is part of our nature as cognitive creatures. It is why he insists that determining the nature of concepts pertains not to logic but to psychology or metaphysics, speculative sciences whose conclusions cannot be otherwise (QDI I.3:6, ll. 4-10).[20] So even if we say that the proposition, 'Man is a species' is true insofar as it is put forward in the context of Aristotle's *Categories*, it is not literally true, or true according to "the signification properly and principally given to it", because of no *per se* existing man is it true to say that he is a species. What happens is that when we work on the *Categories*, we follow Aristotle's lead and depart from conventional usage in such a way that the term 'man' supposits not for individual men but for the universal concept according to which it was imposed to signify, in which case the proposition is true because "species and genera are universals according to predication" (S 4.3.2: 254). So it can be true that man is a species without it being *literally* true that man is a species.

The second way in which Buridan changed the dialectical landscape was to extend the range of traditional logic. There are numerous examples of this, not all of them uncontroversial because it is often hard to tell what Buridan intended to achieve by a given innovation (this goes for other medieval logicians as well).[21] But a fairly uncontroversial example can be found in his use of supposition to examine the structure of certain complex terms that would remain unanalyzed on the traditional account of syllogistic inferences. Of particular importance here is the doctrine of ampliation. Thus, although the syllogism, 'Nothing dead is an animal, some man is dead; therefore, some man is not an animal', is an acceptable fourth-mode syllogism of the first figure (*Ferio*), Buridan denies that the consequence is "formally valid". The reason is that in this syllogism, 'man' is an ampliative term, and "from an ampliated nondistributed term the same term does not follow nonampliated" that is, "in the minor proposition the term 'man' was ampliated to past [things], whereas in the conclusion it was not ampliated," making the premises true but the conclusion false (S 5.3.2: 326; cf. QAnPr I.14). Similarly, terms referring to the divine persons sometimes generate counterexamples to the traditionally accepted modes. Thus, "the following syllogism in *Barbara* is invalid: 'Every God is the son, every divine Father is God; therefore every divine Father is the Son", for the transitivity of identity fails in cases "where the most simple unity is a trinity of really distinct persons" (S 5.3.2: 327). Buridan also urges the reader to be wary of modal contexts introduced by verbs of knowing and believing because "the verb 'know' ampliates the subject to supposit not only for present things, but also for future and past ones". This means that without suitable qualification, "although I know that every man is an animal, nevertheless, it does not follow that every man is known by me to be an animal; for then it would follow that every man, whether alive or dead or yet to be born, would be known by me to be an animal, which is false" (S 5.6.8: 348). What is noteworthy in these and other examples is Buridan's use of the doctrine of supposition to extend the range of 'truth-makers' for modal inferences, e.g., in his assumption that "the presence of a modal copula -- *any* modal copula -- in a proposition ampliates the subject to stand for not only the actual things but also the possible things that fall under that term".[22] Because it makes merely possible objects relevant to the evaluation of modal inferences, ampliation can be seen as a kind of Buridanian equivalent

of possible worlds semantics, though it would be a mistake to regard it as a remarkable anticipation of that 20th-century theory. Buridan's remarks on its theoretical significance are few,[23] and, despite the degree of technical sophistication involved, he probably did not see it as a radical innovation. He probably understood it as part of his ongoing effort to make existing schemes for checking inferences more practicable.

Third, and finally, Buridan made major contributions to certain forms of logical inquiry that originated in the medieval period. Most modern logicians know of his solutions to alethic paradoxes such as the Liar, which are addressed in the eighth and final chapter of ninth treatise of the *Summulae*, which belongs to the medieval literature of *sophismata* or *insolubilia*.[24] The 7th sophism Buridan considers is ‘Every proposition is false’. The case posits “that all true propositions are annihilated while the false ones remain [in existence], and then Socrates propounds only this [proposition]: ‘Every proposition is false’” (S 9.8, 7th sophism: 965). The question is then asked whether Socrates's proposition is true or false. The arguments on each side of the question illustrate the difficulties one faces if ‘true’ and ‘false’ are interpreted strictly. The argument that it is false assumes that “it is impossible for the same proposition to be true and false when propounded in the same language and understood in the same way by everyone hearing it”, and proceeds to argue that the sophism is false because any proposition which entails its own contradictory is impossible, and therefore false. The opposite side begins by focusing on the logical form of the sophism as a universal affirmative that has no counter-instance in the case at hand, which stated that all true propositions have been annihilated with only the false ones remaining. Second, the sophism must be true because the subject and predicate terms supposit for the same things: if every proposition is false, then each and every propositional significate of the term ‘every proposition’ must be false, as it indeed is, according to the case. Finally, the sophism must be true because “it signifies only that every proposition is false; and this is how things are [*ita est*]”, according to the case (S 9.8, 7th sophism: 965).

Buridan writes as if this particular sophism enjoyed some notoriety among logic teachers at Paris, although all but one of the alternative solutions he mentions were discussed and criticized from the very beginning of the *insolubilia* literature. These involve various *ad hoc* proposals that either build new assumptions into the case or else make up new rules about how the terms of the sophism are to be interpreted.[25] Into the first category falls a solution known as the ‘*transcasus*’, which involves the bizarre suggestion that the time Socrates utters his proposition and the time referred to by the verb of the proposition are not the same. This would allow us to say that if there are no true propositions during the first hour of a certain day, Socrates could utter his proposition at the end of this hour and it would be true, where he is understood as referring “not to the time at which he speaks but to the time of that first hour”. But this is of no help if we stick to the case and assume that the times are the same. Alternatively, in a solution advocated by the ‘*restringentes* [restrictors]’ -- so-called because they avoided self-reference by restricting what a term can supposit for -- we could make the proposition non-reflexive by stipulating that “terms that are apt to supposit for propositions are not put in propositions to supposit for the propositions in which they are put, but for others”. But Buridan rightly rejects this second strategy as failing to take seriously our conventional understanding of terms, for when one uses the term ‘proposition’, he says, “one understands indifferently all propositions, indeed, present, past, and future ones, his own as well as those of another person”. A moment's reflection should make it obvious that

“this solution is worth nothing: for what one understands, of that he can speak [*quod aliquis intelligit, de hoc potest loqui*]” (S 9.8, 7th sophism: 966).[26]

Buridan's quick answer to the sophism is that Socrates's proposition is false in the case at hand. But before moving on to his final answer, he first discusses a solution described as being held by some people, including himself.[27] This is that there is another condition, in addition to the requirement that its terms stand for the same thing or things, which a proposition must meet if it is to be true. A proposition must also signify or assert itself to be true (S 9.8, 7th sophism: 967).[28] In her detailed analysis of this sophism, Fabienne Pironet has shown that the text in which Buridan defends this earlier view is his question commentary on Aristotle's *Posterior Analytics*, where it is expressed in terms of the traditional formula that “howsoever [a proposition] signifies, so it is [*qualitercumque significat, ita est*]” (QAnPo I.10).[29] Now Buridan holds that all propositions satisfy this condition trivially: “every proposition by its form signifies or asserts itself to be true” (S 9.8, 7th sophism: 967). The problem with self-referential paradoxes is that they also seem to signify that they are false. Thus, although the proposition ‘I say what is false [*ego dico falsum*]’ “signifies itself to be true in some fashion, nevertheless this is not so entirely, or howsoever it signifies [*licet aliqualiter sic significat, non tamen totaliter vel qualitercumque ita est*]. Therefore it is false” (QAnPo I.10).

Unfortunately, this looks no less *ad hoc* than the *transcasus* and restriction solutions he has just criticized. Why shouldn't other propositions, besides the paradoxical ones, be able to signify that they are false? Buridan does not say in his commentary on the *Posterior Analytics*, and in the *Summulae* he rejects his earlier view for the rather different reason that it is false “that every proposition signifies or asserts itself to be true” (S 9.8, 7th sophism: 968). His argument is not exactly clear, but the problem appears to be semantic: he cannot find an interpretation of the phrase ‘itself to be true [*se esse veram*]’ in the supplementary condition that will permit it to function as a general principle. Consider the proposition ‘A man is an animal [*homo est animal*]’. If we understand it materially, i.e., as standing for a proposition, then it will signify ‘The proposition “A man is an animal” is true’, which is false because it refers to second intentions (concepts or signs by means of which we conceive of other concepts or signs as such), and the original proposition refers to things (human beings and animals), not concepts. But what if we say that a proposition signifies itself to be true if it is taken significatively for the things or first intentions, rather than materially? This will not work either, argues Buridan, because then the affirmative proposition ‘A man is a donkey [*homo est asinus*]’ would signify that a man is a donkey, which is false because the subject term ‘man’ does not supposit for anything (no human beings are donkeys).[30] Accordingly, we cannot base our solution to self-referential paradoxes on the idea that every proposition signifies or asserts itself to be true.[31]

The solution Buridan finally settles on receives the somewhat tepid endorsement of being “closer to the truth” than the previous solution -- a reflection, perhaps, of his awareness of the imperfectability of any formal system that stays close to the fact of human language. Here, the idea that a proposition formally signifies itself to be true is replaced by the notion of implication from the doctrine of consequences. “Every proposition,” he says, “virtually implies another proposition in which the predicate ‘true’ is affirmed of the subject that supposits for [the original proposition]” (S 9.8, 7th sophism: 969).[32] Unlike

the old solution, in which the second proposition is signified by the first and hence part of its meaning, the new solution assumes only that the second proposition follows logically from the first, so that its meaning can be expounded separately. In this way, for the truth of any proposition P, it is required not only (1) that the subject and predicate terms of P stand for the same thing or things,[33] but also (2) that P implies another proposition, ‘P is true’, which must also be true. Otherwise, we would have a true antecedent and a false consequent, violating Buridan's fifth theorem regarding assertoric consequences, which states, “it is impossible for what is false to follow from what is true [*impossibile est ex veris sequi falsum*]” (TC I.8: 34, l. 97). Applying this to the 7th sophism, the constituent terms in the proposition uttered by Socrates -- ‘Every proposition’ and ‘false’ -- stand for the same things, since in the posited case, “all true propositions are annihilated and the false ones remain, and then Socrates propounds only this: ‘Every proposition is false’”. So the first condition is satisfied. But the implied proposition, ‘P is true’ (where P is the name of ‘Every proposition is false’), is false because its constituent terms, ‘Every proposition is false’ and ‘true’, do not stand for the same thing, since *ex hypothesi*, P stands for the antecedent proposition ‘Every proposition is false’, not for things that are true. But this gives us a true antecedent and a false consequent, and so the consequence does not hold. Therefore, the sophism is false.

5. Metaphysics

Buridan's metaphysics is thoroughly informed by his logic. He tries wherever possible to apply the *Summulae*'s analytical techniques to solve problems in speculative philosophy. His approach is critical in that it tends to view traditional questions in metaphysics as based on confusions of logic or language. For the same reason, his solutions are not original in the modern sense of being without precedent, although they have few equals in terms of their elegance and economy of expression. Buridan is a master craftsman of philosophical argumentation.

Like most arts masters in 14th-century Paris, Buridan is careful to dissociate the metaphysical questions he asks as a philosopher from similar questions that might be asked by a theologian. Jurisdictional wrangling forced Parisian masters to be quite clear about how they were approaching a problem,[34] although what we now identify as medieval philosophy was practiced by both sides. As far as Buridan is concerned, much of the confusion over the proper domains of metaphysics and theology stems from Aristotle himself, who identifies three kinds of speculative science: physics, mathematics, and theology.[35] In his question commentary on the *Metaphysics*, he provides the standard medieval interpretation of this passage, reading ‘theology’ as ‘metaphysics’ and differentiating the three sciences in terms of how they treat their respective subjects: whereas the natural philosopher considers things insofar as they are qualified by motion, and the mathematician insofar as they are quantified by number, the metaphysician considers them only insofar as they pertain to the “concept of being [*ad rationem essendi*]” (QM VI.2: 34ra).[36] For the difference between metaphysics and theology, however, we need to go to the very beginning of the commentary, where he offers the following gloss of Aristotle's remarks:

> It should also be noted that [when we ask whether metaphysics is the same as wisdom,] we are not comparing metaphysics to theology, which proceeds from beliefs that are not

> known, because although these beliefs are not known *per se* and most evident, we hold without doubt that theology is the more principal discipline and that it is wisdom most properly speaking. In this question, however, we are merely asking about intellectual habits based on human reason, [i.e.,] those discovered by the process of reasoning, which are deduced from what is evident to us. For it is in this sense that Aristotle calls metaphysics 'theology' and 'the divine science'. Accordingly, metaphysics differs from theology by the fact that although each considers God and those things that pertain to divinity, metaphysics only considers them as regards what can be proved and implied, or inductively inferred, by demonstrative reason. But theology has for its principles articles [of faith], which are believed quite apart from their evidentness, and further, considers whatever can be deduced from articles of this kind. (QM I.2: 4ra-rb)

The difference is that theologians take their principles ('*principia*' = (lit.) 'starting points') from articles of faith rather than, as the philosophers do, from what is evident to the senses and intellect. So it is possible for the same question -- e.g., about the limits of divine omnipotence -- to be raised in both domains, though it will have a more creaturely orientation for the philosopher.[37] Buridan concedes *de jure* place of privilege to theology because of its subject matter, but treats philosophy and theology as *de facto* equivalent in the speculative realm. Metaphysics, or philosophical wisdom, cannot be ordained by theology because its methods, which are rooted in its principles, are different. Philosophy is accordingly not inferior to theology, just different.[38]

With regard to the problem of universals,[39] Buridan does not so much create a new theory as show how our theoretical commitments can be expressed with a minimum of ambiguity and fuss. Like Ockham, he is a nominalist, although this term must be used with caution in later medieval philosophy because of the modern tendency to identify it simply with the denial of real universals. Most 14th-century philosophers were nominalists in this sense because they associated the contrary doctrine with Plato, with whom they were familiar only secondarily as one of the authors thoroughly discredited by Aristotle in Book I of the *Metaphysics*.[40] But medieval nominalism involved much more than rejecting Platonic universals. Its history can be traced to 12th-century disputes over the reading of sacred texts, in which the techniques of logicians such as Abelard were pitted against those of grammarians such as Peter Helias.[41] As these disputes matured, nominalism was gradually absorbed into the teaching of philosophers working in the faculty of arts, so that by Buridan's time, it is better to think of nominalism as a practice, or way of doing philosophy, and not as a piece of doctrine.

When Buridan considers questions such as "whether universals actually exist outside the soul" (TDUI: 137), his remarks are almost always aimed at clarifying the meaning of the term 'universal' with respect to other terms such as 'individual', 'particular', and 'singular'. His rejection of realism is expressed in the claim that universal terms have no ultimate significate, i.e., nothing outside the soul they can 'make known' as such.[42] Hence, an account is needed of what such terms mean. Here, it is almost as if Buridan thinks there is something ill-formed about propositions where the term 'universal' occurs in the subject position, for when confronted with them his first move is always to tell us how the term 'universal' should be understood (QIP 3: 136, ll. 477-488).[43] He argues further that the primary

signification of ‘universal’ is ‘predicable of many’, which makes it a term of second intention, or a term of terms, since only terms are predicable (QIP 3: 135-136; 4: 139; TDUI: 148).[44] The second-intentional status of the term ‘universal’ is also evident in propositions, where it does not signify a ‘what’ but a ‘how’, i.e., how we conceive of something -- in this case how the term so designated is “indifferent to many supposits,” or individuals (TDUI:59).[45] As we saw above, logic is the study of terms such as ‘proposition’ taken materially, signifying actual tokens of the type (QDI I.1: 6). Moving from propositions to arguments, Buridan insists that terms in the premises and conclusions of demonstrative arguments must be taken as standing materially, i.e., for themselves in the particular discourse conditions which surround them, rather than personally, for their extra-mental significates (QIP 1: 128, ll. 223-237). Likewise, the proximate object of scientific knowledge is the actual demonstrated or demonstrable conclusion rather than the state of affairs it signifies, although Buridan is willing to concede that “the terms of those demonstrable conclusions, or even the things signified by those conclusions” might be considered “remote”, or secondary, objects of knowledge (QIP 1: 127,l. 208-209).[46] Careful and systematic analysis is the best antidote for metaphysical perplexity because the trouble usually begins with untutored persons who don’t know what some word or concept means.

It should be noted that Buridan's methods do not always produce parsimonious results. Like Ockham, he has only substances and qualities in his basic ontology, but he is much more willing than Ockham to expand this in the direction of modes or ways of being when confronted with recalcitrant phenomena. Thus, he argues that we must treat the question of *how* something is as distinct from *what* it is if we are to have a coherent understanding of motion, especially since the Ockhamist view is forced to posit an infinite succession of spatial qualities (QM V.9: 32va; QP II.3:1ra-rb; QP IV.11: 77va-78rb).[47] Likewise, in a famous passage, Buridan is driven by his own experience to reject Ockham's explanation of condensation and rarefaction as kinds of locomotion. Why, he asks, does he find himself unable to compress further the air in a bellows which has been stopped up at one end? Not because of its matter, because more matter could exist in a much smaller space; nor because of the substantial form of the air, which would fill a much smaller space once it has cooled; nor even because of the heat it possesses, since more heat could exist in a much smaller space, such as at the end of a red-hot poker. No, the air must have a distinct quantitative form or magnitude preventing it from being moved. Against those who would do away with this distinction, Buridan argues that “a magnitude of this sort has not been posited in vain, for we have been compelled to posit it by arguments that make it seem as useful or even more useful to natural philosophy than [the qualities of] whiteness or blackness” (QP.8: 11vb).[48]

6. Natural Philosophy

Medieval natural philosophy included both the rich commentary tradition on Aristotle's Physics, as well as treatises and commentaries on Aristotle's other writings about the natural world: *On the Heavens*, *On Generation and Corruption*, *De anima*, the short treatises on animate powers known as the ‘*Parva Naturalia*’, and the works on the history, parts, and generation of animals. Buridan wrote commentaries on nearly all of these texts. Like his contemporaries, he understood the speculative sub-disciplines of physics as an orderly progression of learning. Thus, a demonstration in psychology was thought to borrow its principles or starting points from physics, the higher science to which it is subordinated, with

its conclusions in turn supplying principles for demonstrations in the more specialized studies of sensation and animal locomotion. The ordering metaphor is never far from Buridan's mind. He remarks to readers of his commentary on Aristotle's *De motibus animalium* that in this book, “we descend to the different species of motion in particular, e.g., to the fact that some animals fly, others swim, and so on” (DMA I: 535)

Besides his contributions to logic, natural philosophy is the field where Buridan has enjoyed some recognition. This is due to the efforts of the pioneering historians of science Pierre Duhem and Anneliese Maier, who saw that Buridan had played a key role in the demise of the Aristotelian view of the cosmos.[49] Buridan's major contribution here was to develop and popularize the theory of impetus, or impressed force, to explain projectile motion. Rejecting the discredited Aristotelian idea of antiperistasis, according to which the tendency of a moving projectile to continue moving is due to a proximate but external moving cause (such as the air surrounding it),[50] he argues that only an internal motive force, transmitted from the mover to the projectile, could explain its continued motion. The theory of impetus probably did not originate with Buridan,[51] but his account differs from the others in that he entertains the possibility that it might not be self-dissipating: “after leaving the arm of the thrower, the projectile would be moved by an impetus given to it by the thrower,” he says, “and would continue to be moved as long as the impetus remained stronger than the resistance, and would be of infinite duration were it not diminished and corrupted by a contrary force resisting it or by something inclining it to a contrary motion” (QM XII.9: 73ra). He also contends that impetus is a variable quality whose force is determined by the speed and quantity of the matter in the subject, so that the acceleration of a falling body can be understood in terms of its gradual accumulation of units of impetus. But despite its revolutionary implications, Buridan did not use the concept of impetus to transform the science of mechanics. He was not, as Duhem argued, a forerunner of Galileo. He remained unapologetically Aristotelian in too many other respects, continuing to hold that motion and rest are contrary states of bodies and that the world is finite in extent. Buridan seems to have been a philosopher who, though he was well aware of the shortcomings of the Aristotelian natural philosophy, tried to reshape as much of it as he could in the face of an increasingly mechanistic worldview.[52] His revolution was in the details. The big, decisive break was left to his successors.

Buridan's account of motion is in keeping with his approach to natural science, which is empirical in the sense that it emphasizes the evidentness of appearances, the reliability of a posteriori modes of reasoning, and the application of naturalistic tropes or models of explanation (such as the concept of impetus) to a variety of phenomena. He is inclined to dismiss purely theological assumptions as irrelevant to the practice of philosophy: “one might assume that there are many more separate substances than there are celestial spheres and celestial motions, viz., great legions of angels [*magnae legiones angelorum*], but this cannot be proved by demonstrative arguments originating from sense perception” (QMII.9: 73ra).[53] But there are some theological considerations that must be taken seriously. He concedes that divine omnipotence is such that it is always possible for God to deceive us in ways we could never detect, although this is tempered by his confidence, for which he cites empirical evidence, that our ordinary powers of perception and inductive inference are sufficiently reliable to make “the comprehension of truth with certitude possible for us” (QM II.1: 9ra). He has little patience for skeptical arguments

questioning the possibility of scientific knowledge, such as those he believed were advanced by Nicholas of Autrecourt, arguing that it is absurd to demand that all knowledge be demonstrable by reduction to the principle of non-contradiction. Natural science is about what happens for the most part, i.e., assuming the common course of nature. For the same reason, explanatory models in one special science can be helpfully applied to others. Thus, the concept of impetus recurs in Buridan's psychology to explain the difference between occurrent and dispositional thinking, as well as in his ethics, to account for the relative ease with which virtuous persons are able to do the right thing (they have acquired a kind of impetus to act virtuously).

In psychology, the study of moving beings *qua* animate, Buridan changed the Aristotelian paradigm in important ways. In contrast with Thomas Aquinas, who wanted to attribute metaphysically more robust qualities, such as *per se* subsistence, to the human soul, Buridan does not think that psychology is in a position to reveal anything about the inherent nature of its subject, and refuses to speculate about it. He sees the science of psychology as concerned not with some quidditative concept of the soul arrived at by *a priori* reasoning, but with specifying the relation between animate qualities and the soul as their proper subject: “the natural philosopher only studies substances in relation to their motion and operations. And since natural forms require for their operations a determinate matter made suitable for them by qualitative and quantitative dispositions, natural scientists must define forms through their proper matter. Therefore, in its natural definition, the soul must be defined by means of a physical, organic body” (QDA II.3: 34). This led to an even more attenuated conception of the soul in the *De anima* commentaries of Buridan's Parisian successors, Nicole Oresme and Peter of Ailly, for whom the soul functions as a kind of placeholder whose nature is not even relevant to psychology. Consideration of the soul's ultimate nature moved instead to the faculty of theology, where it was considered along with the same Augustinian dreaming arguments that undoubtedly influenced Descartes.[54]

Buridan's resolute naturalism is even more evident in his account of human knowledge. Here he is a representationalist, but mainly because he can find no evidence to support the contrary view, defended by both Duns Scotus and William of Ockham, that humans also possess an intuitive mode of knowing which gives them a direct and unmediated awareness of the existence of some object.[55] Buridan holds that cognition can occur only when the intellect apprehends an object by means of a particular species or concept representing it. How we use the concept in our act of apprehension determines whether we cognize singularly or universally: singularly, if its object appears to us “in the manner of something existing in the presence of the person cognizing it” universally, if we focus on certain features of the concept to the exclusion of others, such as when we cognize “all human beings indifferently” via the humanity that is in the concept of Socrates (QDA III.8: 79-80; QP I.7: 8va). How do we know whether our concept of Socrates is really a concept of Socrates? As noted above, Buridan tends to regard skeptical worries as tiresome and pedantic. Like most pre-Cartesian epistemologists (if it makes sense to use that term before Descartes), he is more interested in explaining the process by which we come to have knowledge than he is in justifying knowledge claims.

7. Ethics

Buridan's commentary on Aristotle's *Nicomachean Ethics* is one of his most influential works, though it is one of the least studied. It contains significant discussions of the structure of the will and its relation to the intellect, the nature of human freedom, the phenomenon of *akrasia* or weakness of will, practical reason, and the unity of the virtues.[56]

In moral psychology, Buridan appears to effect a compromise between two rival views of the relation between the will and the intellect: the intellectualist or naturalist tradition associated with Aristotle and Thomas Aquinas, according to which the will is always subordinate to the intellect, and the voluntarist tradition of Augustine and Franciscan thinkers such as Duns Scotus and William of Ockham, which held that the will is sometimes capable of autonomous activity. Buridan's apparent compromise is to argue (with the intellectualists) that human happiness ultimately consists in an intellectual act, “the perfect apprehension of God”, rather than in a volitional act such as perfectly willing or perfectly loving God (QNE X.5: 213rb), although he emphasizes (with the voluntarists) the role of the will as a self-determining power in achieving that end. The compromise turns on Buridan's innovative conception of free choice, which develops Albert the Great's notion that certainty admits of degrees.[57] The idea is that even if the will lacks the power to choose evil as such, it is still able to defer its choice and do nothing if the goodness of one of the alternatives presented to it is unclear or uncertain. Of course, given our poor epistemic position in this life, it will almost always have this power because it is almost always possible in practice to doubt the goodness of a proposed course of action. The compromise is only apparent, however, because it turns out that the will's act of deferment is possible only if “the intellect would judge it to be good to consider the matter further” (QNE III.5: 44va).[58] This claim, together with his assumptions that the will can only choose non-optimally through ignorance or impediment (QNE III.3-5; 9), places deferment squarely under the jurisdiction of the intellect, which must weigh the relative goodness of different possible courses of action, including deferment. It is not the case that the will can choose to defer regardless of what the intellect decides, or that the will can choose to defer even if the intellect has judged deferment to be less good than some other course of action. Accordingly, if this is a compromise between the intellectualists and the voluntarists, it is a disingenuous one. It is more likely that Buridan simply appropriated voluntarist terminology to express what is otherwise a straightforwardly intellectualist account of the will, perhaps to dispel the cloud of heterodoxy which had surrounded intellectualist moral psychology since the Condemnation of 1277.[59]

It is also in Buridan's moral psychology that we find the most plausible explanation of the example that has come down to us known as ‘Buridan's Ass’, in which a donkey starves to death because it has no reason to choose between two equidistant and equally tempting piles of hay. This particular example is nowhere to be found in Buridan's writings, although there are versions of it going back at least to Aristotle (see *De Caelo* 295b32).[60] The best explanation of its association with Buridan is that it originated as a parody of his account of free choice by later critics, who found absurd the idea that the will's freedom could consist in inaction, i.e., in its ability to defer or ‘send back’ for further consideration any practical judgment that is not absolutely certain.

Stanford Encyclopedia of Philosophy
Notes to John Buridan

Notes

1. Michael 1985: 79-238; 399-404. The best bibliographical resource on Buridan is by Fabienne Pironet, available at her website (see address under *Other Internet Resources* below).

2. However, the significance of such details is beginning to be understood more fully by historians through recent prosopographical research. See Courtenay 1999.

3. For a discussion and careful debunking of each of these stories, see Faral 1950: 9-33.

4. Faral 1950: 16.

5. See Zupko, *John Buridan: Portrait of a 14th-Century Arts Master*, Chapter 10.

6. Faral 1950: 11.

7. There is also a commentary on Aristotle's *Politics* that has been mistakenly attributed to Buridan, though it is actually the work of Nicholas of Vaudemont, a late 14th-century Parisian Arts Master who was much influenced by Buridan. See Flüeler 1992: vol. 1, 132-68.

8. For discussion of Peter of Spain and the teachings of the *Summulae logicales*, see Joke Spruyt's article, "Peter of Spain (Petrus Hispanus)" in this *Encyclopedia*.

9. By the beginning of the 14th century, arts masters were no longer teaching grammar at the University of Paris. The last arts master to compose a treatise on grammar was Radulphus Brito (d. 1320). What appears to have happened is that the teaching of grammar was gradually taken over by quasi-independent colleges and other schools that grew up on the periphery of the university.

10. See John Trentman, "Ockham on Mental," *Mind* N.S. 79 (1970): 586-90, and Claude Panaccio, "Semantics and Mental Language," in *The Cambridge Companion to Ockham*, ed. Paul Vincent Spade, (Cambridge: Cambridge University Press, 1999): 53. See also Ockham, *Summa logicae* I.1-3 (OPh I: 7-14).

11. *Summa logicae* III.3 (OPh: 46). As Paul Spade puts it, "[for Ockham,] self-reference is to be allowed

except where it would lead to paradox — in short, it is licit except where it is illicit" ("Ockham on Self-Reference," *Notre Dame Journal of Formal Logic* 15 (1974): 299).

12. I owe this insight to Joël Biard (1989: 196).

13. For Buridan's treatment of the concept of infinity, see Thijssen 1991. For his conception of points, see Zupko 1993b.

14. For discussion of some 14th-century views on this distinction, see Sten Ebbesen, "Is Logic Theoretical or Practical Knowledge?," in *Itinéraires d'Albert de Saxe: Paris-Vienne au XIVe siècle*, ed. Joël Biard (Paris: Vrin, 1991): 267-283.

15. For discussion, see Paul Vincent Spade, "The Semantics of Terms," in *The Cambridge History of Later Medieval Philosophy*, ed. Norman Kretzmann, Anthony Kenny, and Jan Pinborg (Cambridge: Cambridge University Press, 1982): 192-3, and E. J. Ashworth, "Logic, Medieval," in *The Routledge Encyclopedia of Philosophy*, vol. 5, ed. Edward Craig (London: Routledge, 1999): 753-4.

16. Thus, Peter of Spain: "Simple supposition is the taking [*acceptio*] of a common term for the universal thing signified by it" (Peter of Spain: Tractatus (called afterwards '*Summulae logicales*'), ed. L. M. de Rijk (Assen: van Gorcum, 1972): 81). Early terminist logicians, it should be mentioned, did not all agree about the divisions of supposition. Peter, for example, does not mention material supposition, though William of Sherwood includes it in his *Introductiones in logicam*, 5.2 (Norman Kretzmann, *William of Sherwood's 'Introduction to Logic'*, Minneapolis: University of Minnesota Press, 1966): 107). See also Joke Spruyt, "Peter of Spain (Petrus Hispanus)" in this *Encyclopedia*.

17. William of Ockham, *Summa logicae* I.68; OPh I: 207. For nominalists such as Ockham, personal supposition offers a guide to ontology, since a term can supposit personally only for what exists *per se*.

18. Notice also that this severs the traditional connection between personal and material supposition as varieties of proper supposition. For Buridan, the only proper supposition is personal supposition; all of the others are strictly speaking improper. Stephen Read has linked Buridan's position on material supposition as improper with the breakthrough doctrine—first fully realized in the work of Buridan's student, Marsilius of Inghen—that material supposition is possible only if materially suppositing terms are significative, or stand for what they signify. See Read, "How is Material Supposition Possible?" in *Medieval Philosophy and Theology* 8 (1999): 18 and S 7.3.4: 522, where Buridan considers '*Homo est species*' as an instance of the fallacy of equivocation.

19. The qualification, 'at least in the first instance', is intended to cover the conventionality of signification beyond these primary acts of imposition, which are in Buridan's view naturally determined. He conveys this idea by saying that such concepts are acquired 'immediately [*statim*]', i.e., without deliberation: "from the singular visual cognition there immediately arises the universal intellectual

cognition, and so when we see this man, we immediately think of [a] man" (S 4.5.3: 296). Nevertheless, it is clear that even the signification commonly and principally given to the term 'man' could be changed after the fact if everyone agreed to use it in a different way. The case is somewhat more complicated at the conceptual level, since it does not seem open to any individual language-user to change the significance of his/her concepts at will. But even these can be changed indirectly, as a result of the dialectical relationship Buridan takes to hold between concepts and spoken or written languages. Thus, someone who learns from a book that kangaroos are marsupials does not acquire a new concept, but augments or modifies the concept he already has.

20. Not surprisingly, terms in the propositions of logic are said to occur in material supposition, since logic concerns the conventional classification of significant utterances and patterns of reasoning and persuasion. Its objects are the immediate, rather than the ultimate, significates of terms. See S 4.3.2: 257-8.

21. See Paul Vincent Spade, "Why Don't Mediaeval Logicians Ever Tell Us What They're Doing? Or, What Is This, A Conspiracy?", available online at www.pvspade.com/Logic.

22. Hughes 1989: 97. See also Simo Knuuttila, "Medieval Theories of Modality," in this *Encylopedia*.

23. See Knuuttila 1991: 487; Lagerlund 2000: 162-4. See also Knuuttila, "Modal Logic," in the *Cambridge History of Later Medieval Philosophy*: 355-7, and "Medieval Theories of Modality," in this *Encylopedia*.

24. See Eileen Sweeney, "Literary Forms of Medieval Philosophy," in this *Encyclopedia*.

25. A typical list of positions can be found, e.g., in the *Insolubilia* of Thomas Bradwardine, which was written in the 1320s. See Paul Vincent Spade, "Insolubles," in this *Encyclopedia*.

26. Another solution, which concedes that Socrates's proposition "is true and false at the same time", is rejected as sacrificing too much. The problem with this theory is that it makes it impossible to give the contradictory of Socrates's proposition, which means that it has no proper coordinates in Aristotelian logical space.

27. This is effectively Thomas Bradwardine's solution to the Liar (see Paul Vincent Spade, "Insolubles," in this *Encyclopedia*). But it was not without precedent. Among the others who defended Buridan's solution would have been Bonaventure, who, in the course of discussing one of Augustine's arguments for the existence of God (*Soliloquies* I.15) – i.e., that if no truth exists, then some truth exists; and if some truth exists, a First Truth exists – records the objection that the first inference fails because no proposition can entail its own contradictory. Bonaventure agrees, but adds the following qualification: "one must understand that an affirmative proposition makes a two-fold assertion, one which asserts the predicate of the subject, and the other which asserts that the proposition is true … Contradiction is

concerned with the first type of assertion, not the second. So when it is said that no truth exists [*nulla veritas est*], this proposition, insofar as it denies the predicate of the subject, does not imply its opposite, which is that some truth exists. But insofar as it asserts itself to be true, it implies that some truth exists [*infert aliquam veritatem esse*]" (*Quaestiones disputatae de mysterio Trinitatis*, q. 1, a. 1, ad 5; Latin text excerpted in Spade 1975: 53). For other advocates of this solution, see Paul Vincent Spade, "*Insolubilia*" in the *Cambridge History of Later Medieval Philosophy*: 249.

28. Cf. Buridan's earlier claim that contradiction requires not only the logical form of contradiction, but the speaker's intention (S 9.7, 2nd sophism: 943).

29. Pironet 1993: 294-5. Cf. Hughes 1982: 167-9.

30. Buridan's presentation of this alternative is complicated somewhat by the doctrinal claim that the 'nothing' signified by 'A man is a donkey' is not any kind of proposition, but 'that a man is a donkey [*hominem esse asinum*]', which is the *dictum* or sentential nominalization of that proposition (expressed in Latin by the accusative + infinitive construction). In Buridanian semantics, such a construction supposits for whatever both the subject and predicate terms of its corresponding proposition supposit for, provided the proposition is true; otherwise it supposits for nothing. Gyula Klima remarks that this is how "Buridan manages to assign some credible semantic function to such sentential nominalizations without having to subscribe to a dubious ontology of eternal or quasi-eternal *enuntiabilia*, or *complexe significabilia*, distinct from ordinary substances and accidents" (Klima 2001: 844, n. 28; for his reaction to those who did seem to subscribe to such an ontology, see section 3 above). Buridan's sensitivity to the ontological dimensions of the problem emerges when he says that "'that a man is a donkey' is nothing, because a man cannot be a donkey [*hominem esse asinum nihil est, eo quod homo non potest esse asinus*]" – which also suffices for its falsity.

31. A further problem has been drawn to my attention by Paul Spade, in his comments on an earlier draft of this article: "if every proposition signifies *se esse veram*, and we're construing the infinitival expression personally, we've got a problem. For it the proposition is *false*, the infinitival expression has nothing it can signify, so that the proposition really *doesn't* have any additional signification at all, contrary to the whole point of the theory". If Buridan was aware of this as an additional problem for the first solution, he does not mention it.

32. As Hughes 1982 has suggested, the force of 'virtually' in 'virtually implies' is that the second proposition would be implied by the first only if the first is actually formulated (169). This emerges in a closing comment on the sophism in which Buridan remarks, "perfecting this solution, we have to say that every proposition, adding *that it exists*, implies that it is true" (S 9.8, 7th sophism: 970).

33. Of course, this holds only for affirmative propositions. Negative propositions are true if their subject and predicate terms *do not* stand for the same thing or things.

34. For a helpful overview, see Thijssen 1998: "In many official documents and other texts, philosophers and theologians were exhorted not to cross the boundaries of their own fields—a reference to *Proverbs* 22:28—and not to become theologizing philosophers and philosophizing theologians" (2).

35. Aristotle, *Metaphysics* VI.1.1026a18; XI.7.1064b1.

36. Precedents for reading 'theology' as 'metaphysics' in this context—which is somewhat obscured by the fact that the incunabular edition of Buridan's *Metaphysics* commentary erroneously gives '*metaphysica totalis*' for '*mathematica totalis*' and '*metaphysicus*' for '*mathematicus*' in the 23rd and 25th lines of folio 34ra—can be found in Robert Kilwardby, *De Ortu Scientiarum* LXVI.655 and Thomas Aquinas, *In De trin*. V, a. 4, as well as in Albert the Great.

37. Thomas puts this same distinction in terms of the *ratio* or concept under which the subject is considered: "although philosophy considers all existing things according to concepts [*rationes*] taken from creatures, there must be another science, which considers existing things according to concepts [*rationes*] taken from the inspiration of the divine light" (*In I Sent*., Prol., q.1, a.1, ad 1; cf. *In De trin*., q.5, a.1-4).

38. For this reason as well, Buridan never tries to compare the methods of philosophy and theology, let alone to suggest how the former might be subsumed by the latter. He is aware of the possibility of rapprochement between the two sides, if only by its absence from the Parisian scene: "it seems to me that this question [about whether it is possible for demonstration to cross disciplinary lines] is difficult first because there has been exceedingly little discussion between the philosophers and the doctors [of theology], and second because it touches on the means of distinguishing the sciences, and it is even more difficult to assign whence, and in what way, the sciences originally received their distinction" (*QAnPo* I.23).

39. See also Gyula Klima's article, "Medieval Theories of Universals" in this *Encyclopedia*, especially sections 8-10.

40. Buridan's allusions to Plato on universals are fairly typical: see, e.g., QM VII.15: 50va-vb, and de Rijk 1992. On other topics, however, he is sometimes suspicious about whether a position handed down as Plato's is in fact Plato's. For example, after disposing of an argument introduced "on the authority of Plato" for the role of separate substances in the generation of living things, he concludes, "and so in this way Plato's opinion is destroyed – if he in fact had an opinion of the sort we have ascribed to him" (QM VII.9: 47ra). For discussion of Buridan and Plato, see Schönberger 1994: 292-95.

41. For the meaning of 12th-century nominalism, see the special issue of *Vivarium* (30.1, May 1992) devoted to this topic.

42. See Peter King, "John Buridan's Solution to the Problem of Universals" in Thijssen and Zupko 2001:

1-27. King argues that Buridan's nominalism has three interrelated aspects: (1) the ontological thesis that there are no non-individual entities in the world; (2) the psychological thesis that some concepts, though metaphysically particular, can represent more than one individual thing; and (3) the semantic thesis that such concepts also function as common names in Mental Language.

43. Cf. QIP 4: 138, ll. 565-566. Buridan's treatment of transcendental terms is similar: "the subject of metaphysics is being, that is, the term 'being'" (QIP 3: 135, ll. 449-450).

44. Buridan even regards it as conventional that we treat universals as second-intentional names (TDUI: 145-146). Universals are substances in the second mode of substance only, i.e., "they are terms in the category of substance" (QIP 4: 140, ll. 635-636); likewise, "'universal' is a transcendent name", and such names occur on one level only (TDUI: 147); and as a form, a universal is a second intention (TDUI: 148)

45. Note also that the differences in universal names do not correspond to any real diversity in the things signified by those names, "but in the medium through which we arrive at the concepts by which those names are imposed" (QIP 11: 173, ll. 1853-1854). The "medium" is the more common or general concept, e.g., of sensing, from which the common concept of everything sensitive is formed, and names such as 'animal' are imposed (QIP 11: 173, ll. 1847-1850).

46. That the object of knowledge is a *complexum*, or proposition, rather than an *incomplexum*, or a term, follows from the fact that we can believe or know only what can be true or false, and only propositions can be true or false.

47. For discussion, see Normore 1985.

48. For discussion, see Maier 1955: 214-15 and Adams 1987: 184-5.

49. See Duhem 1906-13 and Maier 1955. For discussion, see Grant 1977.

50. Thus, for Aristotle, the thrown javelin does not continue to move because of any force inside the javelin (which is, after all, an inanimate object), but because its movement through the air creates a vacuum behind it which the surrounding air rushes in to fill, thereby pushing the javelin forward.

51. We do not know precisely where Buridan got the idea of impetus, but a less sophisticated notion of impressed forced can be found in Avicenna's doctrine of *mayl* (inclination). In this he was possibly influenced by Philoponus, who was developing the Stoic notion of *hormé* (impulse). For discussion, see Zupko 1997.

52. We can also see this in his defense of the sufficiency of efficient causality in explanations of natural phenomena, which eventually led to the eclipse of final causality several centuries later. For discussion, see Des Chene 1996: 186-7.

53. It would not be like Buridan to rule out theological considerations completely. Indeed, he sometimes confronts theological issues with what can only be described as intellectual playfulness. Edith Sylla nicely describes his method here: “Buridan does not exclude theology from physics, along the lines of Boethius of Dacia, nor does he overwhelm physics with theology, along the lines of today’s Creationists. Rather, in a moderate way, Buridan introduces theological truths into the body of Aristotelian physics and then shows, plausibly, that to draw inferences from physics plus theology, it is necessary to add other hypotheses [e.g., to assume a reference frame for extra-cosmic motion, or a ‘time’ to measure duration before creation]—to beg the human intellect” (Sylla, “*Ideo quasi mendicare oportet intellectum humanum*: The Role of Theology in John Buridan’s Natural Philosophy,” in Thijssen and Zupko 2000: 244-5).

54. See Zupko 1999 and Zupko 2001.

55. See Zupko 1993a.

56. For further discussion, see Krieger 1986 and Walsh 1986.

57. See Saarinen 1993: 161-93.

58. The page number is mistakenly given as “lxiiii” in the Paris 1513 edition.

59. For further discussion, see Zupko 1995 and Fabienne Pironet, “The Notion of ‘*Non Velle*’ in Buridan’s Ethics,” in Thijssen and Zupko 2001: 199-219.

60. The earliest association of the example with Buridan appears to be in Spinoza, *Ethica* II, scholium to Proposition 49.

Insolubles

The medieval name for paradoxes like the famous Liar Paradox ("This proposition is false") was "insolubles" or *insolubilia*.[1] From the late-twelfth century to the end of the Middle Ages and beyond, such paradoxes were discussed at length by an enormous number of authors. Yet, unlike twentieth century interest in the paradoxes, medieval interest seems not to have been prompted by any sense of theoretical "crisis."

The history of the medieval discussions can be divided into three main periods: (a) an early stage, from the late-twelfth century to the 1320s; (b) a period of especially intense and original work, during roughly the second quarter of the fourteenth century; (c) a late period, from about 1350 on. The discussion in this article will be organized as follows:

1. Origins of the Medieval Discussion

The Liar Paradox was well known to antiquity. Its discovery is often credited to Eubulides the Megarian (4th century BCE), on the basis of a remark by Diogenes Laertius (*Lives of the Philosophers* II.108), although in fact Diogenes says only that Eubulides discussed the paradox, not that he discovered it.[2] A little later, the poet and grammarian Philetus (or Philitas) of Cos (c. 330-c. 270 BCE), if we are to believe the story in Athenaeus of Naucratis's *Deipnosophists* IX.401e, worried so much over the Liar that he wasted away and died of insomnia, as, according to Athenaeus, his epitaph recorded:

> Philetus of Cos am I
> 'Twas The Liar who made me die,
> And the bad nights caused thereby.[3]

Diogenes Laertius also reports (VII.196-98) that the Stoic logician Chrysippus (c. 279-206 BCE) wrote:

- *Introduction to the Liar;*
- *Liar Propositions: An Introduction;*
- six books on the Liar itself;
- *Reply to Those Who Think There Are Propositions That Are Both True and False;*
- *Reply to Those Who Solve the Liar Proposition by Division;*
- *On the Solution to the Liar* (in three books);
- *Reply to Those Who Say The Liar Argument Has False Premises.*

1.1 Unlikely Ancient Sources

But it does not appear that medieval interest in insolubles was derived directly from these or any other known ancient sources that discuss the Liar. Many of the relevant works were lost (e.g., the works of Chrysippus), while others were never translated into Latin and so were effectively unavailable to the Middle Ages. Indeed, it is not at all clear just *what* it was that prompted medieval interest. One might have supposed that, even if particular *theories* about the Liar were not transmitted to the Middle Ages from antiquity, at least *formulations* of Liar-type paradoxes must have been known and available to stimulate the medieval discussions. In fact, however, there are strikingly few possibilities.

Seneca (*Epistle* 45.10), for instance, mentions the Liar paradox by its Greek name *pseudomenon*, but does not actually formulate it. Again, St. Augustine perhaps has the Liar in mind in his *Against the Academicians* (III.13.29), where he refers to the "most lying calumny, 'if it is true [it is] false, if it is false

it is true'." But neither passage would likely be sufficient by itself to suggest the special problems of the Liar to anyone not already familiar with them.

Somewhat more explicit is Aulus Gellius's (2nd century CE) *Attic Nights* (XVIII.ii.10), "When I lie and say I am lying, am I lying or saying the truth?" But Gellius was not widely read in the Middle Ages, and no known medieval author cites him in the context of insolubles.[4] Again, Cicero's *Academica priora,* II.xxix.95-xxx.97, contains a fairly clear formulation: "If you lie and speak that truth, are you lying or speaking the truth? ... If you say you lie, and you speak the truth, you lie; but you say you lie, and you speak the truth; therefore, you lie." But this passage is never cited in the *insolubilia*-literature. Moreover Cicero, who wrote in Latin and so did not have to be translated to be available to the Middle Ages, calls such paradoxes "inexplicables" (*inexplicabilia*). If he was the catalyst for the medieval discussions, we would have expected to find that term in the *insolubilia*-literature, and we do not; the unanimous medieval term is 'insolubles'.

1.2 St. Paul's Reference to Epimenides

One initially plausible stimulus for the medieval discussions would appear to be the Epistle to Titus 1:12: "One of themselves, even a prophet of their own, said, The Cretians [= Cretans] are always liars, evil beasts, slow bellies." The Cretan in question is traditionally said to have been Epimenides, himself a Cretan. For this reason, the Liar Paradox is nowadays sometimes referred to as the "Epimenides." Yet, blatant as the paradox is here, and authoritative as the Epistle was taken to be, not a single medieval author is known to have discussed or even acknowledged the logical and semantic problems this text poses. When medieval authors discuss the passage at all, for instance in Scriptural commentaries, they seem to be concerned only with why St. Paul should be quoting pagan sources.[5] It is not known who was the first to link this text with the Liar Paradox.

1.3 Aristotle's *Sophistic Refutations*

By contrast with these passages, none of which was cited in the *insolubilia*-literature, there is a text from Aristotle's *Sophistic Refutations* 25, 180a27-b7, that, from almost the very beginning of the *insolubilia*-literature to the end of the Middle Ages, served as the framework for discussing insolubles. It occurs in Aristotle's discussion of the fallacy of confusing things said "in a certain respect" (*secundum quid*) with things said "absolutely" or "on the whole" (*simpliciter*). In this context, Aristotle supposes a man who takes an oath that he will become an oath-breaker, and then does so. Absolutely or on the whole, Aristotle says, such a man is an oath-breaker, even though with respect to the *particular* oath to become an oath-breaker he is an oath-keeper. Then Aristotle adds the intriguing remark, "The argument is similar too concerning the same man's lying and speaking the truth at the same time" (180b2-3). It was this sentence that many medieval authors took to be a reference to the Liar Paradox, which therefore, on the authority of Aristotle, could be solved as fallacy *secundum quid et simpliciter*.

The widespread appeal to this passage throughout the history of the *insolubilia*-literature indicates that the text did play some role in prompting medieval interest in insolubles. This suggestion is reinforced by

the fact that the earliest known medieval statement of the Liar occurs in 1132, around the time the *Sophistic Refutations* first began to circulate in Western Europe in Latin translation. (See Section 2 below.)

Nevertheless, it is hard to see how Aristotle's remarks can be made to fit the Liar Paradox. The oath-breaker, as the example was generally interpreted, takes *two* oaths: one, which he keeps, that he will commit perjury, and a second (it does not matter what it is) that he breaks, thereby fulfilling the first oath. The man is an oath-breaker and an oath-fulfiller, but with respect to *different* oaths; by breaking his second oath, rendering it false, he fulfills the first oath, making it true. It is a long way from that to the Liar Paradox, in which the *same* proposition is (it seems) both false and true. Despite what was interpreted as Aristotle's suggestion that the latter case fits the pattern of the former, it does not. Unless one *already* knew about the Liar, therefore, it is hard to see how this passage from Aristotle would have suggested it to anyone.[6]

In short, it seems clear that the *Sophistic Refutations* was instrumental in prompting medieval interest in insolubles. But more must have been involved too. Before medieval logicians could formulate genuine Liar-type paradoxes, they first had to go well beyond anything found in Aristotle's text. At present we cannot say whether they did this on the basis of some still unidentified ancient source or whether it was through their own intellectual power and logical insight.

2. Early Developments to the 1320s

In 1132, Adam of Balsham, the founder of the important logical school of the "*Parvipontani*" (so called because they gathered at the Petit Pont in Paris), wrote an *Art of Discussing* (*Ars disserendi*), in which he treats, among other things, various kinds of yes/no questions, including "whether he speaks truly who says he lies" and "whether he who says nothing but that he lies is saying the truth." (Adam of Balsham 1956, p. 107.)

The importance of this passage should not be exaggerated. It is true that it gives us the earliest known explicit medieval formulation of the Liar.[7] But Adam gives no attempt to *solve* the paradox, does not say it was a current topic of discussion in his day, and in fact does not even indicate he recognized its paradoxicalness. He simply offers it as an *example* of one kind of yes/no question.

It is not until later in the twelfth century that one finds an explicit statement of the special problems raised by insolubles. In his *On the Natures of Things* (*De naturis rerum*), of unknown date but apparently well known by the end of the century, Alexander Neckham 1967, p. 289, says[8]:

> Again, if Socrates says he lies, and says nothing else, he says some proposition. Therefore, either a true one or a false one. Therefore, if Socrates says only that he lies, he says what is true or what is false.

> But if (1) Socrates says only the proposition that Socrates lies, and he says what is *true*, then it is true that Socrates lies. And if it is true that Socrates lies, Socrates says what is false. Therefore, if Socrates says only the proposition that Socrates lies, and he says what is true, he says what is false.
>
> But if (2) Socrates says only the proposition that Socrates lies, and he says what is *false*, then it is false that Socrates says what is false. And if it is false that Socrates says what is false, Socrates does not say what is false. But if Socrates says only that he lies, he says either what is true or what is false. Therefore, if Socrates says he lies, he says what is true. Therefore, if Socrates says only that he lies, and he says what is false, then he says what is true.
>
> But if Socrates says only that he lies, he says what is true or false. Therefore, if Socrates says only that he lies, he says what is true *and* says what is false.

Nevertheless, although clearly Neckham was fully aware of what is paradoxical about the Liar, he makes no attempt to *solve* the paradox. He presents it only as an example of the "vanities" logic deals with. This suggests that by his day others *were* trying to solve the paradox, and in fact in the discussion of the fallacy *secundum quid et simpliciter* contained in the so called *Munich Dialectic* (= *Dialectica Monacensis*) from sometime in the second half of the century, we find the remark: "But how this fallacy arises in uttering the insoluble ‘I am saying a falsehood’, that is a matter discussed in the treatise on insolubles."[9]

The first text we have that actually tries to solve the paradox is an anonymous treatise from the very end of the twelfth or the very early thirteenth century (De Rijk 1966). From then on, there are a great number of surviving treatments. (See Spade 1975.) In the early 1320s, Thomas Bradwardine, in a preliminary section of his own treatise on insolubles, lists nine views in circulation in his day. (See Spade 1975, pp. 106-08; Spade 1987, pp. 43-46.) Some of these views can no longer be identified in the texts that survive from the period before Bradwardine, but among the surviving views, we can distinguish five broad approaches to "solving" the paradox.[10] (Sometimes these approaches are combined in a single author.)

2.1 Insolubles as Fallacies *secundum quid et simpliciter*

As might be expected in view of Section 1.3 above, many of these early theories attempted to analyze insolubles as fallacies *secundum quid et simpliciter*. Later in the *insolubilia*-literature, discussions often continued to be cast in terms of this fallacy, even though their real focus was generally on entirely different theoretical issues; Bradwardine is a good example.[11] The role of the fallacy thus became purely "honorary," preserving the authority of Aristotle.

In the early period, however, many but by no means all authors actually tried to *solve* insolubles as fallacies *secundum quid et simpliciter*. But for reasons described in part in Section 1.3 above, such

attempts were not very satisfactory. They often ended up adopting Aristotle's terminology, but using it in ways quite different from what he intended.

Aristotle had suggested (180b5-7) that insolubles are false *simpliciter* (absolutely/on the whole), but true *secundum quid* (in a certain respect). Some authors in the early medieval literature, however, argued that insolubles are absolutely neither true nor false, but only true in a certain respect and false in a certain respect.[12] Others used the terminology of *simpliciter* and *secundum quid*, but applied it to reference (*suppositio*) rather than to truth and falsehood, so that in insolubles certain terms did not refer "absolutely" to their referents, but only "in a certain respect." These views are in effect a kind of restriction on self-reference.[13]

2.2 The Theory of *Transcasus*

The theory of *transcasus* has nothing to do with the fallacy *secundum quid et simpliciter,* although it too seems to have had its origins in antiquity. The word *transcasus* is not a usual Latin word. It seems to be a literal translation of Greek *metaptosis.* In Stoic logic, propositions that change their true value over time were called *metapiptonta* (from the same root). Walter Burley in fact used the word exactly this way in 1302 in two short logical works. (Spade 1987, pp. 33-34.)

Nevertheless, while the term *transcasus* in the context of insolubles does have an association with time, it does not imply any *change* of truth value over time. Rather the theory of *transcasus* held that in the proposition ‘This statement is false’, the term ‘false’ refers *not* to the proposition in which it occurs, but rather to some proposition uttered earlier. Thus, when the liar says "I am lying," what he really means is "What I said just a moment ago was a lie." If the speaker did not in fact say anything earlier, then his present statement is simply false and no paradox arises.[14]

This odd view, like the last of those discussed in Section 2.1 above, amounts in practice to a restriction on self-reference. But it is not clear exactly what motivated it. In any event, the theory of *transcasus* appears to have disappeared as a theory actually held by anyone after the early period, although it continued to be mentioned in later authors' surveys of earlier views.[15]

2.3 Exercised Act vs. Signified (or Conceived) Act

A third theory from this early period distinguishes the "exercised" act from the "signified" or "conceived" act. The details of this theory are not yet well understood, but the basic strategy is to distinguish what the liar *says* he is doing (namely, lying) from he really *is* doing. John Duns Scotus, who held a version of this theory in his *Questiones on the Sophistic Refutations* (Scotus 1958), thought that what the liar is *really* doing (his "exercised act") is speaking the truth. In order to avoid the paradox, this theory would seem to be committed to saying that the exercised act and the signified act are *two* distinct acts, so that the theory, like the theory of *transcasus* (Section 2.2 above), is committed to some kind of restriction on self-reference.[16]

2.4 The Theory of Restriction

Even when not combined with *transcasus* or the theory that distinguishes exercised act from signified act, a very popular approach throughout the *insolubilia*-literature, in the early as well as the later period (and for that matter even in our own day), was to deny or restrict the possibility of self-reference. Such theories were called "restriction," and their proponents were called "restricters" (*restringentes*). All such theories maintained that in some or all cases, terms in propositions could not "supposit for" (stand for, refer to) the propositions in which they occur.

Some theories of restriction went further and also ruled out other patterns of reference. For example:

- Proposition *a* = ‘*b* is true’, and *b* = ‘*a* is false’. Here *a* refers to *b* and *b* refers back to *a*. But reference is not a transitive relation, so that there is no real *self*-reference here. Nevertheless, the situation is paradoxical, and as a result some authors ruled out all referential "loops."
- Proposition *a* is a certain token of the form ‘*a* is false’, and *b* is a second token of the same type. Token *a* is self-referential, but token *b* is not, since it refers to *a*, not to itself. Yet some authors thought the two tokens should be treated semantically alike, so that not only the subject of *a* could not refer to *a* itself, neither could the subject of *b*.
- Proposition *a* = ‘*b* is true’, and proposition *b* = ‘*b* is false’. Here, *b* is self-referential, but *a* is not. Nevertheless, *b* is the contradictory of *a*. Hence, by saying its contradictory is true, *a* is in effect saying that it itself is false. Thus, although it is not self-referential, *a* is nevertheless paradoxical. Some authors prevented such cases by maintaining that not only were terms unable to refer to the propositions in which they occurred, they also could not refer to the *contradictories* of the propositions in which they occurred.

As a general theory, restriction is open to an obvious objection: it rules out innocuous forms of reference along with pathological ones. The sentence ‘This sentence has five words’ is not paradoxical, after all, even though it is self-referential; in fact, it seems obviously true. Yet the theory of restriction would disallow it.

Medieval authors sometimes raised this objection. As a result, we find *two* kinds of restriction-theories in the medieval literature: (a) general or strong theories that rule out self-reference, and perhaps other patterns of reference too, in innocuous as well as pathological cases; and (b) more specialized or weaker theories that rule out certain forms of reference only when they result in paradox. Walter Burley and William of Ockham, for example, held the latter form of restriction (Spade, 1974).

If general or strong theories of restriction are open to the objection stated above, the weaker theories are open to a different objection: they are vacuous. The proponents of weaker theories did not have any independent way of identifying paradoxical cases. In practice, their theories amounted to saying "all forms of reference are allowed, except for paradoxical ones, which are not allowed." This is no doubt true, but it is also a tautology.[17]

2.5 Cassation

Unlike restriction, which remained (and remains) a popular view, the theory of "cassation" disappeared very early. It is maintained in the earliest known treatise on insolubles (De Rijk 1966) and in one other anonymous text (Spade 1975, pp. 43-44), but died out after about 1225, although it continued to be mentioned in later authors' surveys of previous views, no doubt because of its inclusion in Bradwardine's own survey.

‘Cassation’ is now an archaic word, but merely means "making null and void, canceling." In effect, this theory holds that one who utters an insoluble proposition "isn't saying anything." The second of the two texts just cited even gives a curious "ordinary language" argument, appealing to the *rusticus* (the man-on-the-street), who, if you were to say to him "What I am saying is false," would reply *"Nil dicis"* ("You are saying nothing").

The treatise in De Rijk 1966 presents more of a theory. Much of it is obscure to modern scholars, but it seems to appeal to a distinction between a mental act of asserting and a vocal act of uttering a proposition. "Saying" requires both acts; it is "an assertion with utterance." In the case of the liar who says "What I am saying is false," the mental act of asserting is present, and for that matter so is the physical act of uttering the words. But somehow (this is the obscure part) there is no "saying."

It is tempting to interpret this view as an appeal to a kind of fallacy of composition; just as someone who is both good and an author is not necessarily a good author, so too something that is both mentally asserted and vocally uttered is not necessarily "said" (asserted with utterance). It is tempting, yes, but highly speculative. Nevertheless, whatever the correct interpretation, it appears that the distinction between asserting and uttering drawn by this theory escapes the facile "refutation" of it used as early as the mid-thirteenth century, that it "plainly contradicts sensation that is not deceived."[18]

3. The Second Quarter of the Fourteenth Century

The preceding theories represent the earliest stage of the *insolubilia*-literature. Although these theories are sometimes mentioned in the later literature, and in the case of "restriction" often *accepted* in the later literature, much more sophisticated treatments began to emerge in the second quarter of the fourteenth century. The turning point is Thomas Bradwardine, whose own theory was enormously influential on later authors. Shortly after Bradwardine, two other authors from this middle period are also important: Roger Swyneshed, and William Heytesbury. A little later, Gregory of Rimini appears to have made important contributions to the discussion as well.

3.1 Thomas Bradwardine

Thomas Bradwardine (c. 1295-1349) wrote his *Insolubles* sometime between 1321 and 1324. It became

one of the most important works on the topic in the Middle Ages. In fact, sometime in the third quarter of the fourteenth century, Ralph Strode, in his own treatise on the topic, surveys the earlier views (quoting Bradwardine's own survey almost verbatim), and then says (Spade 1981, p. 116):

> For the opinions mentioned above were those of the old [logicians], who understood little or nothing about insolubles. After them there arose the prince of modern philosophers of nature, namely Master Thomas Bradwardine. He was the first one who discovered something worthwhile about insolubles.

Bradwardine's theory is built around a theory of truth. He adopts what has been called an "adverbial" theory of propositional signification. (Spade 1996, pp. 178-85.) By virtue of their constituent terms, propositions signify things; but, in addition, the proposition as a whole signifies *that such-and-such is the case.* It is this latter kind of signification that is the basis for Bradwardine's theory of truth.

For him, a proposition is true if and only if it signifies *only* as is the case (*tantum sicut est*), and false if and only if it signifies otherwise than is the case (*aliter quam est*). Note the absence of the ‘only’ in the criterion for falsehood. Truth therefore, is more demanding than falsehood. In order for a proposition to be true, *all* of what it signifies to be the case must in fact be the case; if *any* of what it signifies to be the case *fails* to be the case, the proposition is false.

Furthermore, like many authors, Bradwardine held that what propositions signify *follows* from them. In addition, he seems to have been the first to maintain the converse claim, what has been called "The Bradwardine Principle" (Spade 1981, p. 119-20): whatever follows from a proposition is signified by it. (That is, in more recent terminology, signification is "closed" under the consequence relation.) Combined, these two theses, together with the account of truth given in the preceding paragraph, amount to saying that a proposition is true if and only if whatever follows from it is the case.

This general theory of truth provides a solution to insolubles. For it follows from Bradwardine's semantics as just outlined that *every* proposition signifies that it itself is true.[19] Given this, consider the insoluble case where *a* = ‘*a* is false’. Now *a* signifies that *a* itself is false. We also know that it cannot signify *just* that, but must also signify that *a* is *true,* and in general whatever else follows from *a*.

Proposition *a* cannot be true. If it were, then it would signify only as is the case, and so, since it signifies that it itself is false, it would have to be *false,* not true. But if *a* is false, there is no way to argue, in the other direction, that *a* is true after all. All that follows is that *a* signifies *somehow* otherwise than is the case. And it certainly does, since it signifies that *a* is *true.* The paradox is broken.

Insolubles, then, are simply false. They are false not because of what they signify on the face of it, because that much of what they signify holds. Rather, they are false because *in addition* they also signify that they are true, and that does *not* hold.

This ingenious theory became enormously popular and widespread.[20] But it raises serious and puzzling

questions. For example, does Bradwardine accept "semantic ascent" or not? (Where ‘P’ names the proposition replacing ’*p*’, does he accept ‘*p* ⥽ P is true’ or does he not?) On one hand, since for Bradwardine every proposition signifies that it is true, and since propositions signify just whatever follows from them, it seems that he does accept it. On the other hand, we just saw that where *a* = ‘*a* is false’, we *cannot* infer that if *a* is false then *a* is true, so that it seems he does not accept it in all cases. Such questions lead into Bradwardine's theory of contradiction and his propositional logic, which are beyond the scope of this article.[21]

3.2 Roger Swyneshed

Sometime between roughly 1330 and 1335, the English Benedictine Roger Swyneshed adopted a theory in some respects reminiscent of Bradwardine's, but with interesting features of its own. Like Bradwardine, Swyneshed held that for a proposition to be true, it is not enough that it "signify as is the case." But whereas Bradwardine maintained that in addition the proposition must not signify *otherwise* than is the case (that is, it must signify *only* as is the case), Swyneshed said that in addition the proposition must not "falsify itself." Insolubles do falsify themselves, and so are false for that reason, even though they signify as is the case. Propositions that falsify themselves are said to be those that are "relevant (*pertinens*) to inferring that they are false."

The notions of "relevance," "self-falsification," and "signifying as is the case" (or "otherwise than is the case") are mysterious ones in Swyneshed's theory and not yet well understood by scholars.[22] But the main historical interest of his theory does not lie there. Rather, it lies in three famous and controversial conclusions he drew from his principles:

- Some false propositions signify as is the case. Insolubles do.[23] Thus, where *a* is the insoluble ‘*a* is false’, *a* is self-falsifying and so false. But it signifies as is the case (namely, that it is false).
- In some valid formal inferences, falsehoods follow from truths. For consider the formally valid inference "The conclusion of this inference is false; therefore, the conclusion of this inference is false." The premise and the conclusion of this inference are two tokens of the same type. But while the conclusion is a self-falsifying insoluble, and so is false, the premise is *not* self-falsifying, and is in fact *true.* (The conclusion of the inference *is* false, on Swyneshed's account.) Here then, a falsehood validly follows from a truth.
- In the case of insolubles, two mutually contradictory propositions are false at the same time. Where *a* = ‘*a* is false’, *a* is insoluble and false. But its contradictory, ‘*a* is *not* false’, Swyneshed claims, is *not* insoluble and is not self-falsifying. Nevertheless, it is false because it signifies otherwise than is the case. The insoluble *a* really *is* false.[24]

Many authors found these conclusions ridiculous, especially the second and third ones. But they had their defenders as well.[25]

Two other features of Swyneshed's theory should be at least mentioned, although our understanding of his view does not yet allow a thorough treatment of them. First, he explicitly holds that while valid

inference does not always preserve truth, it does preserve the property of signifying as is the case. Second, Swyneshed explicitly considers a situation where *a* = ‘*a* does not signify as is the case’, and says that that *a* is neither true nor false in that situation. This is the only known case of a medieval author's actually allowing failure of bivalence for insolubles, even though several authors refer to (and reject) such theories; even Swyneshed allows failure of bivalence only in some instances.[26]

3.3 William Heytesbury

In 1335, the Mertonian logician and philosopher of nature William Heytesbury wrote an important treatise *Rules for Solving Sophisms* (*Regulae solvendi sophismata*).[27] The first of its six chapters is on insolubles. The *Rules* as a whole, and this first chapter in particular, were widely read and commented on, particularly in Italy in the late-fourteenth and fifteenth centuries. Indeed, Heytesbury's theory is a competitor to Bradwardine's as the most influential theory of insolubles in the whole of the Middle Ages.[28]

Heytesbury treated insolubles as paradoxical only *with respect to* certain assumed circumstances (what he calls the *casus* or "case"). For example, the proposition ‘Socrates is saying a falsehood’ is not paradoxical in the abstract, all by itself, but only in contexts where, say, it is Socrates who utters that proposition, the proposition is the *only* proposition Socrates utters (it is not an embedded quotation, for instance, part of some larger statement he is making), and where his proposition signifies just as it normally does. Spoken and written language are thoroughly conventional, for medieval authors, so that the vocal sequence or inscription ‘Socrates is saying a falsehood’ could theoretically signify any way you want. It might, for example, signify that 2 + 2 = 4, in which case it would not be insoluble at all but straightforwardly true.

It is the last condition that is the focal point for Heytesbury's attack. He holds that in the *casus* where Socrates himself says just ‘Socrates is saying a falsehood’ and nothing else, his proposition *cannot*, on pain of contradiction, signify *just* as it normally does ("precisely as its words pretend," as he puts it). If it does signify as it normally does, it must signify some other way as well.

How else might it signify? Heytesbury did not think it was his duty to answer that question. The proposition's additional signification cannot be predicted, given the conventionality of spoken and written language. Depending on what else it signifies, different verdicts about the proposition are appropriate. In short, Heytesbury's strategy is to say, "You tell me *exactly* what Socrates's statement signifies, and I'll tell you first of all whether the case you describe is possible, and if it is, I'll tell you whether his statement is true or false."

This "shift the burden" strategy is a consequence of the fact that Heytesbury views the question of insolubles in the context of the *obligationes*, a highly formalized medieval disputation context that is still not fully understood.[29] But many later authors felt that Heytesbury had simply sidestepped the real theoretical issue, and went on to stipulate what Heytesbury would not: an insoluble's "additional" signification. They held that, in circumstances that make it insoluble, a proposition not only signifies as it

normally does; it also signifies *that is it true*. This "adjustment" to Heytesbury's theory has the effect of combining it with the tradition stemming from Bradwardine.[30] It proved to be an appealing combination.

3.4 Gregory of Rimini

Gregory of Rimini's main writing was done in the 1340s. Although today we know of no text or passage of his that discusses insolubles, there must have been one, because in 1372 Peter of Ailly cites Gregory's theory in some detail and uses it in writing his own treatise on insolubles. (Peter of Ailly 1980.)

Gregory's view relied on the traditional medieval notion (going back to Aristotle's *On Interpretation* 1, 16a3-5) of "mental language," the "language of thought" that underlies and is expressed in spoken and written language.[31] Unlike spoken and written languages, where the signification of words and propositions is thoroughly a matter of convention, signification in mental language is fixed by nature once and for all, the same for everyone. It follows that propositions in mental language can never signify otherwise than they "normally" do. Thus Heytesbury's analysis, according to which insolubles do signify otherwise than they normally do, cannot be applied to propositions formed in mental language. Although Heytesbury himself did not draw this conclusion, it follows from his theory that insolubles cannot be formulated in mental language.

In the absence of any text by Gregory on the topic, we cannot be sure that he reasoned like this from Heytesbury's position. But for whatever reason, he apparently did confine insolubles to spoken and written language; for Gregory there are no insolubles in mental language. An insoluble proposition in spoken or written language corresponds to and expresses *not* the mental proposition one would normally expect on the basis of the usual linguistic conventions, but to a complex and *non*-paradoxical mental proposition.

For example, where *a* is the spoken or written proposition '*a* is false', it corresponds to and expresses the *conjunction* of two mental propositions. The first conjunct signifies that *a* is false. Note that this is not the insoluble *a*, since that was in spoken or written language whereas this proposition is mental. Unlike *a*, this proposition is not self-referential; it refers instead to *a*.

The second conjunct signifies that the *first* conjunct is false. Since the first conjunct signifies that *a* is false, this means that the second conjunct amounts to saying that *a* is *not* false, but rather true.

One way, therefore, of viewing Gregory's theory is to say that he adopted the hybrid view described at the end of Section 3.3 above, the view that combines Heytesbury with Bradwardine, but then moved that whole analysis into mental language. Just as for Heytesbury's theory, insolubles for Gregory do not signify "precisely as their words pretend" (they do not express the mental proposition one would expect from the normal linguistic conventions). Just as for Bradwardine's theory, insolubles for Gregory do signify "as their words pretend" (through the first conjunct of the mental proposition). But they do not signify *precisely* that way; they also signify that they are *true* (through the second conjunct of the mental

proposition).

Given our present knowledge of Gregory's views, this reconstruction must remain speculative.

4. The Late Period

The period of greatest innovation and sophistication in the medieval *insolubilia*-literature was the second quarter of the fourteenth century. After about 1350, little original work was done. Insolubles continued to be discussed, but it seems that for the most part the theories adopted were variations or elaborations of the ones already seen. This period is not yet well researched, however, so it is too early for a final verdict.

4.1 John Wyclif

At any event, it is clear that one of the main (and one of the few genuinely new) theories to emerge from this late period is that of John Wyclif, who wrote a *Summa of Insolubles* (*Summa insolubilium*), probably in the early 1360s,[32] and included another discussion of insolubles in his *Continuation of the Logic* (*Logicae continuatio*), III.8. The theory is essentially the same in the two treatments.

For Wyclif, the key to resolving insolubles is to recognize various senses in which propositions can be true or false. There are three main senses of ‘true’, and accordingly of ‘false’:

- In the transcendental sense, truth is convertible with being, so that *any* proposition is true in this sense, no matter what it signifies. This sense can be disregarded in discussing insolubles. Nothing (that is, no being) is false in the sense of failing to be true in this sense.
- In a second sense, a proposition is true if and only if what it "primarily signifies" exists. These "primary significates" are neither substances nor accidents, but rather "beings of reason." It is perhaps plausible to interpret an existing primary significate as analogous to a "fact" in the modern philosophical sense. A proposition is false in this second sense if and only if its primary significate fails to exist.
- In a third sense, a proposition is true if and only if what it primarily signifies exists and is *independent* of the proposition itself. It is false in this third sense if and only if its primary significate either fails to exist or else exists but depends on the proposition itself.

The "independence" required by the third kind of truth is an obscure and difficult matter, not yet well understood. But here is how it applies to insolubles:

Where *a* = ‘*a* is false’, its primary significate either exists or does not. If it does, then in any event it is not independent of *a* in the sense required by the third kind of truth. In either case, then, *a* will be *false* in the third sense. If the word ‘false’ in *a* is taken in the third sense, therefore, *a*'s primary significate does exist, since it is a fact that *a* is false in the third sense. In short, the insoluble is true in the second sense,

but false in the third sense.

Our present understanding of Wyclif's theory does not go much beyond this. Many questions and problems remain. For instance, if the word ‘false’ in *a* is not taken in the third sense but in the *second,* the paradox seems to emerge all over again in a form that cannot be handled by this theory.

Whatever its virtues or defects, Wyclif's theory had some influence on later authors. Robert Alyngton's own *Insolubilia,* for instance, from around 1380, explicitly appeals to Wyclif's theory. Its influence can also be seen in an anonymous late treatise preserved in a Prague manuscript. (See Wyclif 1984, pp. xxiv-xxv.)

4.2 Peter of Ailly

As already mentioned (Section 3.4 above), in 1372 the Frenchman Peter of Ailly (Petrus de Alliaco) wrote an *Insolubilia* that preserves all we know of Gregory of Rimini's theory. Peter's theory looks much like Gregory's. Nevertheless, he did not accept Gregory's view entirely. Whereas for Gregory, an insoluble in spoken or written language corresponds to or expresses a *conjunction* of two propositions in mental language, for Peter it corresponds to or expresses *two distinct* mental propositions, not their conjunction. (The two distinct mental propositions are the same two that Gregory had conjoined.)

In medieval semantics, propositions that correspond to two distinct mental propositions are ambiguous or equivocal. (Indeed, that is the medieval *account* of equivocation.) Thus, for Peter, insolubles in spoken or written language are strictly equivocal and do not have a single signification. In one sense (answering to the first of Gregory's conjuncts), they are true; in another sense (answering to Gregory's second conjunct), they are false. By contrast, for Gregory, insolubles are just false, not ambiguous at all; they correspond to a *single* false conjunction, one conjunct of which is true and the other false.

Peter's theory has the phenomenological advantage that it accounts for the psychological "flip-flop" sense we have when thinking about insolubles. When we look at them one way they seem true; when we look at them another way, they seem false. No other medieval theory seems to account for this psychological fact.

5. Observations

Several instructive observations can be made about the medieval *insolubilia*-literature.

First, although this article has focused on Liar-type paradoxes, and although the medieval literature did too, it also included other kinds of puzzles. For example, where *a* = ‘*b* is false’ and *b* = ‘*a* is false’, no Liar-type paradox arises; contradiction can be avoided by simply taking one of the two propositions as true and the other as false. But medieval logicians regarded such cases as problematic because they require us to assign different truth values to propositions that are semantically exactly alike; there is no

reason to pick *a* as the true proposition rather than *b* or conversely. Cases like this, which violate only a kind of semantic "principle of sufficient reason," were often included under the heading "insolubles." (For example, Buridan, *Sophismata* VIII.8.) A variety of epistemic and pragmatic puzzles were often included as well.[33] There is no attempt, as there sometimes is in present-day literature on the paradoxes, to ignore all the inessentials and focus in on a single paradigmatic case that gets at the kernel of the issue. For medieval authors, the issue was a broad one. They did not attempt to give any precise and rigorous characterization of what it takes to be an insoluble. The definitions they did give are quite general and include much more than Liar-type paradoxes. For instance, Bradwardine defines an insoluble as "a difficult paralogism *secundum quid et simpliciter*[34] arising from some [speech-] act's reflection on itself with a privative determination." (Spade 1975, p. 106.) Still, their discussions always tended to focus on Liar-type cases.

Second, medieval authors did not have any sense of theoretical "crisis" over insolubles, as modern discussions of the paradoxes often do. The medievals did not regard the paradoxes as threatening the very foundations of reasoning. On the contrary, most authors seem to have regarded them as merely argumentative nuisances, and their main concern was to come up with a way of dealing with them when they arise in disputation. No doubt this difference is due to the different contexts in which the discussions emerged. Modern logic is a formalized, axiomatic (or at any rate systematized) discipline, closely tied to the foundations of mathematics; medieval logic, by contrast, was much looser and informal (which of course is not to say it lacked insight), much more tied to the give and take of live academic disputation.

Third, and related to the second point, most medieval authors thought it was entirely possible to find a completely satisfactory "solution" to insolubles. There was no deep "lesson" to be learned about the nature of language or thought, about the limits of expressibility. Insolubles were thought of as resting on a straightforward but pernicious fallacy, although authors disagreed over just what the fallacy is. William of Ockham, for instance, writes, "As for insolubles, you should know it is not because they can in no way be solved that some sophisms are called insolubles, but because they are solved *with difficulty*." (Ockham, *Summa logicae* III-3, 46.)

The only medieval author who is known to have departed from this confident view is William Heytesbury, who raises objections against his own view, and then remarks (Heytesbury 1979, p. 45):

> Many objections of this sort can be raised against this view, which it would be difficult *or impossible* to answer to complete satisfaction.

Again, about his own view he says (p. 21):

> I do not claim that it or any [opinion] is altogether satisfactory, *because I do not see that this is possible.* Nevertheless I rate this one among all of them to be nearer the truth.

Richard Lavenham, an English contemporary of Wyclif, perhaps put the prevailing optimism best (Spade 1975, p. 93; Heytesbury 1979, p. 8):

> Just as the bond of love is sometimes called insoluble, not because it can in no way be untied (*sit solubilis*) but because it can be untied [only] with difficulty, so a proposition is sometimes called insoluble, not because it is not solvable but because it is solvable [only] with difficulty.

Bibliography

Primary Literature in Translation

- Anonymous (1964). *Treatise on Insolubles.* In *Peter of Spain: Tractatus syncategorematum and Selected Anonymous Treatises.* Joseph P. Mullally, trans. "Mediaeval Philosophical Texts in Translation," vol. 13. Milwaukee, Wis.: Marquette University Press, 1964. Among the "anonymous treatises" translated at the end of this volume is a late (probably fifteenth century) treatise on insolubles.
- Athenaeus of Naucratis (1927-41). *The Deipnosophists, with an English translation by Charles Burton Gulick.* "The Loeb Classical Library." Cambridge, Mass.: Harvard University Press, 1927-41.
- Buridan, John (1966). *Sophisms on Meaning and Truth.* Theodore Kermit Scott, trans. New York: Appleton-Century-Crofts, 1966. A translation of the ninth treatise of Buridan's *Sophismata.* Chap. 8 is on insolubles.
- Buridan, John (1982). *John Buridan on Self-Reference.* G. E. Hughes, ed. and trans. Cambridge: Cambridge University Press, 1982. A translation, with philosophical commentary, of Chap. 8 of Buridan's *Sophismata*, on insolubles. (The *Sophismata* is the ninth treatise in Buridan's *Summulae de Dialectica.*) [Note: There are two versions of this book, with different pagination. The paperbound publication has the subtitle: *Chapter Eight of Buridan's 'Sophismata', translated with an Introduction and a philosophical Commentary.* The hardbound publication includes a Latin edition, and has the slightly different subtitle: *Chapter Eight of Buridan's 'Sophismata', with a Translation, an Introduction, and a philosophical Commentary.*]
- Buridan, John (forthcoming). *Summulae de Dialectica.* Gyula Klima, trans. "Yale Library of Medieval Philosophy." New Haven, Conn.: Yale University Press, forthcoming.
- Heytesbury, William (1979). *On "Insoluble" Sentences: Chapter One of His Rules for Solving Sophisms.* Paul Vincent Spade, trans. "Mediaeval Sources in Translation," vol. 21. Toronto: Pontifical Institute of Mediaeval Studies, 1979.
- Peter of Ailly (1980). *Concepts and Insolubles: An Annotated Translation.* Paul Vincent Spade, trans. "Synthese Historical Library," vol. 19. Dordrecht: D. Reidel, 1980.

Primary Literature in the Original Languages

- Adam of Balsham (1956). *Adam Balsamiensis Parvipontani Ars Disserendi (Dialectica Alexandri).* Lorenzo Minio-Paluello, ed. "Twelfth Century Logic: Texts and Studies," vol. 1.

Rome: Edizioni di storia e letteratura, 1956.

- Anonymous (1971). *Insolubilia.* In Paul Vincent Spade, "An Anonymous Tract on *Insolubilia* from Ms Vat. lat. 674: An Edition and Analysis of the Text," *Vivarium* 9 (1971), pp. 1-18. The text comes from 1368.
- Augustine (1970). *Contra academicos, De beata vita, De ordine, De magistro, De libero arbitrio,* W. M. Green and K.-D. Daur, ed. "Corpus Christianorum." Turnholt: Brepols, 1970.
- Bricot, Thomas (1986). *Tractatus insolubilium.* E. J. Ashworth, ed. "Artistarium," vol. 6: Nijmegen: Ingenium, 1986. Bricot was a very late fifteenth century author.
- Buridan, John (1977). *Sophismata.* T. K. Scott, ed., "Grammatica Speculativa," vol. 1: Stutgart-Bad Cannstatt, 1977. The Latin edition that formed the basis for Scott's translation in Buridan (1966). A new critical edition is being prepared by Fabienne Pironet.
- Cicero (1966). *Academica.* James S. Reid, ed. Hildesheim: Georg Olms, 1966. (Photoreprint of the London 1885 edition.)
- Duns Scotus, John (1958). *Quaestiones super libro elenchorum.* In his *Opera omnia.* Luke Wadding, ed. Hildesheim: Georg Olms, 1958. (photoreprint of the edition Lyon: Laurentius Durand, 1639), vol. 1, pp. 268-69.
- Fland, Robert (1978). *Insolubilia.* In Paul Vincent Spade, "Robert Fland's *Insolubilia:* An Edition, with Comments on the Dating of Fland's Works," *Mediaeval Studies* 40 (1978), pp. 56-80. Fland wrote between 1335 and about 1370.
- Gellius, Aulus (1968). *Noctes Atticae.* P. K. Marshall, ed. 3 vols. Oxford: Clarendon Press, 1968.
- John of Holland (1985). *Four Tracts on Logic: Suppositiones, Fallacie, Obligationes, Insolubilia.* E. P. Bos, ed. "Artistarium," vol. 5. Nijmegen: Ingenium, 1985. Includes a Latin edition of a widely read text on insolubles.
- Laertius, Diogenes (1964). *Vitae philosophorum.* H. S. Long, ed. 2 vols. "Oxford Classical Tests." Oxford: Clarendon Press, 1964.
- Neckham, Alexander (1967). *De naturis rerum libri duo, with the Poem of the Same Author, De laudibus divinae sapientiae.* Thomas Wright, ed. "Rerum Britannicarum Medii Aevi Scriptores, or Chronicles and Memorials of Great Britain and Ireland during the Middle Ages (Rolls Series)," no. 34. London: Longman, Green, 1863. (Reprint Kraus reprints, 1967.)
- Ockham, William of (1974). *Summa logicae.* Gedeon Gál *et al.*, ed. St. Bonaventure, NY: The Franciscan Institute, 1974.
- Roure, Marie Louise Roure (1970). "La problématique des propositions insolubles au XIIIe siècle et au début du XIVe, suivie de l'édition des traités de W. Shyreswood, W. Burleigh et Th. Bradwardine." *Archives d'histoire doctrinale et littéraire du moyen age* 37 (1970), pp. 205-326. Latin editions of the treatises by Walter Burley and Thomas Bradwardine, as well as of a thirteenth century treatise sometimes attributed to William of Sherwood.
- Seneca (1965). *L. Annaei Senecae Ad Lucilium epistulae morales.* L. D. Reynolds, ed. 2 vols. Oxford: Clarendon Press, 1965.
- Swyneshed, Roger (1979). *Insolubilia.* In Paul Vincent Spade, ""Roger Swyneshed's *Insolubilia:* Edition and Comments," *Archives d'histoire doctrinale et littéraire du moyen age* 46 (1979), 177-220. Reprinted in Spade (1988).
- Wyclif, John (1893-99). *Tractatus de logica.* Michael Henry Dziewicki, ed. 3 vols. London: Trübner & Co., for the Wyclif Society, 1893-99. Includes his *Logicae continuatio.*

- Wyclif, John (1984). *Summa insolubilium.* Paul Vincent Spade and Gordon Anthony Wilson, ed. "Medieval & Renaissance Texts & Studies," vol. 41. Binghamton, N.Y.: Medieval & Renaissance Texts & Studies, 1984.

Secondary Literature

- Bottin, Francesco (1976). *Le antinomie semantiche nella logica medievale.* Padua: Antonore, 1976.
- Bottin, Francesco (1983). "The Mertonians' Metalinguistic Science and the *Insolubilia.*" In P. Osmund Lewry, ed., *The Rise of British Logic.* "Papers in Mediaeval Studies," vol. 7. Toronto: Pontifical Institute of Mediaeval Studies, 1983, pp. 235-48.
- De Rijk, L. M. (1962-67). *Logica Modernorum: A Contribution to the History of Early Terminist Logic.* Vol. 1: *On the Twelfth Century Theories of Fallacy.* Vol. 2: *The Origin and Early Development of the Theory of Supposition.* Assen: Van Gorcum, 1962-67. (Also contains many Latin editions of primary texts.)

Notes to Insolubles

Notes

1. Singular *insolubile,* with the stress on the antepenult.

2. "Eubulides the Milesian belongs to Euclides's school. He raised many arguments in dialectic: the Liar, the Unnoticed, Electra, the [Man] in a Veil, the Heap, the Horns, the Bald Head."

3. This delightful although rather free translation comes from Stock, 1908, p. 36. It is quoted in Mates 1961, p. 42.

4. Gellius's wording makes it likely that he intended a situation more like the one Aristotle discusses in *Sophistic Refutations* 25 (where someone first tells a lie, but then takes it back by revealing that his first statement was a lie) than a real Liar-type paradox. (For the diffeence, see Spade 1973 and section 1.3 below.) Still, Gellius's words might have been enough to suggest the Liar paradox to a medieval logician, if only they had been read.

5. Spade 1973, p. 296 n. 24. It is sometimes observed that Epimenides's statement is not really a paradox of the Liar type at all. If he did say "The Cretans [i.e., *all* Cretans] are *always* liars, evil beasts, slow bellies," then his statement is true only if it is false, since he himself is a Cretan and so always lying. Thus it cannot be true. But if it is false, all that follows is that *some* Cretans are not *always* liars and evil beasts and slow bellies. It does *not* follow that Epimenides's own remark is not a lie, and so it does not follow that it is not false. Hence there is no real paradox at all; Epimenides's statement is just false. This much is correct about what *Epimenides* said. But *St. Paul* (or whoever wrote the epistle) goes on to say in the very next verse (Titus 1:13) "This witness is *true*." Hence there was ample opportunity for a reader of this text to be introduced to the Liar Paradox, even if he did not already know about it.

6. For details of the points made in this paragraph, see Spade 1973.

7. Particularly the second proposition, with the important words ‘nothing but’. These words indicate a proposition that cannot be cast in the mold of Aristotle's oath-breaker.

8. It is worth noting that Neckham had studied at the Petit Pont, at the logical school founded by Adam of Balsham.

9. De Rijk 1962-67, II.2, p. 594:30-31. The *Munich Dialectic's* "treatise on insolubles" is now lost. This

occurrence of the word ‘insolubles’ is the first known use of the term in its technical sense.

10. Thus, the third view in Bradwardine's survey tries to fit the paradox into the Aristotelian fallacy of "false cause." The seventh view, interestingly enough from a present-day perspective, denies bivalence for insolubles; they are neither true nor false. Certain authors after Bradwardine likewise refer to the latter view, although no text has been found, from before or after Bradwardine, that actually maintains it as a general claim about insolubles. (But see n. 12 below. In the first half of the 1330s, Roger Swyneshed did allow failure of bivalence in certain special cases of insolubles. See Spade 1983, and section 3.2 below.)

11. For references, and for another example, see Spade 1987, p. 32 n. 46.

12. It is possible that these are the authors Bradwardine refers to as denying bivalence. (See n. 10 above.) But this is uncertain.

13. For details of claims in this paragraph, see Spade 1987, pp. 32-33.

14. Medieval logicians typically held that affirmative propositions with non-denoting subject terms are false, not meaningless or without truth value, as is sometimes held nowadays.

15. For more on this theory, and for some very tentative speculations on its motivation, see Spade 1987, pp. 33-36.

16 . Not surprisingly, given that the discussion occurs in a set of questions on the *Sophistic Refutations*, Scotus applies this distinction within the context of the Aristotelian fallacy *secundum quid et simpliciter*. Bradwardine interprets the theory in a way that commits it to *transcasus* as well, although Scotus's own text does not seem committed to that. It may be that Bradwardine is not thinking of Scotus in particular when he mentions this theory, and in any event Scotus himself makes it plain that the theory is not original with him. For more on the theory, see Spade 1987, pp. 36-38.

17. This objection does not seem to have been raised in the Middle Ages, even by authors like Bradwardine who opposed all forms of restriction. (See Spade 1975, p. 106.) This is probably to be explained by the fact that medieval authors on the whole do not seem especially concerned with a theoretical understanding of the paradoxes; they are much more concerned with knowing what to do with them when they arise in argumentation. See section 5 below. On the theory of restriction, see Spade 1987, pp. 38-42.

18. Later authors express this objection more clearly, if no more successfully. Bradwardine, for example, remarks that Socrates says letters (i.e., phonemes), syllables, words and a sentence, and so does not say "nothing." The objection, therefore, confuses "saying" with "uttering." (See Spade 1975, item LXIV, p. 107.) On the theory of cassation, see Spade 1987, pp. 43-45.

19. Bradwardine himself does not state this general claim, but it is easy enough to show that it follows from his semantics. (See the proof in the supplementary document A Proof Concerning Bradwardine's Theory.) The general claim greatly simplifies his own complicted presentation of his theory. See Spade 1981, especially pp. 123-25. A great many later authors did explicitly maintain the general claim.

20. Variations on Bradwardine's theory, sometimes combined with elements from other views, were held by several anonymous authors (see Spade 1975, items IV, VIII and XII), as well as by Albert of Saxony, Henry Hopton, John Buridan, John of Holland, John Huntman (*or* Venator), Paul of Pergula, Ralph Strode, Richard Lavenham, and Robert Fland. See Spade 1975, and Spade 1981, p. 123 n. 32.

21. For a discussion of these matters, see Spade 1981, especially pp. 125-34.

22. For a discussion of these notions and some of the complications with them, see Spade 1983.

23. Bradwardine would have agreed with this conclusion as stated. But whereas for Bradwardine insolubles *also* signify otherwise than is the case, Swyneshed does not seem to have a notion of any *additional* signification of a proposition. Thus, his first conclusion amounts to saying that some false propositions signify *only* as is the case. Bradwardine certainly would not have agreed with *that*.

24. Note that Swyneshed is here taking the notion of "contradictories" as a syntactical notion, so that it in effect means "a proposition and its negation." Other authors had an Aristotelian, semantic notion of contradictories, according to which contradictories are propositions that cannot be either true together or false together but must have opposite truth values. But Swyneshed's third conclusion is striking, whether put in terms of "contradictories" or in terms of a proposition and its negation.

25. For some of the parties in the controversy, see Spade 1975, the anonymous item III, as well as the entries there for Anthony de Monte, John of Wesel, Paul of Pergula, the *Logica magna* attributed to Paul of Venice, Robert Fland, Roger Roseth, and William Heytesbury.

26. If we push the point, and ask not whether *a* in this situation is true or false, but whether it signifies as is the case or does not, Swyneshed explicitly says it does not. Nevertheless, it is not clear what prevents our paradoxically inferring from this that, yes, *a* does signify as is the case after all. In other words, what is to prevent our *reconstructing*, in terms of the notion of "signifying as is the case" alone, the paradoxes that arise about truth when truth is identified with signifying as is the case? Swyneshed does discuss the issue, but his reasoning is obscure. (See Spade 1983, pp. 107-08.)

27. ‘Sophisms’ here does not mean "sophistry" in the modern, pejorative sense, but rather puzzle-propositions the study of which illustrates various logical points. Good modern examples might be Frege's "The morning star is the evening star," or Russell's "The present king of France is bald."

28. Heytesbury may win the competition. See Spade 1975, the anonymous items V, VII, VIII, XII, XIII, XXIII, and the entires there for Angelo of Fossombrone, Gaetano di Thiene, John of Constance, John Dumbleton, John of Holland, John Hunter (Huntman, Venator), John of Wesel, John Wyclif, Paul of Pergula, the *Logica magna* attributed to Paul of Venice, Ralph Strode, and Robert Fland.

29. For a discussion of some of the possibilities, see Spade 1982b.

30. See Spade 1975, the anonymous items VII and XII, and the entries there for John of Holland and John Hunter (Huntman, Venator).

31. On the notion of "mental language," see Spade, *Thoughts, Words and Things*.

32. There is some dispute over the authenticity of this work. Still, the theory is genuinely Wyclif's, even if this text is not. See the discussion in Wyclif 1984, xxiii-xxviii.

33. For example, Buridan, *Sophismata* VIII.13, concerns the ingenious proposition ‘Socrates knows the proposition written on the wall to be doubtful to him’, where it is supposed that this proposition is the only proposition written on the wall, that Socrates sees it and is in a state of doubt about its truth, and furthermore *knows* he is in that state of doubt. Is the proposition true or not? Since it is stipulated that Socrates does know that he doubts the proposition, it would seem to be true. But how can Socrates simultaneously know and doubt the same proposition? Again (VIII.18), Socrates wants to eat if and only if Plato wants to eat, since Socrates likes company at meals. But Plato is angry at Socrates and, out of perverse spite, wants to eat if and only if Socrates does *not* want to eat. Does Socrates want to eat or not? The literature abounds in such delightful examples.

34. Despite this lip-service to the Aristotleian fallacy, we saw in section 3.1 that the core of Bradwardine's solution is quite different.

Robert Alyngton

Robert Alyngton was one of the most important authors of the generation after John Wyclif. He was deeply influenced by Walter Burley's logico-ontological system and Wyclif's metaphysics. (His major extant work, a commentary on the *Categories,* heavily depends on Burley's last commentary on the *Categories* and Wyclif's *De ente praedicamentali.*) Yet he was able to develop new logical and semantic theories as well as the general strategy adopted by the Oxford Realists, as he methodically substituted reference to external objective realities for reference to linguistic and/or mental activities.

Life and Works

Not a great deal is known of Robert Alyngton's life. Most of the information about him comes from Emden 1957-59. From 1379 until 1386, he was fellow of Queens College (the same Oxonian college where Wyclif started his theological studies in 1363 and Johannes Sharpe taught in the 1390s); he became *Magister Artium* and, by 1393, doctor of theology. He was chancellor of the University in 1393 and 1395. In 1382 he preached Wyclif's religious and political ideas in Hampshire (McHardy 1987). He was rector of Long Whatton, Leicestershire, where he died by September 1398.

According to Emden 1957-59 and Ashworth & Spade 1992, Alyngton was of considerable repute as a logician. Among his extant works, the following can be mentioned (the most complete list of his writings is found in Bale 1557-59 [pp. 519-20]):

- A commentary on Aristotle's *Categories* (*Litteralis sententia super Praedicamenta Aristotelis*

[henceforward *In Cat*.]), partially edited in Conti 1993 (pp. 242-306). (All references are to the pages of this edition or, for the unedited portions, to the ms. London, Lambeth Palace 393.)

- A treatise on the supposition of terms (*Tractatus de suppositionibus terminorum*).
- A commentary on the *Liber sex principiorum*.
- A treatise on the genera of being (*Tractatus generum*).

Being and Categories

Like Burley, Alyngton affirms that (i) the division into categories is first of all a division of things existing outside the mind, and only secondarily of the mental concepts and spoken or written terms which signify them, and (ii) things belonging to one categorial field are really distinct from those belonging to another -- for instance, substances are really distinct from quantities, qualities, and relations, quantities are really distinct from substances, qualities, and relations, and so on (*In Cat*., Conti pp. 251, 252-53).

As far as the problem of the relationship of the ten categories to being is concerned, Alyngton does not follow Burley but Wyclif, since he hypostatises the notion of being and considers equivocity, analogy, and univocity not only as semantic relations between terms and things, but also as real relations between extrametal objects (*In Cat*., ms. London, Lambeth Palace 393, ff. 69v-70r). According to the common interpretation of the opening passage of the *Categories*, equivocal terms are correlated with more than one concept and refer to a multiplicity of things sharing different natures, whereas univocal terms are correlated with only one concept and refer to a multiplicity of things sharing one and the same nature. Within Alyngton's system, what differentiates analogy from univocity is the way in which a certain nature (or property) is shared by a set of things: analogous things share it according to different degrees (*secundum magis et minus*, or *secundum prius et posterius*), univocal things share it all in the same manner and to the same degree (*In Cat*., pp. 255-256). Alyngton admits four main types of equivocity: by chance, deliberate, analogical, and generic. Equivocals by chance are those things to which it just happens that they have the same name, but with different meanings and/or reasons for imposing the name. Those things are deliberate equivocals which have distinct natures but the same name, and are subordinated to different but correlated concepts. Those things are analogical which share the nature signified by their common name in various degrees and/or ways. Generic equivocals are those things which share the same generic nature in the same way, but have distinct specific natures of different absolute value (*In Cat*., f. 70r). According to this account, being is a sort of basic component of the metaphysical structure of each reality, which posses it in accordance with its own nature, value, and position in the hierarchy of created beings.

Universals and Predication

Alyngton recognizes three main kinds of universals:

1. *ante rem* or ideal universals -- that is, the ideas in God, the archetypes of all that is;

2. *in re* or formal universals -- that is, the common natures shared by individual things; and
3. *post rem* or intentional universals -- that is, mental signs of the formal universals.

The ideas in God are the causes of formal universals, and formal universals are the causes of intentional universals. Furthermore, like Burley and Wyclif, Alyngton holds that formal universals actually exist (*in actu*) outside our minds, and not potentially only (*in potentia*) as moderate realists thought (*In Cat*., p. 279) -- even if, unlike Burley (the *Doctor Planus et Perspicuus*), he maintains they are really identical with their individuals, for otherwise it would be impossible to explain, against the Nominalists, why and how individual substances show different and more or less close kinds of similarity among themselves (*In Cat*., pp. 267-68).

According to Alyngton, who depends here on Avicenna and Wyclif, formal universals are common natures in virtue of which the individuals that share them are exactly what they are -- as the human species is the form by which every man formally is a man. *Qua* natures, they are prior, and so indifferent, to any division into universals and individuals. Universality (*universalitas* or *communicabilitas*) is as it were their inseparable property, but not a *constitutive* mark of the nature itself (*In Cat*., f. 101v). As a consequence, formal universals can be conceived of in two different manners: as first intentions or as second intentions. In the former case, they are natures of a certain kind and are identical with their individuals (for example, man is the same thing as Socrates). In the latter case, they are properly universals (that is, something that can exist in many things and can be shared by them), and are distinct from their individuals considered *qua* individuals, because of opposite constitutive principles (*In Cat*., p. 268). Therefore, universals are really (*realiter*) identical to, but formally (*formaliter*) distinct from their individuals. In fact, universals are formal causes in relation to their individuals, and individuals are material causes in relation to their universals. Thus three different kinds of entities can be qualified as formal universals:

1. the common natures instantiated by individuals -- which are things of first intention;
2. the form itself of universality, which belongs to a certain common nature when seen in its relation to the individuals -- which is a thing of second intention; and
3. the thinkability proper to the common nature, by which it is a possible object of our mind -- that is, the real principle that connects formal universals with mental universals (*In Cat*., p. 277).

Alyngton accepts the traditional realistic account of the relationship between formal universals and individuals, and, like Wyclif, improves it by defining its logical structure more accurately. Alyngton thought that a universal of the category of substance could directly receive only the predications of substantial forms more common than itself. On the other hand, accidental forms inhering in substantial individuals could be predicated only indirectly (*essentialiter*) of the substantial form itself that those individuals instantiate, predicated indirectly through and in virtue of the individuals of that substantial form. So his description of the logical structure of the relationship between universals and individuals demanded a redefinition of predication. Alyngton was probably the first to ameliorate Wyclif's theory of predication by dividing predication into formal predication (*praedicatio formalis*) and remote inherence (*inhaerentia remota*) or predication by essence (*praedicatio secundum essentiam*). Remote inherence is grounded in a partial identity between subject and predicate, which share some but not all metaphysical

constituents, and does not demand that the form signified by the predicate term be directly present in the entity signified by the subject term. On the other hand, such a direct presence is needed by formal predication. "Man is an animal" and "Socrates is white" are instances of formal predication; "(What is) singular is (what is) common" (*singulare est commune*) and "Humanity is running" (*humanitas est currens*) are instances of remote inherence, as according to Alyngton it is possible to attribute the property of being running to the form of humanity if at least one man is running. However, he makes sure to use as a predicate term a substantival adjective in its neuter form, because only in this way can it be made apparent that the form signified by the predicate term is not directly present in the subject, but is indirectly attributed to it, through its individuals (*In Cat*., pp. 288-90).

The Theory of Relations

Aristotle's treatment of relations in the *Categories* and in the *Metaphysics* is opaque and incomplete. Because of this fact, in Late Antiquity and the Middle Ages many authors tried to reformulate the doctrine of relatives. Alyngton's attempt is the most interesting among those of the Late Middle Ages, as he was the only one able to work out a concept of relation conceived of as an accidental form which is in both the relatives at once, even if in different ways (*In Cat*., p. 296). Consequently his notion of relation can be considered the ontological equivalent to our modern functions with two variables, or two-place predicates, whereas all other authors of the Middle Ages had thought of relations in terms of monadic functions.

According to Alyngton, whose account partially differs from those of Burley and Wyclif, in the act of relating one substance to another four distinct constitutive elements can be singled out:

1. the relation itself -- for instance, the form of paternity;
2. the substrate of the relation, that is, the substance that denominatively receives the name of the relation -- for instance, the (substance that is the) father;
3. the object of the relation, that is, the substance the substrate of the relation is connected with -- for instance, the (substance that is the) son; and
4. the foundation (*fundamentum*) of the relation, that is, the absolute entity in virtue of which the relation inheres in the substrate and in the object (*In Cat*., p. 299).

The foundation is the main component, since it (i) joins the relation to the underlying substances, (ii) lets the relation link the substrate to the object, and (iii) transmits some of its properties to the relation. Unlike Burley and Wyclif, Alyngton affirms that not only qualities and quantities, but substances too can be the foundation of a relation (*In Cat*., p. 291).

On this basis, Alyngton can define relations of reason while eliminating from their description any reference to our mind and using objective criteria only, based on the framework of reality itself. In fact, he maintains that what characterizes relations of reason is the fulfillment of at least one of these conditions: (i) either the rrelation's subject of inherence or its object is not a substance; (ii) the object is not an actual entity; (iii) the foundation of the relation is not an absolute being -- that is. a substance, a

quantity, or a quality (*In Cat*., pp. 291-92, and 294-95).

The Semantics of Second Intentions

Not until the end of the fourteenth century did anyone claim extramental reality for second intentions, not even Walter Burley. According to him, second intentions are concepts that have a foundation in the extramental world, but are not "things" in the proper sense of the term. This account implied that the keystone of medieval realism, the principle of one-to-one correspondence between language and the world, has to suffer an exception, since no common nature matches second intention terms. It was just in order to do away with this exception that Alyngton (then followed by William Penbygull, Roger Whelpdale, and John Tarteys) hypostatized second intentions, heavily modifying the standard theory of the status of second intentions. In fact, Alyngton not only considers second intentions as objective, but clearly hypostatizes them, speaking of them in terms of real determinations joined to the modes of being of extramental things and directly inhering in them (*In Cat*., pp. 268-69). As a consequence, he conceives of logic as an analysis of the general framework of reality, since according to him logic turns on structural forms (aimed at building up semantic contents), which are, as forms, independent of both such contents and of the mental acts by which they are learned. It is through these forms that the network connecting the basic constituents of the world (individuals and universals, substances and accidents) is disclosed to us (*In Cat*., pp. 278-79). The strategy that supports this choice is evident: as in the case of relations of reason, Alyngton is trying to substitute references to external reality for references to mental activity. In other words, he seeks to reduce epistemology to ontology. From a logical point of view, this means that the same interpretative pattern is employed in order to account for both the semantic power of proper names and common terms (that is, those expressions that refer to a class of individuals), and first and second intentions. Like proper names, common terms also primarily signify and label a unique object -- that is, a common nature. But unlike the object signified by a proper name, the reality of the common nature is distributed among many individuals as their main metaphysical constituent, since it determines the typical features of the individuals themselves. By associating common terms with such objects as their main referent, Alyngton thinks he can explain the fact that a common term can stand for and label many individuals at once. Only in this way does he believe we can grant the value of our knowledge, which otherwise lacks an adequate foundation (*In Cat*., ff. 101v-102v).

Still, this procedure, so strong and powerful, leads to a paradox when applied to terms of second intention by which we speak of singular objects considered as such -- that is, terms (or expressions) like ‘first substance’ (*substantia prima*), ‘individual’ (*individuum*), and so on. In fact, according to Alyngton (and many other Realists of that period), a common term is always matched by a common nature really existing in the world. Therefore, as the term ‘individual’ appears to be common, since it can stand for a multiplicity of things, it should signify an extramental common nature shared by them. As a consequence, we would have to admit the existence of an *individual common nature*, that is a (self-contradictory) entity present in all the individuals as the cause of their being individuals. Alyngton, who would not give up the principle of the one-to-one relation between philosophical language and the world, could remove this paradox only by classifying this kind of term among atomic (*discreti*) terms -- that is, terms or nominal syntagms, like ‘Socrates’ or ‘this man’ (*hic homo*), that refer to individuals and not to

sets of individuals. According to Alyngton, there are three main kinds of atomic terms:

1. personal pronouns, which identify a singular definite referent by means of an ostensive definition (*a demonstratione*);
2. proper names; and
3. range-narrowed expressions (*a limitatione intellectus*) -- that is, expressions, like ‘this man’, that identify a singular referent as a member of a given (manifested) set of individuals. Also expressions like ‘first substance’ and ‘individual’ belong to this third type, since they presuppose a general concept (substance and being, in the example), the range of which is narrowed to a unique object among substances and beings by an act of our intellect -- to one object that is not common (*In Cat*., pp. 270-71).

The rule that terms can be listed as common ones if and only if they signify a common nature is safe, but at the cost of a counterintuitive categorization of their semantic power. In fact, according to Alyngton's account, saying that Socrates and Plato are first substances simply means that (i) each one is what he is, and that (ii) what each one is is a non-universal substance. This is a solution that entails that to be an individual is not a positive state of affairs, but a negative one, and therefore connects Alyngton's ontology with Henry of Ghent's theory of individuation.

John Wyclif

John Wyclif (ca. 1330-84) was one of the most important and authoritative thinkers of the Middle Ages. His activity is set in the very crucial period of late Scholasticism, when the new ideas and doctrines there propounded accelerated the transition to the modern way of thought. On the one hand, he led a movement of opposition to the medieval Church and to some of its dogmas and institutions, and was a forerunner of the Reformation; on the other, he was also the most prominent English philosopher of the second half of the 14th century. His logical and ontological theories are, at the same time, the final result of the preceding realistic tradition of thought and the starting-point of the new forms of realism at the end of the Middle Ages, since many authors active during the last decades of the 14th and/or the first decades of the 15th centuries (Robert Alyngton, William Penbygull, Johannes Sharpe, William Milverley, Roger Whelpdale, John Tarteys, and Paul of Venice), were heavily influenced by his metaphysics and largely used his logical apparatus. However, his philosophical system, rigorous in its general design, contains unclear and aporetic points that his followers attempted to remove. So, although an influential thinker, Wyclif *pointed to* the strategy the Realists at the end of the Middle Ages were to adopt, rather than fully developed it.

1. Life and Works

1.1 Life

John Wyclif was born near Richmond (Yorkshire) before 1330 and ordained in 1351. He spent the greater part of his life in the schools at Oxford: he was fellow of Merton in 1356, master of arts at Balliol

in 1360, and doctor of divinity in 1372. He definitely left Oxford in 1381 for Lutterworth (Leicestershire), where he died on 31 December, 1384. It was not until 1374 (when he went on a diplomatic mission to Bruges) that Wyclif entered the royal service, but his connection with John of Gaunt, Duke of Lancaster, probably dates back to 1371. His ideas on lordship and church wealth, expressed in *De civili dominio* (*On Civil Dominion*), caused in 1377 his first official condemnation by the Pope (Gregory XI), who censured nineteen articles. As has been pointed out (Leff 1967), in 1377-78 Wyclif made a swift progression from unqualified fundamentalism to a heretical view of the Church and its Sacraments. He clearly claimed the supremacy of the king over the priesthood (see for instance his *De ecclesia* [*On the Church*], between early 1378 and early 1379), and the simultaneous presence in the Eucharist of the substance of the bread and the body of Christ (*De eucharistia* [*On the Eucharist*], and *De apostasia* [*On Apostasy*], both ca. 1380). His theses would influence Jan Hus and Jerome of Prague in the 15th century. So long as he limited his attack to abuses and the wealth of the Church, he could rely on the support of a (more or less extended) part of the clergy and aristocracy, but once he dismissed the traditional doctrine of transubstantiation, his (unorthodox) theses could not be defended any more. Thus in 1382 Archbishop Courtenay had twenty-four propositions that were attributed to Wyclif condemned by a council of theologians, and could force Wyclif's followers at Oxford University to retract their views or flee. The Council of Constance (1414-18) condemned Wyclif's writings and ordered his books burned and his body removed from consecrated ground. This last order, confirmed by Pope Martin V, was carried out in 1428.

The most complete biographical study of Wyclif is still the monograph of Workman 1926, but the best analysis of his intellectual development and of the philosophical and thelogical context of his ideas is Robson 1961.

1.2 Works

Wyclif produced a very large body of work, both in Latin and English, a great portion of which has been edited by the Wyclif Society between the end of the 19th and the beginning of the 20th centuries, even though some of his most important books are still unpublished -- for instance, his treatises on time (*De tempore*) and on divine ideas (*De ideis*). W. R. Thomson 1983 wrote a full bibliography of Wyclif's Latin writings, among which the following can be mentioned: *De logica* (*On Logic* -- ca. 1360); *De ente in communi* (*On Universal Being* -- ca. 1365); *De ente primo in communi* (*On Primary Being* -- ca. 1365); *Purgans errores circa universalia in communi* (*Amending Errors about Universals* -- between 1366 and 1368); *De ente praedicamentali* (*On Categorial Being* -- ca. 1369); *Tractatus de universalibus* (*Treatise on Universals* -- ca. 1368-69 according to Thomson 1983, but between 1373 and 1374 according to Mueller 1985); *De materia et forma* (*On matter and form* -- between late 1370 and early 1372 according to Thomson 1983, but about 1374-75 according to Mueller 1985). Many of these treatises were later arranged as a *Summa*, called *Summa de ente* (*Summa on Being*), in two books, containing seven and six treatises respectively. (On the genesis, nature, structure, and tasks of this work see Robson 1961, pp. 115-40.)

2. Logic

2.1 Some preliminary remarks

Late medieval Nominalists, like Ockham and his followers, drew a distinction between things as they exist in the extra-mental world and the schemata by means of which we think of and talk about them. While the world consists only of two genera of individuals, substances and qualities, the concepts by which they are grasped and expressed are universal and of ten different types. Nor do the relations through which we connect our notions in a proposition analytically correspond to the real links that join individuals in a state of affairs. Thus, our conceptual forms do not coincide with the elements and structures of reality, and our knowledge does not reproduce its objects but merely *regards* them.

Wyclif maintained that such an approach to philosophical questions was misleading and deleterious. Many times in his works he expressed the deepest hostility to such a tendency. He thought that only on the basis of a close isomorphism between language and the world could the signifying power of terms and statements, the possibility of definitions, and finally the validity and universality of our knowledge be explained and ensured. So the nucleus of his metaphysics lies in his trust in the scheme *object-label* as *the* general interpretative key of every logico-epistemological problem. He firmly believed that language was an ordered collection of signs, each referring to one of the constitutive elements of reality, and that true (linguistic) propositions were like pictures of those elements' inner structures or/and mutual relationships. From this point of view, universals are conceived of as the real essences common to many individual things, which are necessary conditions for our language to be significant. Wyclif thought that by associating common terms with such universal realities the fact could be accounted for that each common term can stand for many things at once and can label all of them in the same way.

This conviction explains the main characteristic of his philosophical style, to which all his contributions can be traced back: a strong propensity towards hypostatisation. Wyclif methodically replaces logical and epistemological rules with ontological criteria and references. He thought of logic as turning on structural forms, independent of both their semantic contents and the mental acts by which they are grasped. It is through these forms that the network connecting the basic constituents of the world (individuals and universals, substances and accidents, concrete properties, like being-white, and abstract forms, like whiteness) is disclosed to us. His peculiar analysis of predication and his own formulation of the Scotistic formal distinction are logically necessary requirements of this philosophical approach. They are two absolute novelties in late medieval philosophy, and certainly the most important of Wyclif's contributions to the thought of his times.

Wyclif's last formulation of the theory of difference and his theory of universals and predication are linked together, and rest upon a sort of componential analysis where things substitute for lexemes and ontological properties for semantic features. Within Wyclif's world, difference (or distinction) is defined in terms of partial identity, and is the main kind of transcendental relation holding among the world's objects, since in virtue of its metaphysical composition everything is at the same time partially identical to and different from any other. When the objects at issue are categorial items, and among what differentiates them is their own individual being, the objects differ *essentially*. If the objects share the

same individual being and what differentiates them is (at least) one of their *concrete* metaphysical components (or features), then the objects differ *really*, whereas if what differentiates them is one of their *abstract* metaphysical components, then they differ *formally*. Formal distinction is therefore the tool by means of which the dialectic of one-many internal to the world's objects is regulated. It explains why one and the same thing is at the same time an atomic state of affairs and how many different beings can constitute just one thing.

2.2 The formal distinction

Wyclif explains the notion of formal distinction (or difference) in the *Purgans errores circa universalia in communi* (chap. 4, p. 38) and in the later *Tractatus de universalibus*. (On Wyclif's formulation of the formal distinction see Spade 1985, pp. xx-xxxi, and Conti 1997, pp. 158-63.) The two versions differ from each other on some important points, and are both unsatisfactory, since Wyclif's definitions of the different types of distinction are rather ambiguous.

In the *Tractatus de universalibus* (chap. 4, pp. 90-92), Wyclif lists three main kinds of differences (or distinctions):

- real-and-essential;
- real-but-not-essential; and
- formal (or notional).

He does not define the real-and-essential difference, but identifies it through a rough account of its three sub-types. The things that differ really-and-essentially are those that differ from each other either (i) in genus, like man and quantity, or (ii) in species, like man and donkey, or (iii) in number, like two human beings.

The real-but-not-essential difference is more subtle than the first kind, since it holds between things that are the same single essence but really differ from each other nevertheless -- like memory, reason, and will, which are one and the same soul, and the three Persons of the Holy Trinity, who are the one and same God.

The third main kind of difference is the formal one. It is described as the difference by which things differ from each other even though they are constitutive elements of the same single essence or supposit. According to Wyclif, this is the case for:

1. the concrete accidents inhering in the same substance, since they coincide in the same particular subject but differ from each other because of their own natures;
2. the matter and substantial form of the same individual substance;
3. what is more common in relation to what is less common, like (*a*) the divine nature and the three Persons, (*b*) the world and this world; and, (*c*) among the categorial items belonging to the same category, a superior item and one of its inferiors.

This account of the various kinds of distinctions is more detailed than that of the *Purgans errores circa universalia in communi*, but not more clear. What is the difference, for instance, between the definition of the real-but-not-essential distinction and the definition of the formal distinction? What feature do all the kinds of formal distinction agree in? Some points are obvious, however:

1. The real-and-essential distinction matches the traditional real difference.
2. The real-but-not-essential distinction and the first sub-type of the formal distinction (that is, the distinction that holds between two or more concrete accidents belonging to the same individual substance) are two slightly different versions of the Scotistic formal distinction as defined in Scotus' *Lectura* (book I, d. 2, p. 2, qq. 1-4, ed. Vaticana, vol. xvi, p. 216) and *Ordinatio* (book I, d. 2, p. 2, qq. 1-4, ed. Vaticana, vol. ii, pp. 356-57; book II, d. 3, p. 1, q. 6, ed. Vaticana, vol. vii, pp. 483-84).
3. The third sub-type of the formal distinction is a reformulation of the Scotistic formal distinction as described in Scotus' *Reportata Parisiensia* (book I, d. 33, qq. 2-3, and d. 34, q. 1, ed. Vivès, vol. xxii, pp. 402-8, 410).

The main apparent dissimilarities between the analyses proposed in the *Tractatus de universalibus* and in the *Purgans errores circa universalia in communi* are the following:

1. There are three main kinds of differences instead of two.
2. Notwithstanding the presence of the qualification ‘real’, the real-but-not-essential difference in the *Tractatus de universalibus* is closer to the formal difference than is the corresponding kind of difference in the *Purgans errores circa universalia in communi,* since in the former the term ‘essence’ has the technical meaning of real entity with a given nature, and so is equivalent to ‘thing’.
3. The difference between the matter and the substantial form of the same individual substance is seen as a sub-type of real difference in the *Purgans errores circa universalia in communi* and as a sub-type of formal distinction in the *Tractatus de universalibus.*

2.3 The analysis of predication

Wyclif presents his opinion on universals as intermediate between those ones of St. Thomas (and Giles of Rome) and Walter Burley. Like Giles, whom he quotes by name, Wyclif recognizes three main kinds of universals:

1. *ante rem*, or ideal universals; that is, the ideas in God, archetypes of all that there is;
2. *in re*, or formal universals; that is, the common natures shared by individual things; and
3. *post rem*, or intentional universals; that is, mental signs by which we refer to the universals *in re.*

The ideas in God are the causes of the formal universals, and the formal universals are the causes of the intentional universals. On the other hand, like Burley, Wyclif holds that formal universals exist *in actu*

outside our minds, not *in potentia* as moderate Realists thought -- even though, unlike Burley, he maintains they are really identical with their own individuals. So Wyclif accepts the traditional realistic account of the relationship between universals and individuals, but translates it into the terms of his own system. According to him, universals and individuals are *really* the same, but *formally* distinct, since they share the same empirical reality (that of individuals) but, considered as universals and individuals, they have opposite constituent principles. On the logical side, this means that, notwithstandig real identity, not all that is predicated of individuals can be *directly* predicated of universals or *vice versa*, though an indirect predication is always possible. Hence Wyclif's description of the logical structure of the relationship between universals and individuals demanded the introduction of a new kind of predication, unknown to Aristotle, to cover cases, admitted by the theory, of indirect inherence of an accidental form in a substantial universal and of one second intention in another.

Therefore Wyclif distinguished three main types of predication, which he conceived as a real relation that holds between metaphysical entities. (On Wyclif's theory of predication, see Spade 1985, pp. xxxi-xli, and Conti 1997, pp. 150-58.)

In the *Purgans errores circa universalia in communi* (chap. 2), the three main types of predication are the following: formal predication, essential predication, and causal predication. In the *Tractatus de universalibus* (chap. 1, pp. 28-37), causal predication has been replaced by habitudinal predication -- a kind of predication that Wyclif had already recognized in the *Purgans errores circa universalia in communi,* but whose position within the main division of types of predication was not clear. In the *Tractatus de universalibus*, formal predication, essential predication, and habitudinal predication are described as three non-exclusive ways of predicating, each more general than the preceding. We speak of causal predication when the form designated by the predicate term is not present in the entity signified by the subject term, but is something caused by that entity. No instances of this kind of predication are given by Wyclif. Formal predication, essential predication, and habitudinal predication are defined in almost the same way in the *Purgans errores circa universalia* and in the *Tractatus de universalibus.*

Formal predication is that in which the form designated by the predicate term is directly present in the entity signified by the subject term. This happens whenever an item in the categorial line is predicated of something inferior, or an accident is predicated of its subject of inherence. In fact, in both cases, the subject term and the predicate term refer to the same reality in virtue of the form connoted by the predicate term itself.

To speak of essential predication, it is sufficient that the same empirical reality is both the real subject and the predicate, even though the formal principle connoted by the predicate term differs from that connoted by the subject term. ‘God is man’ and ‘The universal is particular’ are instances of this kind of predication. In fact, the same empirical reality (or essence) that is a universal is also an individual, but the forms connoted by the subject term and by the predicate term differ from each other.

Finally we speak of habitudinal predication when the form connoted by the predicate term does not inhere, either directly or indirectly, in the essence designated by the subject, but simply implies a relation to it, so that the same predicate may be at different times truly or falsely spoken of its subject without

there being any change in the subject itself. According to Wyclif, we use such a kind of predication mainly when we want to express theological truths, like: God is known and loved by many creatures, and brings about, as efficient, exemplar, and final cause, many good effects. It is evident that habitudinal predication does not require any kind of identity between the entity signified by the subject term and the entity signified by the predicate term, but formal predication and essential predication do. So the ontological presuppositions of the most general type of predication, implied by the other types, are completely different from those of the other two.

The final result of Wyclif's revolution is therefore a not fully developed system of intensional logic, which he superimposes on the standard extensional system inherited from Aristotle. As a result, the copula of the philosophical propositions that are dealt with cannot be extensionally interpreted, since it does not properly mean that a given object is a member of a certain set or that a given set is included in another; rather it means degrees of identity. Only in virtue of renouncing any extensional approach to the matter were Wyclif's followers able to give a logically satisfactory solution of the problem of the relationship between universals and individuals, which had always been the most difficult issue for medieval Realists.

Metaphysics

3.1 Being and analogy

The point of departure for Wyclif's metaphysics is the notion of being, since it occupies the central place in his ontology. After Duns Scotus, the real issue for metaphysics was the relationship between being and, on the other side, God and creatures, as Scotus' theory of the univocity of the concept of being was an absolute novelty, full of important consequences for the development of later medieval philosophy. Wyclif takes many aspects from Scotus' explanation, but strongly stresses the ontological implications of the doctrine. Wyclif, like Scotus, claims that the notion of being is the most general one, a notion entailed by all others, but he also states that an extra-mental reality corresponds to the concept of being-in-general (*ens in communi*). This extra-mental reality is predicated of everything (God and creatures, substances and accidents, universal and individual essences) according to different degrees, since God *is* in the proper sense of the term and any other entity is (something real) only insofar as it shares the being of God (*De ente in communi*, chap. 1, pp. 1-2; chap. 2, p. 29; *De ente praedicamentali*, chap. 1, p. 13; chap. 4, p. 30; *Tractatus de universalibus*, chap. 4, p. 89; chap. 7, p. 130; chap. 12, p. 279; *De materia et forma*, chap. 6, p. 213).

If being is a reality, it is then clear that it is impossible to affirm its univocity. The *Doctor Subtilis* thought of being as simply a concept, and therefore could describe it as univocal in a broad sense (one name -- one concept -- many natures). Wyclif, on the contrary, is convinced that the being-in-general is an extra-mental reality, so he works out his theory at a different level than does Scotus: no more at the intensional level (the meaning connected with the univocal sign, or *univocum univocans*), but at the extensional one (the thing signified by the mental sign, considered as shared by different entities

according to different degrees). For that reason, he cannot use Aristotelian univocation, which hides these differences in sharing. Thus he denies the univocity of being and prefers to use one of the traditional notions of analogy (*De ente praedicamentali*, chap. 3, pp. 25, 27), since the being of God is the measure of the being of other things, which are drawn up on a scale with the separated spiritual substances at the top and prime matter at the bottom. Therefore he qualifies being as an ambiguous genus (*ibidem*, p. 29), borrowing an expression already used by Grosseteste in his commentary on Aristotle's *Posterior Analytics*. The analogy of being does not entail a multiplicity of correlated meanings, however, as in Thomas Aquinas. Since Wyclif hypostatizes the notion of being and considers equivocity, analogy, and univocity as real relations between things, not as semantic relations between terms and things, his analogy is partially equivalent to the standard Aristotelian univocity, since what differentiates analogy from univocity is the way a certain nature (or property) is shared by a set of things: analogous things (*analoga*) share it according to different degrees (*secundum magis et minus*, or *secundum prius et posterius*), while univocal things (*univoca*) share it all in the same manner and at the same degree. This is the true sense of his distinction between ambiguous genera, like being and accident (*accidens*), and logical genera, like substance (*De ente praedicamentali*, chap. 4, pp. 30, 32). Hence, according to this account, being in general is the basic component of the metaphysical structure of each reality, which posses it in accordance with its own nature, value, and position in the hierarchy of created beings.

Unfortunately, this theory is weak in an important point, since Wyclif does not clarify the relation between being-in-general and God. On the one hand, being is a creature, the first of all the creatures; on the other hand, God should share it, as being-in-general is the most common reality, predicated of all, and according to him to-be-predicated-of something means to-be-shared-by it. As a consequence, a creature would be in some respect superordinated to God -- a theological puzzle that Wyclif failed to acknowledge.

3.2 Being and truth

According to Wyclif, the constitutive property of each kind of being is the capacity to be the object of a complex act of signifying (*De ente in communi*, chap. 3, p. 36; *De ente primo in communi*, chap. 1, p. 70). This choice implies a revolution in the standard medieval theory of transcendentals, since Wyclif actually replaces being (*ens*) with true (*verum*). According to the common belief, among the transcendentals (being, thing, one, something, true, good) being was the primitive notion, from which all the others stemmed by adding a specific connotation in relation to something else, or by adding some new determination. So true (*verum*) was nothing but being (*ens*) itself considered in relation to an intellect, no matter whether divine or human. In Wyclif's view, on the contrary, being is no longer the main transcendental and its notion is not the first and simplest; rather there is something more basic to which being can be reduced: truth (*veritas* or *verum*). According to the English philosopher, only what can be signified by a complex expression is a being, and whatever is the proper object of an act of signifying is a truth. Truth is therefore the true name of being itself (*Tractatus de universalibus*, chap. 7, p. 139). Thus everything that is is a truth, and every truth is something not simple but complex. Absolute simplicity is unknown within Wyclif's metaphysical world. From the semantic point of view, this means the collapsing of the fundamental distinction in the common Aristotelian theory of meaning, the one between simple signs (like nouns) and compound signs (like propositions). From the ontological point of

view, this entails the uniqueness in type of what is signified by every class of categorematic expressions (*Logica*, chap. 5, p. 14). Within Wyclif's world, it is the same (kind of) object that both concrete terms and propositions refer to, as individual substances have to be regarded as (atomic) states of affairs. According to him, from the metaphysical point of view a singular man is nothing but a real proposition (*propositio realis*), where actual existence in time as an individual plays the role of the subject, the common nature (i.e., human nature) plays the role of the predicate, and the singular essence (i.e., that by means of which this individual is a man) plays the role of the copula (*ibid.*, pp. 14-15).

Despite appearances, Wyclif's opinion on this subject is not just a new formulation of the theory of the *complexe significabile*. According to the supporters of the *complexe significabile* theory, the same things that are signified by simple concrete terms are signified by complex expressions (or propositions). In Wyclif's thought, on the contrary, there are no simple things in the world that correspond to simple concrete terms; rather, simple concrete terms designate real propositions, that is, (atomic) states of affairs. Wyclif's real proposition is everything that is, as everything save God is composed at least of potency and act (*De ente praedicamentali*, chap. 5, pp. 38-39), and therefore can be conceived of and signified both in a complex (*complexe*) and in a non-complex manner (*incomplexe*) (*Tractatus de universalibus*, chap. 2, pp. 55-56; chap. 3, pp. 70, 74, and 84; chap. 6, pp. 118-19). When we conceive of a thing in a complex manner, we think of that thing considered according to its metaphysical structure, and so according to its many levels of being and kinds of essence. As a consequence, Wyclif's metaphysical world, like his physical world, consists of atomic objects, that is, single essences belonging to the ten different types or categories. But these metaphysical atoms are not simple but rather composite, because they are reducible to something else, belonging to a different rank of reality and unable to exist by itself: being and essence, potency and act, matter and form, abstract genera, species and differences. For that reason, everything one can speak about or think of is both a thing and an atomic state of affairs, while every true sentence expresses a molecular state of affairs, that is, the union (if the sentence is affirmative) or the separation (if the sentence is negative) of two (or more) atomic objects.

3.3 Being and essence

Among the many kinds of beings Wyclif lists, the most important set is that consisting of categorial beings. They are characterized by the double fact of having a nature and of being the constitutive elements of finite corporeal beings or atomic states of affairs. These categorial items, conceived of as instances of a certain kind of being, are called by Wyclif ‘essences’ (‘*essentiae*’). An essence therefore is a being that has a well defined nature, even if the name ’essence’ does not make this nature known (*De ente primo in communi*, chap. 3, pp. 88-89; *De ente praedicamentali*, chap. 5, p. 43; *Tractatus de universalibus*, chap. 7, pp. 128-29; *De materia et forma*, chap. 4, pp. 185-86). So the term ‘essence’ (‘*essentia*’) is less general than ‘being’ (‘*ens*’), but more general than ‘quiddity’ (‘*quidditas*’), since (i) every essence is a being, and not every being is an essence, and (ii) every quiddity is an essence, and not every essence is a quiddity, as individual things are essences but are not quiddities (see Kenny 1985, pp. 21 ff.; and Conti 1993, pp. 171-81).

According to Wyclif, being is the stuff that the ten categories modulate according to their own nature, so

that everything is immediately something that is (*De ente praedicamentali*, chap. 4, p. 30; *Tractatus de universalibus*, chap. 7, p. 130); therefore, he maintains no real distinction between essence and being. The essences of creatures do not precede their beings, not even causally, since every thing is (identical with) its essence. The being of a thing is brought into existence by God at the same instant as its essence, since essence without being and being without essence would be two self-contradictory states of affairs. In fact, essence without being would imply that an individual could be something of a given type without being real in any way, and being without essence would imply that there could be the existence of a thing without the thing itself (*Tractatus de universalibus*, chap. 6, pp. 122-23). As a consequence, the *pars destruens* of his theory of being and essence is a strong refutation of the twin opinions of St. Thomas and Giles of Rome. Although Wyclif does not name either the Dominican master or the Augustinian one, it is nevertheless clear from the context that their conceptions are the object of his criticisms (*ibid.*, pp. 120-22).

On the other hand, it is evident that while from the extensional point of view the being and essence of creatures are equipollent, since every being is an essence and *vice versa*, from the intensional point of view there is a difference, because the being of a thing *logically* presupposes its essence and not *vice versa* (*De materia et forma*, chap. 4, pp. 184-85). Moreover, in Wyclif's opinion, every creature has two different kinds of essence and four levels of being. Indeed, he clearly distinguishes between singular essence and universal essence (*essentia quidditativa speciei vel generis*) -- that is, the traditional *forma partis* and *forma totius*. The singular essence is the form that in union with the matter brings about the substantial composite. The universal essence is the type that the former instantiates; it is present in the singular substance as a constitutive part of its nature, and it discloses the inner metaphysical structure of the substantial composite (*Tractatus de universalibus*, chap. 6, pp. 116-18). Furthermore, he speaks of four-fold level of reality (*esse*):

1. First, the eternal mental being (*esse ideale*) that every creature has in God, as an object of His mind.
2. Second, the potential being everything has in its causes, both universal (genus, species) and particular. This is closely connected with the nature of the individual substance on which the finite corporeal being is founded, and is independent of its actual existence. It is called ‘*esse essentiae*’ or ‘*esse in genere*’.
3. Third, the actual existence in time as an earthly object.
4. Fourth, the accidental being (*modus essendi accidentalis substantiae*) caused in a substance by the inhering in it of its appropriate accidental forms (*Tractatus de universalibus*, chap. 7, pp. 126-28).

Thus the identity between essence and being cannot be complete. Consequently Wyclif speaks of a formal difference (*distinctio* or *differentia formalis*) -- which he also calls a ‘difference of reason’ (*distinctio rationis*) -- between essence and being. More precisely, he holds that:

1. The *esse ideale* is formally distinct from the singular essence;
2. The actual existence is formally distinct from the universal essence; and
3. The singular essence is formally distinct from the actual existence.

In this way, Wyclif establishes a close connection between singular essence and essential being, on the one hand, and a real identity between universal and individual (that is, between universal essence and singular essence), on the other hand. Essential being is the level of being that matches singular essence, while actual existence is in a certain way accidental to the singular essence, as the latter is nothing else but the universal essence considered as informing matter.

4. Theology

4.1 Divine ideas

According to St. Thomas (see *In I Sent*., d. 19, q. 5; d. 36, qq. 1-2; and *STh*. I, qq. 14-15) -- whose doctrine of divine ideas can be considered a perfect background for a better understanding of Wyclif's theory -- divine ideas are really the same as the divine essence, but distinct in reason from it. Everything produced by God has a certain similarity with the divine essence, since divine ideas are the ways in which God views His essence as capable of being imitated by a possible creature. When a given possible creature is brought into existence by the divine volition, the divine idea that is its corresponding paradigm also serves as a principle of divine creation and becomes therefore an *exemplar* in the strict sense of the term. As a consequence, according to Aquinas, there is a difference between a divine idea as a mere principle of knowledge (*ratio*) by means of which God thinks of a given possible and a divine idea as an exemplar by means of which God produces a certain set of individuals. This difference prevents Aquinas' system from being a form of necessitarism, as the two spheres of existent and possible do not coincide, since the existent is a sub-set of the possible.

Wyclif defines ideas as the divine nature in action, since they are the means by which God creates all that is outside Himself. In this way, any distinction between the ideas as *rationes* and the ideas as *exemplaria* is abolished. Furthermore, ideas are the constitutive principles of the divine nature, essentially identical with it. Thus divine ideas become as necessary as the divine nature itself (*Tractatus de universalibus*, chap. 15, pp. 371-74). On the other side, ideas are the first level of being proper to creatures (see above Section 3.3). As a consequence, everything that is is necessary and a necessary object of God's volition; the three spheres of possible, existent, and necessary totally coincide.

4.2 Divine omnipotence

This doctrine of divine ideas and the connected theory of being had a significant result also for the notion of divine omnipotence. In the Middle Ages, one of the most important features of divine omnipotence was the capacity of annihilating, which was viewed as the necessary counterpart of the divine capacity of creating. Wyclif denies the thesis of an opposition between creation and annihilation, and openly denies that God can annihilate creatures. He argues that nothing is contrary to creation, since the act of creating is peculiar to God, and nothing is opposite or contrary to God. In fact, *absolute* non-being (the only "thing" that could be considered opposite to God) is something self-contradictory, and therefore logically impossible. Accordingly, there cannot be any action opposite to creation. The only possible kind of non-

being admitted by Wyclif is corruption (*corruptio*), that is, the natural destruction of the actual existence in time of an object in the world (*Tractatus de universalibus*, chap. 13, pp. 302-3).

On the other hand, according to Wyclif, annihilation, if possible, would be equivalent to the total destruction of all of a creature's levels of being (*ibid.*, p. 307), and thus would imply the following absurdities:

1. God could not annihilate any creature without destroying the whole world at once, since universal-being is the basic constitutive element of the second level of being (the *esse essentiae* or *esse in genere*) of each creature (*ibid.*, pp. 307-8).
2. Since annihilation would be nothing but an accident, and more precisely an action, it would be really different from both the acting subject (i.e. God) and the object of the action (i.e., the thing that would be annihilated). But any accident requires a substrate of inherence. In this case, it cannot be God. Thus, it must be the object of annihilation. Yet, because of its particular nature, if there is annihilation, its substrate of inherence cannot be, and therefore the annihilation itself cannot be, since no accident can exist without any substrate of inherence -- an apparently self-contradictory state of affairs (*ibid.*, pp. 310-11).
3. God could not annihilate any creature without annihilating Himself at the same time, because the first and most basic level of being of every creature is rooted in the divine essence itself (*ibid.*, pp. 313-14).

The image of God Wyclif draws here is not the Christian image of the Lord of the universe, who freely creates by an act of His will and has absolute power and control over everything, but a variation of the Neoplatonic notion of the One. Wyclif's God is simply the supreme principle of the universe from which everything necessarily flows. Within Wyclif's system, creation is a form of emanation, as each creature is necessarily connected with the divine essence itself by means of its *esse ideale*. God has been deprived of the power of revocation (*ibid.*, pp. 304-5), and the only action He can, or rather has to, perform is creation. Because of the necessary links between (i) the divine essence and the eternal mental being that every creature has in God and (ii) this first level of being of creatures and the remaining three, in God to think of creatures is already to create them. But God cannot help thinking of creatures, since to think of Himself is to think of His constitutive principles, that is, of the ideas of creatures. Therefore, God cannot help creating. Indeed, He could not help creating just this universe.

Wyclif's rejection of the possibility of annihilation and the subsequent new notion of divine onnipotence shed light on his theory of universals, as they help us to appreciate the difference between his thesis of the identity between universals and individuals and the analogous thesis of moderate Realists. For these latter, this identiy meant that *the* individuals are *in potentia* universal; for Wyclif it means that *the* individuals are *the* universals *qua* existing *in actu* -- that is, the individuals are the outcome of a process of production that is inscribed into the nature of general essences themselves, and through which general essences change from an incomplete type of subsistence as forms to a full existence as individuals. This position is consistent with (i) his theory of substance, where the main and basic composition of every substance, both individual and universal, is not the hylemorphic one, but the composition of potency and act (*De ente praedicamentali*, chap. 5, pp. 38-39), and (ii) a Neoplatonic reading of Aristotelian

metaphysics, where universal substances, and not individual ones as the Stagirite had taught, are the main and fundamental kind of being.

4.3 The Eucharist

Wyclif's heretical theses concerning the Eucharist are the logical consequence of the application of this philosophical apparatus to the problem of the real presence of the body of Christ in the consecrated host. According to Catholic doctrine, after consecration the body of Christ is really present in the host instead of the substance of the host itself, while the accidents of the host are the same as before. St. Thomas's explanation of this process, called ‘transubstantiation’, was that the substance of the bread (and wine) was changed into the body (and blood) of Christ, whereas its quantity, through which the substance of the bread received physical extension and the other accidental forms, was now the entity that kept the other accidental forms physically in being. Duns Scotus and Ockham, on the contrary, had claimed that after consecration the substance of the bread (and wine) was annihilated by God, while the accidents of the bread (and wine) remained the same as before because of an intervention of divine omnipotence.

Wyclif rejects both solutions as well as the Catholic formulation of the dogma, since he could not accept the ideas of the destruction of a substance by God and of the existence of the accidents of a given singular substance without and apart from that singular substance itself -- two evident absurdities within the metaphyisical framework of his system of thought. As a consequence, Wyclif affirms the simultaneous presence in the Eucharist of the body of Crhist and of the substance of the bread (and wine), which continues to exist even after the consecration. According to him, transubstantiation is therefore a twofold process, natural and supernatural. There is natural transubstantiation when a substitution of one substantial form for another takes place, but the subject-matter remains the same. This is the case with water that becomes wine. There is supernatural transubstantiation when a miraculous transformation of the substantial entity at issue takes place. This was the case, for instance, with the incarnation of the second person of the Trinity, who is God and became man (*De apostasia*, p. 170). The Eucharist implies this second kind of transubstantiation, since the Eucharist, like Christ, has a dual nature: earthly and divine. According to its earthly nature the Eucharist is bread (and wine), but according to its divine nature it is the body of Christ, which is present in the host spiritually or habitudinnaly, since it is in virtue and by means of faith only that it could be received (*De apostasia,* pp. 180 and 210; *De eucharistia,* pp. 17, 19, 51-52, and 230; for a description of the habitudinal presence, see the definition of the habitudinal predication above, Section 2.3).

5. Religious and Political Thought

5.1 The Bible and the Church

Wyclif conceives Sacred Scripture as a direct emanation from God himself, and therefore as a timeless, unchanging, and archetypal truth independent of the present world and of the concrete material text by means of which it is manifested. As a consequence, in his *De veritate Sacrae Scripturae* (*On the Truth of*

Sacred Scripture -- between late 1377 and the end of 1378) he tries to show that, despite appearences, the Bible is free from error and contradictions. The exegetic principle he adopts is the following: since the authority of Scripture is greater than our capacity of understanding, therefore if some error and/or inconsistencies are found in the Bible, there is something wrong with our interpretation. The Bible contains the whole truth and nothing but the truth, so that nothing can be added to it or subtracted from it. Every part of it has to be taken absolutely and without qualification (*De veritate Sacrae Scripturae,* vol. 1, pp. 1-2, 395, 399; vol. 2, pp. 99, 181-84).

In attributing inerrancy to the Bible, Wyclif was following the traditional attitude towards it, but the way he viewed the book detached him from Catholic tradition, as he thought that his own metaphysical system was the necessary interpretative key for the correct understanding of Biblical truth. In fact, in the *Trialogus* (*Trialogue* -- between late 1382 and early 1383), where Wyclif gives us the conditions for achieving the true meaning of the Bible, they are the following:

1. knowledge of the nature and ontological status of universals;
2. knowledge of the peculiar nature of accidents as dependent in existence on their substantial substrates;
3. knowledge of past and future states of affairs (*praeteritiones* and *futuritiones*) as real in the present as past and future truths, not as things (*res*) that have been real in the past and will be real in the future (a thesis of his already claimed in the *De ente praedicamentali,* chap. 1, pp. 2 and 5; *Purgans errores circa veritates in communi,* chap. 1, pp. 1-2; chap. 3, pp. 10-11);
4. knowledge of the eternal existence of creatures in God at the level of intelligible being really identical with the divine essence itself;
5. knowledge of the perpetual existence of material essences (*Trialogus,* book 3, chap. 31, pp. 242-43).

Only on the basis of this logical and metaphyisical machinery is it possible to grasp the five different levels of reality of the Bible, which is at the same time:

1. the book of life mentioned in the *Apocalypse*;
2. the ideal being proper to the truths written in the book of life;
3. the truths that are to be believed as they are written in the book of life;
4. the truths that are to believed as they are written in the natural books that are men's souls;
5. all the artificial signs of the truth (*De veritate Sacrae Scripturae,* vol. 1, p. 109).

This same approach, when applied to the Church, led Wyclif to fight against it in its contemporary state. (On Wyclif's ecclesiology see Leff 1967, pp. 516-46.) The starting point of Wyclif's reflection on the Church is the distinction between the heavenly and the earthly cities that St. Augustine draws in his *De civitate Dei.* In St. Augustine such a division is metaphorical, but Wyclif made it literal. So he claims that the Holy Catholic Church is the mystical and indivisible community of the saved, eternally bound together by the grace of predestination, while the foreknown, i.e. the damned, are eternally excluded from it (*De civili dominio,* vol. 1, p. 11). This community of the elect is really distinct from the various particular earthly churches (*ibid.*, p. 381). It is timeless and outside space, and therefore is not a physical

entity; its being, like the actual being of any other universal, is wherever any of its members is (*De ecclesia*, p. 99). All its members always remain in grace, even if temporally in mortal sin (*ibid.*, p. 409), as conversely the damned remain in mortal sin, even if temporally in grace (*ibid.*, p. 139). The true Church is presently divided into three parts: the triumphant Church in heaven; the sleeping Church in purgatory; and the militant Church on earth (*ibid.*, p. 8). But the militant Church on earth cannot be identified with the visible church and its hierarchy. Even more, since we cannot know who are the elect, there is no reason for consenting to recognize and obey the authority of the visible church (see *De civili dominio*, vol. 1, p. 409; *De ecclesia*, pp. 71-2). Authority and dominion rely on God's law manifested by Sacred Scripture. As a consequence, obedience to any member of the hierarchy is to be subordinated to his fidelity to the precepts of the Bible (*De civili dominio*, vol. 2, p. 243; *De potestate papae* [*On the Power of the Pope* -- ca. 1379], p. 149; De *ecclesia*, p. 465). Faithfulness to the true Church can entail the necessity of rebelling against the visible church and its members, when their requests are in conflict with the teaching of Christ (*De civili dominio*, vol. 1, pp. 384, 392).

In conclusion, since the visible church cannot help the believers gain salvation, which is fixed from eternity, and its authority depends on its fidelity to divine revelation, it cannot perform any of the functions traditionally attributed to it, and it therefore has no reason for its own existence. To be ordained a priest offers no certainty of divine approval and authority (*De ecclesia*, p. 577). Orthodoxy can only result from the application of right reason to the faith of the Bible (*De veritate Sacrae Scripturae*, vol. 1, p. 249). The Pope, bishops, abbots, and priests are expected to prove their really belonging to the Holy Catholic Church through their exemplary behavior; they should be poor and free from worldly concerns, and they should spend their time preaching and praying (*De ecclesia*, pp. 41, 89, 129). In particular, the Pope should not interfere in worldly matters, but should be an example of holiness. Believers are always allowed to doubt the clergy's legitimacy, which can be evaluated only on the basis of its consistency with the Evangelic rules (*ibid.*, pp. 43, 456). Unworthy priests forfeit their right to exercise authority and to hold property, and lay lords might deprive them of their benefices (*De civili dominio*, vol. 1, p. 353; vol. 3, pp. 326, 413; *De ecclesia*, p. 257).

5.2 Dominion

As Leff remarked (Leff 1967, p. 546), the importance of Wyclif's teaching on dominion and grace has been exaggerated. His doctrine depends on Richard Fitzralph's theory, according to which the original lordship is independent of natural and civil circumstances (on Fitzralph's conception see Robson 1961, pp. 70-96), and is only a particular application of Wyclif's general view on election and damnation. In fact, the three main theses of the first book of his *De civili dominio* are the following:

1. a man in sin has no right to dominion;
2. a man who is in a state of grace possesses all the goods of the world;
3. as a consequence, there can be no dominion without grace as its formal cause (*De civili dominio*, vol. 1, p 1).

Wyclif defines dominion as the right to exercise authority and, indirectly, to hold property. According to

him, there are three kinds of possession: natural, civil, and evangelical. Natural possession is the simple possession of goods without any legal title. Civil possession is the possession of goods on the basis of some civil law. Evangelical possession requires, beyond civil possession, a state of grace in the legal owner. Thus God alone can confer evangelical possession (*ibid.,* p. 45). On the other hand, a man in a state of grace is lord of the visible universe, but on the condition that he shares his lordship with all the other men who are in a state of grace, as all men in a state of grace have the same rights. This ultimately means that all the goods of God should be in common, just as they were before the Fall. Private property was introduced as a result of sin. From this point of view it is also evident that Aristotle's criticisms against Plato are unsound, since Platonic communism is correct in essence (*ibid.,* pp. 96 ff.). The purpose of civil law is to preserve the necessities of life (*ibid.,* pp. 128-29). The best form of government is monarchy. Kings must be obeyed and have taxes paid to them, even if they become tyrants, since they are God's vicars that He alone can depose -- so that only secular lordship is justified in the world (*ibid.,* p. 201).

Bibliography

Primary Literature

- *De civili dominio,* R. L. Poole, J. Loserth & F. D. Matthew, ed., 4 vols., London: Trübner for the Wyclif Society, 1895-1904.

Medieval Theories of Analogy

Medieval theories of analogy were a response to problems in three areas: logic, theology, and metaphysics. Logicians were concerned with the use of words having more than one sense, whether completely different, or related in some way. Theologians were concerned with language about God. How can we speak about a transcendent, totally simple spiritual being without altering the sense of the words we use? Metaphysicians were concerned with talk about reality. How can we say that both substances (e.g., Socrates) and accidents (e.g., the beardedness of Socrates) exist when one is dependent on the other; how can we say that both God and creatures exist, when one is created by the other? Medieval thinkers reacted to these three problems by developing a theory which divided words into three sorts, independently of context. Some were univocal (always used with the same sense), some were purely equivocal (used with quite different senses), and some were analogical (used with related senses). Analogical terms were thought to be particularly useful in metaphysics and theology, but they were routinely discussed in commentaries on Aristotle's logic and in logic textbooks. The background to the discussion was given by what is often called the analogy of being, the doctrine that reality is divided horizontally into the very different realities of substances and accidents, and vertically into the very different realities of God and creatures. Nonetheless, the phrase "medieval theories of analogy" refers not to ontology but to a set of linguistic and logical doctrines supplemented, at least from the fourteenth century on, by doctrines about the nature of human concepts.

There were three main types of analogy. In the original Greek sense, analogy involved a comparison of two proportions or relations. Thus ‘principle’ was said to be an analogical term when said of a point and a spring of water because a point is related to a line as a spring is related to a river. This type of analogy came to be called the analogy of proportionality. In the second sense, analogy involved a relation between two things, of which one is primary and the other secondary. Thus ‘healthy’ was said to be an analogical term when said of a dog and its food because while the dog has health in the primary sense, its food is healthy only secondarily as contributing to or causing the health of the dog. This second type of analogy became known as the analogy of attribution, and its special mark was being said in a prior and a posterior sense (*per prius et posterius*). A third type of analogy, sometimes appealed to by theologians, appealed to a relation of likeness between God and creatures. Creatures are called good or just because their goodness or justice imitates or reflects the goodness or justice of God. This type of analogy was called the analogy of imitation or participation. Of the three types, it is the analogy of attribution that is central to medieval discussions.

From the fourteenth century on discussions of analogy focused not so much on linguistic usages as on the nature of the concepts that corresponded to the words used. Is there just one concept that corresponds to

an analogical term, or is there a sequence of concepts? If the latter, how are the members of the sequence ordered and related to each other? Moreover, how far should we distinguish between so-called formal concepts (or acts of mind) and objective concepts (whatever it is that is the object of the act of understanding)? These discussions were still influential at the time of Descartes.

1. Medieval Theories of Language

Medieval logicians and philosophers of language were principally concerned with the relationship between utterances, concepts, and things. Written language was only of secondary importance. They agreed that spoken language was conventional, having its origin in imposition, or the decision to correlate certain sounds with certain objects. Concepts, however, were natural, in the sense that all human beings with similar experiences had the same concepts, without any decision being involved. The key semantic notion was signification, rather than meaning, though translated sources tend to obscure this by translating ‘significatio’ as ‘meaning’. For a term to signify is for it to function as a sign, to represent or make known something beyond itself. A typical spoken term, such as ‘horse’ or ‘dog’, signifies in two ways. It signifies or makes known the concept with which it has to be correlated in order to function significatively at all, and it also signifies or makes known something external to and independent of the mind. Modifications were made to this simple scheme to cover the cases of special terms, including syncategorematic terms, such as ‘every’ and ‘not’, fictional terms such as ‘chimera’, and privative terms such as ‘blindness’; and modifications were also made to cover the case of special predicates, such as "is a genus", or "is thought about", but we need not concern ourselves with these modifications here.

Theories of signification were complicated by the metaphysical problem of common natures. If we say that words signify things external to and independent of the mind do we mean that ‘a human being’ and ‘beard’ signify special common objects such as humanity or beardedness, or do we mean that they

signify Socrates and his beard? For some thinkers, the primary significate of a common noun was the common nature, and the secondary significate was the thing having that nature. For Aquinas, who did not want to give common natures any kind of intermediary existence independent of both concepts and actual things, the significate (*significatum*) of a term was the intellect's conception (whether simple or definitional) of the thing signified; the thing signified (*res significata*) was the property or the nature characterizing individual external objects; and the referent (*suppositum*) was the individual external object itself. In the fourteenth century, further developments took place. On the one hand, there was a new focus on the notion of a mental language superior to spoken language, and concepts, as parts of this mental language, were themselves regarded as having signification. On the other hand, William Ockham and his followers not only denied the existence of common natures but insisted that spoken words did not signify concepts. As a result, both spoken words and the concepts to which spoken words are subordinated have the same significates, namely individual things and their individual properties (e.g., the beardedness of Socrates).

In addition to having signification, terms were also said to have modes of signifying (*modi significandi*). These modes of signifying were related to the term's logical and grammatical functions, and include such essential features as being a noun, verb, or adjective, and such accidental features as time (which includes tense without being limited to it), gender, and case. More generally, they included being abstract (e.g., justice) and concrete (e.g. just). They also include modes of predication, related to Aristotle's ten categories, such as substantial (e.g. horse), qualitative (e.g., brown), quantitative (e.g. square), relative and so on. The notion of modes of signifying was developed from the early twelfth century on, though it was specially emphasized by the speculative grammarians of the late thirteenth century.

It is important to recognize that words were thought to be endowed as units both with their signification and with nearly all their modes of signifying in advance of the role they would subsequently play in propositions. Moreover, the doctrine of common natures suggested that terms, at least those terms which seem to fall within Aristotle's ten categories (substance, quality, quantity and so on), each correspond to a common nature and so have a signification which is fixed and precise. This meant that questions of use and context, though explored by medieval logicians, for instance through supposition theory, were not thought to be crucial to the determination of a term as equivocal, analogical or univocal. It also meant that terms which did not fit into Aristotle's categorial framework needed a special account. This problem relates especially to theology, because God was thought to transcend the categories in the sense that none of them apply to him, and also to metaphysics, because of the so-called transcendental terms, ‘being’, ‘one’, ‘good’. These transcend the categories in the sense that they belong no more to one category than to another, and they do not correspond to common natures.

2. Problems in Logic, Theology, and Metaphysics

In order to understand how the theory of analogy arose we have to bear in mind the history of education in the Latin-speaking western part of Europe. During the so-called dark ages, learning was largely confined to monasteries, and people had access to very few texts from the ancient world. This situation had changed dramatically by the beginning of the thirteenth century. The first universities (Bologna,

Paris, Oxford) had been established, and the recovery of the writings of Aristotle supplemented by the works of Islamic philosophers was well under way.

One source for the theory of analogy is the doctrine of equivocal terms found in logic texts. Until the early twelfth century, the only parts of Aristotle's logic to be available in Latin were the *Categories* and *On Interpretation*, supplemented by a few other works including the monographs and commentaries of Boethius. The *Categories* opens with a brief characterization of terms used equivocally, such as ‘animal’ used of real human beings and pictured human beings, and terms used univocally, such as ‘animal’ used of human beings and oxen. In the first case, the spoken term is the same but there are two distinct significates or intellectual conceptions; in the second case, both the spoken term and the significate are the same. We should note that equivocal terms include homonyms (two words with the same form but different senses, e.g., ‘pen’), polysemous words (one word with two or more senses), and, for medieval thinkers, proper names shared by different people. By the mid-twelfth century the rest of Aristotle's logic had been recovered, including the *Sophistical Refutations* in which Aristotle discusses three types of equivocation and how these contribute to fallacies in logic. For writers throughout the later middle ages, the discussion of analogical terms was fitted into the framework of univocal and equivocal terms provided by Aristotle and his commentators. We will return to this below.

Twelfth-century theology is another important source for the doctrine of analogy, for twelfth-century theologians such as Gilbert of Poitiers and Alan of Lille explored the problem of divine language in depth. Their work initially sprang from works on the Trinity by Augustine and Boethius. These authors insisted that God is absolutely simple, so that no distinctions can be made between God's essence and his existence, or between one perfection, such as goodness, and another, such as wisdom, or, more generally, between God and his properties. New attention was also paid to Greek theologians, especially Pseudo-Dionysius. These theologians insisted on God's absolute transcendence, and on what came to be called negative theology. We cannot affirm anything positive about God, because no affirmation can be appropriate to a transcendent being. It is better to deny properties of God, saying for instance that he is not good (i.e., in the human sense), and still better to say that God is not existent but super-existent, not substance but super-substantial, not good but super-good. These theological doctrines raised the general problem of how we can speak meaningfully of God at all, but they also raised a number of particular problems. Must we say that "God is justice" means the same as "God is just"? Must we say that "God is just" means the same as "God is good"? Can we say that God is just and that Peter is just as well? For our purposes, this last question is the most important, for it raises the question of one word used of two different realities.

The third source for doctrines of analogy is metaphysics. The first part of Aristotle's *Metaphysics* had been translated by the mid-twelfth century, though the full text was recovered only gradually. One crucial text is found in *Metaphysics* 4.2 (1003a33-35): "There are many senses (*multis modis*) in which being (*ens*) can be said, but they are related to one central point (*ad unum*), one definite kind of thing, and are not equivocal. Everything which is healthy is related to health.... and everything which is medical to medicine...." In this text, Aristotle raises the general problem of the word ‘being’ and its different senses, and he also introduces what is known as *pros hen* equivocation or focal meaning, the idea that different senses may be unified through a relationship to one central sense. Another foundational text is

from Avicenna's *Metaphysics*, also translated into Latin during the twelfth century, where he writes that being (*ens*) is neither a genus nor a predicate predicated equally of all its subordinates, but rather a notion (*intentio*) in which they agree according to the prior and the posterior. As we shall see below, this reference to the prior and the posterior is particularly important.

3. History of the Word ‘Analogy’

The Latin term ‘*analogia*’ had various senses. In scriptural exegesis, according to Aquinas, analogy was the method of showing that one part of scripture did not conflict with another. In rhetoric and grammar, analogy was the method of settling a doubt about a word's form by appeal to a similar and more certain case. Several twelfth-century theologians use the word in this sense. In translations of Pseudo-Dionysius, analogy refers to an angel's cognitive capacity in relation to lower or higher beings. In logic, authors were aware that the Greek word ‘*analogia*’, sometimes called ‘*analogia*’ in Latin, but often translated as ‘*proportio*’ or ‘*proportionalitas*’, referred to the comparison between two proportions. However, by the 1220s theologians had begun to use ‘analogy’ in the new sense of a word said in a prior and a posterior sense, and by the 1250s this new use was embedded in the logical texts. The phrase "in a prior and a posterior sense" came into use before the word ‘analogy’ was employed, and seems to have been derived from Arabic philosophy. H. A. Wolfson has presented evidence for Aristotle's recognition of a type of term intermediate between equivocal and univocal terms, some instances of which were characterized by their use according to priority and posteriority. He showed that Alexander of Aphrodisias called this type of term ‘ambiguous’ and that the Arabic philosophers, starting with Alfarabi, made being said in a prior and a posterior sense the main characteristic of all ambiguous terms.

So far as the medieval Latin west is concerned, the main sources for the notion of an ambiguous term said in a prior and a posterior sense are Algazel and Avicenna, both of whom became known in the second half of the twelfth century, and both of whom used the notion to explain uses of the word ‘being’. The word ‘analogical’ soon replaced the word ‘ambiguous’ in Latin authors. Alexander of Hales in his *Glossa* which dates from the 1220s links being said in a prior and a posterior sense with ambiguity and (in one manuscript) with analogy. In the writings of Philip the Chancellor from the same decade, being said in a prior and a posterior sense is called ‘analogy’. In logic, the word ‘analogy’ in the new sense appears in the *Summe metenses*, once dated around 1220, but now thought to be by Nicholas of Paris, writing between 1240 and 1260. The new use of ‘analogy’ rapidly became standard in both logicians and theologians.

4. Divisions of Equivocation

In order to understand the way in which theories of analogy developed, we need to consider the divisions of equivocation found in medieval authors. In his commentary on the *Categories*, Boethius presented a series of divisions which he took from Greek authors. The first division was into chance equivocals and deliberate equivocals. In the first case, the occurrences of the equivocal term were totally unconnected, as when a barking animal, a marine animal, and a constellation were all called ‘*canis*’ (dog). Chance

equivocation was also called pure equivocation, and it was carefully distinguished from analogy by later writers. In the second case, that of deliberate equivocation, some intention on the part of the speakers was involved, and the occurrences of the equivocal term could be related in various ways. Boethius himself gave four subdivisions. These are found in various later sources, including Ockham's commentary on the *Categories*, but as we shall see, other subdivisions became more popular.

The first of Boethius's four subdivisions was similitude, used of the case of the noun ‘animal’ said of both real human beings and pictured human beings. Medieval logicians seem to have been totally unaware of the fact that the Greek word used by Aristotle was genuinely polysemous, meaning both animal and image, and they explained the extended use of ‘animal’ in terms of a likeness between the two referents -- a likeness which had nothing to do with the significate of the term ‘animal’, which picks out a certain kind of nature, but which was nonetheless more than metaphorical in that the external shape of the pictured object does correspond to that of the living object. Those medieval authors whose discussion of equivocation was very brief tended to use this example, and they often claimed that Aristotle introduced it in order to accommodate analogy as a kind of equivocation. On the other hand, authors whose discussion was more extensive tended to drop both the example and the subdivision of similitude.

Boethius's second type of equivocation is ‘*analogia*’ in the Greek sense, and the standard example was the word ‘*principium*’ (principle or origin), which was said to apply to unity with respect to number and to point with respect to a line, or to both the source of a river and the heart of an animal. ‘*Principium*’ is a noun and, as such, might be expected to pick out a common nature, but although a unity, a point, a source and a heart can all be called ‘*principium*’ with equal propriety, there is no common nature involved. Mathematical objects, rivers, and hearts, represent not merely different natural kinds, but different categories, in that mathematical objects fall under the category of quantity, and hearts at least under the category of substance. What allows these disparate things to be grouped together is a similarity of relations: a source is to a river as a heart is to an animal -- or so it was claimed. While theologians, including Aquinas himself in De veritate, and the fourteenth-century Dominican Thomas Sutton, occasionally make use of this type of analogy, most logicians do not even mention it.

The last two subdivisions found in Boethius are ‘of one origin’ (*ab uno*), with the example of the word ‘medical’, and ‘in relation to one’ (*ad unum*), with the example of the word ‘healthy’. These subdivisions correspond to Aristotle's *pros hen* equivocation. The example ‘healthy’ (*sanum*) as said of animals, their diet, and their urine is particularly important here. ‘Sanum’, like other adjectives, was classified as a concrete accidental term. As such, it did not fall within an Aristotelian category, since its primary signification had two elements whose combination was variously explained. On the one hand, some kind of reference is made to the abstract entity health, which belongs to the category of quality; on the other hand, some kind of reference is made to an external object which belongs to the category of substance. This dual reference precludes the term from picking out a natural kind, though in the case of other adjectives, such as ‘brown’, no problem is caused thereby. Brown things may not form a natural kind, but at least they are all physical objects, and ‘brown’ is used in the same sense of each one. ‘Healthy’, however, is more complicated. To say that Rover is healthy is to say that Rover is a thing having health, and obviously this analysis can't be applied to diet, which is called healthy only because it causes health

in an animal, or to urine, which is called healthy only when it is the sign of health in an animal. Whatever the properties which characterize urine and food, they are different from those characterizing the animal.

5. Divisions of Analogy

Boethius's subdivisions had one major failure: they did not seem to accommodate the different uses of the word ‘being’ (*ens*). As a result, many authors used a new threefold division which included Boethius's last two subdivisions and one more. They presented the division as a division of deliberate equivocals, and they identified deliberate equivocals with analogical terms. This threefold division of analogy was established in the thirteenth-century, in response to a remark by Averroes in his commentary on the *Metaphysics* to the effect that Aristotle had classified ‘healthy’ as a case of relationship to one thing as an end, ‘medical’ as a case of relationship to one thing as an agent, and ‘being’ (*ens*) as a case of relationship to one subject. It is found in Thomas Aquinas's own commentary on the *Metaphysics*, as well as in his fifteenth-century follower Capreolus. An analogical term is now seen as one which is said of two things in a prior and a posterior sense, and it is grounded in various kinds of attribution or relationship to the primary object: food is healthy as a cause of a healthy animal, a procedure is medical when applied by a medical agent, a quality has being by virtue of the existent substance that it characterizes.

A second threefold division of analogy arose from reflection on the relationship between equivocal and analogical terms. Analogical terms were said to be intermediaries between equivocal and univocal terms, and the standard view was that analogical terms were intermediary between chance equivocals and univocals, and hence that they were to be identified with deliberate equivocals. The notion of an intermediary term, however, is open to more than one interpretation, and some authors went further in suggesting that at least some analogical terms were intermediary between univocals and deliberate equivocals, so that they were not equivocal in any of the normal senses at all. Towards the end of the thirteenth century, an anonymous commentator on the *Sophistical Refutations* gives the following classification. First, there are analogical terms which are univocal in a broad sense of ‘univocal’. Here reference was made to genus terms such as ‘animal’. Human beings and donkeys participate equally in the common nature animal, but are not themselves equal, since human beings are more perfect than donkeys. This type of analogy was routinely discussed in response to a remark Aristotle had made in *Physics* VII (249a22-25) which, in Latin translation, asserted that many equivocations are hidden in a genus. Medieval logicians felt obliged to fit this claim into the framework of equivocation and analogy, even if the consensus was that in the end the use of genus terms was univocal. Second, there are those analogical terms such as ‘being’ (*ens*) which are not equivocal, because only one concept or nature (*ratio*) seems to be involved, and which are not univocal either, because things participate this one ratio unequally, in a prior and a posterior way. It is these terms which are the genuine intermediaries. Third, there are those analogical terms which are deliberate equivocals, because there are two concepts or natures (*rationes*) which are participated in a prior and a posterior way. The example here was ‘healthy’. This second threefold division was much discussed. Duns Scotus bitterly criticized it in his earlier logical writings. Walter Burley claimed that both the first and the second kinds of analogical term could properly be regarded as univocal in a wide sense. The division was popular in the fifteenth century with such

Thomists as Capreolus, who realized its closeness to the account given by Aquinas in his *Sentences* commentary.

6. Thomas Aquinas

Despite the vast modern literature devoted to Aquinas's theory of analogy, he has very little to say about analogy as such. He uses a general division into equivocal, univocal, and analogical uses of terms, and he presents both of the threefold divisions of analogy mentioned in the previous section, but he offers no prolonged discussion, and he writes as if he is simply using the divisions, definitions, and examples with which everyone is familiar. His importance lies in the way he used this standard material to present an account of the divine names, or how it is we can meaningfully use such words as ‘good’ and ‘wise’ of God.

The background to this account has to be understood in terms of Aquinas's theology and metaphysics. Three doctrines are particularly important. First, there is the distinction between being existent, good, wise, and so on, essentially, and being existent, good, wise, and so on, by participation. God is whatever he is essentially, and as a result he is existence itself, goodness itself, wisdom itself. Creatures are existent, good, wise, only by sharing in God's existence, goodness, and wisdom, and this sharing has three features. It involves a separation between the creature and what the creature has; it involves a deficient similarity to God; and it is based on a causal relation. What is essentially existent or good is the cause of what has existence or goodness by participation. Second, there is the general doctrine of causality according to which every agent produces something like itself. Agent causality and similarity cannot be separated. Third, there is Aquinas's belief that we are indeed entitled to claim that God is existent, good, wise, and so on, even though we cannot know his essence.

Against this background, Aquinas asks how we are to interpret the divine names. He argues that they cannot be purely equivocal, for we could not then make intelligible claims about God. Nor can they be purely univocal, for God's manner of existence and his relationship to his properties are sufficiently different from ours that the words must be used in somewhat different senses. Hence, the words we use of God must be analogical, used in different but related senses. To be more precise, it seems that such words as ‘good’ and ‘wise’ must involve a relationship to one prior reality, and they must be predicated in a prior and a posterior sense, for these are the marks of analogical terms.

Nonetheless, the divine names do not function exactly like ordinary analogical terms such as ‘healthy’. We need to begin by making use of the distinction between the thing signified (a nature or property) and the mode of signifying. All the words we use have a creaturely mode of signifying in that they imply time and composition, neither of which can pertain to God. When speaking of God, we must recognize this fact, and attempt to discount it. To say "God is good" is not to imply that God has a separable property, goodness, and that he has it in a temporally limited way. God is eternally identical to goodness itself. But even when we have discounted the creaturely mode of signifying, we are left with the fact that God's goodness is not like our goodness. This is where the analogy of attribution enters the picture.

In his early writings, Aquinas questioned whether the standard account of the analogy of attribution was sufficient for his purposes. In his commentary on the *Sentences*, he suggests that there is one kind of analogy in which the analogical term is used in a prior and a posterior sense, and another kind of analogy, the analogy of imitation, which applies to God and creatures. In his *De veritate*, he argues that the analogy of attribution involves a determinate relation, which cannot hold between God and creatures, and that the analogy of proportionality must be used for the divine names. We must compare the relation between God and his properties to the relation between creatures and their properties. This solution was deeply flawed, given that the problem of divine names arises precisely because the relationship of God to his properties is so radically different from our relation to our properties. Accordingly, in his later discussions of the divine names, notably in the *Summa contra gentiles* and the *Summa theologiae*, Aquinas returns to the analogy of attribution, but links it much more closely with his doctrines of causal similitude. As Montagnes has pointed out, he came to place much greater emphasis on agent causation, the active transmission of properties from God to creatures, than on exemplar causality, the creature's passive reflection or imitation of God's properties. In this context, Aquinas makes considerable use of his ontological distinction between univocal causes, whose effects are fully like them, and non-univocal causes, whose effects are not fully like them. God is an analogical cause, and this is the reality that underlies our use of analogical language.

Aquinas's views about agent causality explain his insistence on definitional inclusion He says explicitly that the term said in a prior way must be included in the definition of the posterior, just as the definition of healthy food includes a reference to the health of the animal. In the divine case, the reference is not direct or explicit, but is a function of our recognition that when humans are said to be good, this means that they have a participated goodness which must be caused by that which is goodness itself. The nature of this causal relation between God and creature also helps to explain the sense in which terms are said in a prior way of God. So far as imposition is concerned, terms are given their signification on the basis of creaturely effects, and, before we learn about God, we may think that their prior use is to refer to creaturely perfections. However, when we come to know God as the first cause and fully perfect being, we recognize that their prior application is to God. Finally, Aquinas's causal doctrines help us to explain his insistence on the distinction between the analogy of many-to-one and the analogy of one-to-another. In the first case, both food and medicine are said to be healthy because each is related to something else, the health of an animal. In the second case, food is said to be healthy because of its relation to the health of an animal. Only the second kind of analogy applies to the divine names, for no non-metaphorical name we apply to God can ever be explained in terms of something other than God. Our use of divine names has to reflect God's absolute priority.

7. John Duns Scotus and the Role of Concepts

One of the issues that Aquinas touched on but did not settle was that of the number of *rationes* an analogical term was associated with. This issue stemmed from Aristotle's *Categories*. As translated by Boethius, Aristotle introduced the distinction between univocal and equivocal terms by claiming that whereas univocal terms were subordinated to one *substantiae ratio*, equivocal terms were subordinated to more than one *substantiae ratio*. The word ‘*ratio*’ here is capable of various interpretations, including

‘definition or description’, ‘analysis’, or ‘concept’, but by the early fourteenth century logicians and theologians came to agree that the appropriate interpretation was ‘concept’. The second threefold division of analogy given above suggests the importance of a focus on concepts; and the question of how many concepts an analogical term was subordinated to came to be central. The nominalists held that analogical terms were straightforwardly equivocal terms subordinated to two distinct concepts but the Thomists were split. Analogical terms could be viewed as subordinated to an ordered cluster of concepts (possibly but not necessarily described as a disjunction of concepts); or they could be subordinated to a single concept which represents in a prior and a posterior manner (*per prius et posterius*).

The issue was considerably complicated by the influence of John Duns Scotus and his argument that ‘being’ was not analogical but univocal. Scotus believed that without a unified conception of being, theology as a science would be impossible, and we would have no natural knowledge of God. Accordingly, he rejected the view that for a term to be univocal it had to be a strictly categorial term, picking out some natural kind or other. He argued that it was sufficient for univocity that contradiction would arise when the term was affirmed and denied of the same thing. He then argued that ‘being’ (*ens*) was a univocal term subordinated to a single univocal concept. Even for those within the Thomistic tradition, Scotus' arguments about the univocity of ‘being’ had to be taken seriously. On the one hand, the word does not seem to be straightforwardly equivocal, in the sense of being subordinated to more than one concept, for we at least have the illusion of being able to grasp ‘being’ as a general term. As Scotus pointed out, in an argument reproduced by all who considered the issue, we can grasp that something is a being while doubting whether it is a substance or an accident, and this surely involves having a relatively simple concept of being at our disposal. On the other hand, there does not seem to be any common nature involved, and in the absence of a common nature, Thomists thought that to call the term ‘univocal’ was inappropriate. What was needed was a way of allowing the concept to enjoy some kind of unity, while allowing the word to have a significate that was not a simple common nature. For many thinkers from the early fourteenth century onward, the distinction between formal and objective concepts provided the answer.

The formal concept was the act of mind or conception that represented an object, and the objective concept was the object represented. If the spoken word ‘being’ corresponds to just one formal concept (a point on which there were some differences of opinion), the focus of discussion shifts to the status of the objective concept. Is it the actual thing in the world which is thought about; is it a common nature or some other kind of intermediary entity which is distinct from the external object without being mind-dependent; or is it a special kind of mind-dependent object which has only objective being, the being of being thought (*esse objective*, *esse cognitum*)? In the case of ‘being’, since we are clearly not talking about either an individual thing or a common nature, we get back to the original set of questions about analogical concepts, now posed at a different level. That is, are we talking about a special ordering intrinsic to a single objective concept, or are we talking about an ordered sequence of objective concepts which corresponds to the one formal concept?

8. Cardinal Cajetan: A New Approach

In 1498 Thomas de Vio, Cardinal Cajetan, wrote a little book called *On the Analogy of Names* which he intended to supplement his commentary on Aristotle's *Categories*. The book rapidly became very popular, and it had a significant effect on subsequent discussions of analogy. Part of the work is devoted to formal and objective concepts and ways in which the latter can be ordered, but Cajetan also offered a new account of types of analogy. He began by presenting the second threefold division. He called the first type of analogy, the case of genus terms, the analogy of inequality, and dismissed it as unimportant, indeed, not properly analogy at all. He called the second type the analogy of attribution, and here he made two changes. First, he gave a new account of its subdivisions by adding Boethius's subdivision, similitude, to the first threefold division involving attribution to one efficient cause, one end, and one subject. He described the resulting four subdivisions in terms of Aristotle's four causes. Second, he claimed that attribution involved only extrinsic denomination. That is, in each case of attribution, only the prior object is intrinsically characterized by the property in question, e.g., health.

He called the third type of analogy the analogy of proportionality. It included metaphor and what he called proper proportionality. The latter, he said, is analogy in the Greek sense of the word, and is the only true kind of analogy. Moreover, it involves only intrinsic denomination: both the primary and the secondary object referred to are characterized by the property in question. While the word ‘being’ can be used in accordance with attribution, Cajetan claimed that it, and all other metaphysically significant analogical terms, principally belonged in this last division. Both in his insistence on the priority of the analogy of proper proportionality and in his use of the distinction between intrinsic and extrinsic denomination, Cajetan departed from earlier medieval discussions of analogy. Unfortunately, many later commentators have been misled into taking his account as a typical one, and, even more unfortunately, as a useful summary of the doctrines of Aquinas.

John Duns Scotus

John Duns Scotus (1265/66-1308) was one of the most important and influential philosopher-theologians of the High Middle Ages. His brilliantly complex and nuanced thought, which earned him the nickname "the Subtle Doctor," left a mark on discussions of such disparate topics as the semantics of religious language, the problem of universals, divine illumination, and the nature of human freedom. This essay first lays out what is known about Scotus's life and the dating of his works. It then offers an overview of some of his key positions in four main areas of philosophy: natural theology, metaphysics, the theory of knowledge, and ethics and moral psychology.

1. Life and Works

1.1 The life of John Duns the Scot

‘Scotus’ is a nickname: it identifies Scotus as a Scot. His family name was Duns, which was also the name of the Scottish village in which he was born, just a few miles from the English border. We do not know the precise date of his birth, but we do know that Scotus was ordained to the priesthood in the Order of Friars Minor -- the Franciscans -- at Saint Andrew's Priory in Northampton, England, on 17 March 1291. The minimum age for ordination was twenty-five, so we can conclude that Scotus was born before 17 March 1266. But how much before? The conjecture, plausible but by no means certain, is that Scotus would have been ordained as early as canonically permitted. Since the Bishop of Lincoln (the diocese that included Oxford, where Scotus was studying, as well as St Andrew's Priory) had ordained priests in Wycombe on 23 December 1290, we can place Scotus's birth between 23 December 1265 and 17 March

1266.

It appears that Scotus began his formal studies at Oxford in October 1288 and concluded them in June 1301. In the academic year 1298-99 he commented on the *Sentences* of Peter Lombard. We know that by the fall of 1302 Scotus was lecturing on the *Sentences* in Paris. In June 1303 Scotus was expelled from France along with eighty other friars for taking the Pope's side in a dispute with the king. They were allowed to return in April 1304; it appears that Scotus completed his lectures on the *Sentences* not long thereafter. On 18 November 1304 Scotus was appointed the Franciscan regent master in theology at Paris. For reasons no one quite understands, Scotus was transferred to the Franciscan *studium* at Cologne, probably beginning his duties as lector in October 1307. He died there in 1308; the date of his death is traditionally given as 8 November.

1.2 Scotus's works

It is generally agreed that Scotus's earliest works were his "*parva logicalia*" (little logical works): questions on Porphyry's *Isagoge* and Aristotle's *Categories*, *Peri hermeneias*, and *De sophisticis elenchis*. These probably date to around 1295; the possibly inauthentic *Quaestiones super De anima* is also very likely an early work. Scotus's other Aristotelian commentary, the *Quaestiones subtilissimae super Metaphysicam Aristotelis*, seems to have been started early; but Book 9 is probably late, and it is possible that Books 6 through 9 are all late or were at least revised later in Scotus's career.

Things really get complicated when we come to Scotus's commentaries on the four books of *Sentences* of Peter Lombard, since it appears that he commented on the *Sentences* on several occasions, and the relations among the various versions are not always clear. Certainly the *Lectura* presents us with Scotus's notes for his Oxford lectures on Books 1 and 2 of the *Sentences* in 1298-99 (or possibly 1300-01). There is a *Reportatio* (i.e., a transcript based on student notes) of lectures at Cambridge; this probably dates to some time between 1297 and 1300. (It has never been critically edited and exists in only three manuscripts.) There is an *Ordinatio* (i.e., a version prepared for publication by the author himself) of lectures at Oxford, based in part on the *Lectura* and on material from his lectures in Paris. The *Ordinatio* is generally taken to be Scotus's premier work, but unfortunately the critical edition is nowhere near complete (at this time it extends through Book 2, distinction 3). Scotus seems to have been revising it up to his death. Finally, Scotus lectured on the *Sentences* several times at Paris, and there are various *Reportationes* of these lectures, all dating from the period 1302-1307. Easily the most important is the *Reportatio examinata* of Book 1; the designation *examinata* indicates that it was examined and corrected by Scotus himself. Unfortunately it has never been critically edited.

In addition to these works, we have 46 short disputations called *Collationes* dating from 1300-1305, a late work in natural theology called *De primo principio*, and *Quaestiones Quodlibetales* from Scotus's days as regent master (either Advent 1306 or Lent 1307). Finally, there is a work of dubious authenticity called *Theoremata*.

2. Natural Theology

2.1 Some methodological preliminaries

Natural theology is, roughly, the effort to establish the existence and nature of God by arguments that in no way depend on the contents of a purported revelation. But is it even *possible* for human beings to come to know God apart from revelation? Scotus certainly thinks so. Like any good Aristotelian, he thinks all our knowledge begins in some way with our experience of sensible things. But he is confident that even from such humble beginnings we can come to grasp God.

Scotus agrees with Thomas Aquinas that all our knowledge of God starts from creatures, and that as a result we can only prove the existence and nature of God by what the medievals call an argument *quia* (reasoning from effect to cause), not by an argument *propter quid* (reasoning from essence to characteristic). Aquinas and Scotus further agree that, for that same reason, we cannot know the essence of God in this life. The main difference between the two authors is that Scotus believes we can apply certain predicates univocally -- with exactly the same meaning -- to God and creatures, whereas Aquinas insists that this is impossible, and that we can only use analogical predication, in which a word as applied to God has a meaning different from, although related to, the meaning of that same word as applied to creatures. (See medieval theories of analogy for details.)

Scotus has a number of arguments for univocal predication and against the doctrine of analogy (*Ordinatio* 1, d. 3, pars 1, q. 1-2, nn. 26-55). One of the most compelling uses Aquinas's own view against him. Aquinas had said that all our concepts come from creatures. Scotus says, very well, where will that analogous concept come from? It can't come from anywhere. If all our concepts come from creatures (and Scotus doesn't deny this), then the concepts we apply to God will also come from creatures. They won't just be *like* the concepts that come from creatures, as in analogous predication; they will have to be *the very same* concepts that come from creatures, as in univocal predication. Those are the only concepts we can have -- the only concepts we can possibly get. So if we can't use the concepts we get from creatures, we can't use any concepts at all, and so we can't talk about God -- which is false.

Another argument for univocal predication is based on an argument from Anselm. Consider all predicates, Anselm says. Now get rid of the ones that are merely relatives, since no relative expresses the nature of a thing as it is in itself. (So we're not talking about such predicates as "supreme being" or "Creator," since even though those properly apply to God, they don't tell us anything about what God is in himself, only about how he is related to other things.) Now take the predicates that are left. Here's the test. Let *F* be our predicate-variable. For any *F*, either

> (a) It is in every respect better to be *F* than not to be *F*.
>
> ~or~
>
> (b) It is in some respect better to be not-*F* than *F*.

A predicate will fall into the second category if and only if it implies some sort of limitation or deficiency. Anselm's argument is that we can (indeed must) predicate of God every predicate that falls into the first category, and that we cannot predicate of God any predicate that falls into the second (except metaphorically, perhaps). Scotus agrees with Anselm on this point (as did Aquinas: see *SCG* I.30). Scotus has his own terminology for whatever it is in every respect better to be than not to be. He calls such things "pure perfections" (*perfectiones simpliciter*). A pure perfection is any predicate that does not imply limitation.

So Scotus claims that pure perfections can be predicated of God. But he takes this a step further than Anselm. He says that they have to be predicated *univocally* of God; otherwise the whole business of pure perfections won't make any sense. Here's the argument. If we are going to use Anselm's test, we must first come up with our concept -- say, of good. Then we check out the concept to see whether it is in every respect better to be good than not-good. We realize that it is, and so we predicate 'good' of God. That test obviously won't work unless it's the same concept that we're applying in both cases.

One can see this more clearly by considering the two possible ways in which one might deny that the same concept is applied to both God and creatures. One might say that the concept of the pure perfection applies only to creatures, and the concept we apply to God has to be something different; or one might try it the other way around and say that the concept of the pure perfection applies only to God, and the concept we apply to creatures has to be something different. Take the first possibility. If we come up with the idea of a pure perfection from creatures and don't apply the same concept to God, we're saying that we can come up with something that is in every respect better to be than not to be, but it doesn't apply to God. Such a view would destroy the idea that God is the greatest and most perfect being. So then one might try the second possibility: the concept of the pure perfection really applies only to God. Scotus points out that that can't be right either. For then the perfection we apply to creatures won't be the pure perfection any more, and so the creature wouldn't be better off for having this pseudo-perfection. But the whole way in which we came up with the idea of the pure perfection in the first place was by considering perfections in creatures -- in other words, by considering what features made creatures better in every respect. So this possibility gets the test backwards: it says that we have to start with knowing what features God has and thereby determining what is a pure perfection, but in fact we first figure out what the pure perfections are and thereby know what features God has.

Not only can we come up with concepts that apply univocally to God and creatures, we can even come up with a *proper* (distinctive) concept of God. Now in one sense we can't have a proper concept of God in this life, since we can't know his essence as a particular thing. We know God in the way that we know, say, a person we have heard about but have never met. That is, we know him through general concepts that can apply both to him and to other things. In another sense, though, we can have a proper concept of God, that is, one that applies only to God. If we take any of the pure perfections to the highest degree, they will be predicable of God alone. Better yet, we can describe God more completely by taking all the pure perfections in the highest degree and attributing them all to him.

But these are all composite concepts; they all involve putting two quite different notions together: 'highest' with 'good', 'first' with 'cause', and so on. Scotus says that we can come up with a relatively

simple concept that is proper to God alone, the concept of "infinite being." Now that concept might seem to be every bit as composite as "highest good" or "first cause," but it's really not. For "infinite being" is a concept of something essentially one: a being that has infinity (unlimitedness) as its intrinsic way of existing. I will return to the crucial role of the concept of infinite being in Scotus's natural theology after I examine his proof of the existence of God.

2.2 Proof of the existence of God

Scotus's argument for the existence of God is rightly regarded as one of the most outstanding contributions ever made to natural theology. The argument is enormously complex, with several sub-arguments for almost every important conclusion, and I can only sketch it here. (Different versions of the proof are given at *Lectura* 1, d. 2, q. 1, nn. 38-135; *Ordinatio* 1, d. 2, q. 1, nn. 39-190; *Reportatio* 1, d. 2, q. 1; and *De primo principio*.)

Scotus begins by arguing that there is a first agent (a being that is first in efficient causality). Consider first the distinction between essentially ordered causes and accidentally ordered causes. In an accidentally ordered series, the fact that a given member of that series is itself caused is accidental to that member's own causal activity. For example, Grandpa A generates a son, Dad B, who in turn generates a son of his own, Grandson C. B's generating C in no way depends on A -- A could be long dead by the time B starts having children. The fact that B was caused by A is irrelevant to B's own causal activity. That's how an accidentally ordered series of causes works.

In an essentially ordered series, by contrast, the causal activity of later members of the series depends essentially on the causal activity of earlier members. For example, my shoulders move my arms, which in turn move my golf club. My arms are capable of moving the golf club only because they are being moved by my shoulders.

With that distinction in mind, we can examine Scotus's argument for the existence of a first efficient cause:

(1) No effect can produce itself.
(2) No effect can be produced by just nothing at all.
(3) A circle of causes is impossible.
(4) Therefore, an effect must be produced by something else. (from 1, 2, and 3)
(5) There is no infinite regress in an essentially ordered series of causes.

(5a) It is not necessarily the case that a being possessing a causal power C possesses C in an imperfect way.
(5b) Therefore, it is possible that C is possessed without imperfection by some item.

- (5c) If it is not possible for any item to possess C without dependence on some prior item, then it is not possible that there is any item that possesses C without imperfection (since dependence is a kind of imperfection).
- (5d) Therefore, it is possible that some item possesses C without dependence on some prior item. (from 5b and 5c by modus tollens)
- (5e) Any item possessing C without dependence on some prior item is a first agent (i.e., an agent that is not subsequent to any prior causes in an essentially ordered series).
- (5f) Therefore, it is possible that something is a first agent. (from 5d and 5e)
- (5g) If it is possible that something is a first agent, something is a first agent. (For, by definition, if there were no first agent, there would be no cause that could bring it about, so it would not in fact be possible for there to be a first agent.)
- (5h) Therefore, something is a first agent (i.e., an agent that is not subsequent to any prior causes in an essentially ordered series -- Scotus still has to prove that there is an agent that is not subsequent to any prior causes in an accidentally ordered series either. That's what he does in step (6) below). (from 5f and 5g)

(6) It is not possible for there to be an accidentally ordered series of causes unless there is an essentially ordered series.

- (6a) In an accidentally ordered series, each member of the series (except the first, if there is a first) comes into existence as a result of the causal activity of a prior member of the series.
- (6b) That causal activity is exercised in virtue of a certain form.
- (6c) Therefore, each member of the series depends on that form for its causal activity.
- (6d) The form is not itself a member of the series.
- (6e) Therefore, the accidentally ordered series is essentially dependent on a higher-order cause.

(7) Therefore, there is a first agent. (from 4, 5, and 6)

Scotus then goes on to argue that there is an ultimate goal of activity (a being that is first in final causality), and a maximally excellent being (a being that is first in what Scotus calls "pre-eminence").

Thus he has proved what he calls the "triple primacy": there is a being that is first in efficient causality, in

final causality, and in pre-eminence. Scotus next proves that the three primacies are coextensive: that is, any being that is first in one of these three ways will also be first in the other two ways. Scotus then argues that a being enjoying the triple primacy is endowed with intellect and will, and that any such being is infinite. Finally, he argues that there can be only one such being.

2.3 Divine infinity and the doctrine of univocity

In laying out Scotus's proof of the existence of God, I passed rather quickly over the claim that God is infinite. But the divine infinity deserves more detailed treatment. As we have already seen, the concept of "infinite being" has a privileged role in Scotus's natural theology. As a first approximation, we can say that divine infinity is for Scotus what divine simplicity is for Aquinas. It's the central divine-attribute generator. But there are some important differences between the role of simplicity in Aquinas and the role of infinity in Scotus. The most important, I think, is that in Aquinas simplicity acts as an ontological spoilsport for theological semantics. Simplicity is in some sense the key thing about God, metaphysically speaking, but it seriously complicates our language about God. God is supposed to be a subsistent simple, but because our language is all derived from creatures, which are all either subsistent but complex or simple but non-subsistent, we don't have any way to apply our language straightforwardly to God. The divine nature systematically resists being captured in language.

For Scotus, though, infinity is not only what's ontologically central about God, it's the key component of our best available concept of God and a guarantor of the success of theological language. That is, our best ontology, far from fighting with our theological semantics, both supports and is supported by our theological semantics. The doctrine of univocity rests in part on the claim that "[t]he difference between God and creatures, at least with regard to God's possession of the pure perfections, is ultimately one of degree" (Cross [1999], 39). Remember one of Scotus's arguments for univocity. If we are to follow Anselm in ascribing to God every pure perfection, we have to affirm that we are ascribing to God *the very same thing* that we ascribe to creatures: God has it infinitely, creatures in a limited way. One could hardly ask for a more harmonious cooperation between ontology (what God is) and semantics (how we can think and talk about him).

Scotus ascribes to Aquinas the following argument for the divine infinity: If a form is limited by matter, it is finite. God, being simple, is not limited by matter. Therefore, God is not finite. This, as Scotus points out, is a fallacious argument. (It's an instance of denying the antecedent.) But even apart from the fallacy, simplicity is not going to get us infinity. As Scotus puts it: "if an entity is finite or infinite, it is so not by reason of something accidental to itself, but because it has its own intrinsic degree of finite or infinite perfection" (*Ordinatio* 1, d. 1, pars 1, q. 1-2, n. 142). So simplicity does not entail infinity, because finitude is not the result of composition. To look at it another way, Aquinas's conception of infinity is *negative* and *relational*. The infinite is that which is *not bounded by something else*. But Scotus thinks we can have a positive conception of infinity, according to which infinity is not a negative, relational property, but instead a positive, intrinsic property. It is an "intrinsic degree of perfection."

How do we acquire that conception of positive, intrinsic infinity? The story goes like this. We begin with

"the potentially infinite in quantity." According to Aristotle, you can never have an actual quantitative infinity, since no matter how great a quantity you have, you can always have more. What you can have (and in fact do have, Aristotle thinks) is a quantitative infinity by successive parts. The next step is to imagine that all the parts of that quantitative infinity remained in existence simultaneously. That is, we imagine an actual quantitative infinity. Scotus then asks us to shift from thinking about an actual quantitative infinity to thinking about an actual *qualitative* infinity. Think of some quality (say, goodness) as existing infinitely: so that there is, as it were, no more goodness that you could add to that goodness to make it any greater. That's infinite goodness. But notice that you can't think of infinite goodness as in some way composed of little goodness-bits (just an infinite number of them). If I say that an angel is better than a human being, I can't mean that a human being has a certain number of goodness-bits while the angel has that many plus some extras. Rather, the specific degree of goodness of a thing is just an intrinsic, non-quantitative feature of that thing. Infinite being is just like that. Scotus describes it as "a measure of intrinsic excellence that is not finite." This is why the concept of "infinite being" is the simplest concept available to us for understanding God. Infinity is not some sort of accidental addition to being, but an intrinsic mode of being. Of course, if this is right, then the concepts of ‘infinite goodness’, ‘infinite power’, and so forth, are every bit as simple as the concept of ‘infinite being’. So why does Scotus make such a big deal about ‘infinite being’? Because ‘infinite being’ "virtually contains" all the other infinite perfections of God. That is, we can deduce the other infinite perfections from infinite being. So besides being the next best thing to a simple concept, it's the most theoretically fruitful concept we can have of God in this life.

3. Metaphysics

3.1 The subject matter of metaphysics

Metaphysics, according to Scotus, is a "real theoretical science": it is real in that it treats things rather than concepts, theoretical in that it is pursued for its own sake rather than as a guide for doing or making things, and a science in that it proceeds from self-evident principles to conclusions that follow deductively from them. The various real theoretical sciences are distinguished by their subject matter, and Scotus devotes considerable attention to determining what the distinctive subject matter of metaphysics is. His conclusion is that metaphysics concerns "being *qua* being" (*ens inquantum ens*). That is, the metaphysician studies being simply as such, rather than studying, say, material being as material.

The study of being *qua* being includes, first of all, the study of the transcendentals, so called because they transcend the division of being into finite and infinite, and the further division of finite being into the ten Aristotelian categories. Being itself is a transcendental, and so are the "proper attributes" of being -- one, true, and good -- which are coextensive with being. Scotus also identifies an indefinite number of disjunctions that are coextensive with being and therefore count as transcendentals, such as infinite-or-finite and necessary-or-contingent. Finally, all the pure perfections (see above) are transcendentals, since they transcend the division of being into finite and infinite. Unlike the proper attributes of being and the disjunctive transcendentals, however, they are not coextensive with being. For God is wise and Socrates is wise, but earthworms -- though they are certainly beings -- are not wise.

The study of the Aristotelian categories also belongs to metaphysics insofar as the categories, or the things falling under them, are studied as beings. (If they are studied as concepts, they belong instead to the logician.) There are exactly ten categories, Scotus argues. The first and most important is the category of substance. Substances are beings in the most robust sense, since they have an independent existence: that is, they do not exist *in* something else. Beings in any of the other nine categories, called accidents, exist in substances. The nine categories of accidents are quantity, quality, relation, action, passion, place, time, position, and state (*habitus*).

3.2 Matter and form, body and soul

Now imagine some particular substance, say, me. Suppose I go from being pale to being tan. Now it is still I who exist both before and after the sun has had its characteristic effect on me. This illustrates an important feature of substances: they can successively have contrary accidents and yet retain their numerical identity. This sort of change is known, appropriately enough, as accidental change. In an accidental change, a substance persists through the change, having first one accident and then another. But clearly not all changes are accidental changes. There was once a time when I did not exist, and then I came into existence. We can't analyze this change as an accidental change, since there doesn't seem to be any substance that persists through the change. Instead, a substance is precisely what comes into being; this is not an accidental but a *substantial* change. And yet there must be something that persists even through substantial change, since otherwise we wouldn't have change at all; substances would come to exist from nothing and disappear into nothing. Scotus follows Aristotle in identifying *matter* as what persists through substantial change and *substantial form* as what makes a given parcel of matter the definite, unique, individual substance that it is. (There are also accidental forms, which are a substance's accidental qualities.)

Thus far Scotus is simply repeating Aristotelian orthodoxy, and none of his contemporaries or immediate predecessors would have found any of this at all strange. But as Scotus elaborates his views on form and matter, he espouses three important theses that mark him off from some other philosophers of his day: he holds that there exists matter that has no form whatsoever, that not all created substances are composites of form and matter, and that one and the same substance can have more than one substantial form. Let us examine each of these theses in turn.

First, Scotus argues that there is matter that is entirely devoid of form, or what is known as "prime matter" (*Quaestiones in Metaphysicam* 7, q. 5; *Lectura* 2, d. 12, q. un.). Scholars debate now (just as they debated in Scotus's day) whether Aristotle himself really believed that there is prime matter or merely introduced it as a theoretical substratum for substantial change, believing instead that in actual fact matter always has at least some minimal form (the form of the elements being the most minimal of all). Aquinas denied both that Aristotle intended to posit it and that it could exist on its own. For something totally devoid of form would be utterly featureless; it would be pure potentiality, but not actually anything. Scotus, by contrast, argues that prime matter not only can but does exist as such: "it is one and the same stuff that underlies every substantial change" (King [forthcoming]).

Second, Scotus denies "universal hylemorphism," the view that all created substances are composites of form and matter (*Lectura* 2, d. 12, q. un., n. 55). Universal hylemorphism (from the Greek *hyle*, meaning ‘matter’, and *morphe*, meaning ‘form’) had been the predominant view among Franciscans before Scotus. Saint Bonaventure, for example, had argued that even angels could not be altogether immaterial; they must be compounds of form and "spiritual matter." For matter is potentiality and form is actuality, so if the angels were altogether immaterial, they would be pure actuality without any admixture of potentiality. But only God is pure actuality. But as we have already seen in his affirmation of the existence of prime matter, Scotus simply denies the unqualified equation of matter with potentiality and form with actuality. Prime matter, though entirely without form, is actual; and a purely immaterial being is not automatically bereft of potentiality.

Third, Scotus holds that some substances have more than one substantial form (*Ordinatio* 4, d. 11, q. 3, n. 54). This doctrine of the plurality of substantial forms was commonly held among the Franciscans but vigorously disputed by others. We can very easily see the motivation for the view by recalling that a substantial form is supposed to be what makes a given parcel of matter the definite, unique, individual substance that it is. Now suppose, as many medieval thinkers (including Aquinas) did, that the soul is the one and only substantial form of the human being. It would then follow that when a human being dies, and the soul ceases to inform that parcel of matter, what is left is not the same body that existed just before death. For what made it that very body was its substantial form, which (*ex hypothesi*) is no longer there. When the soul is separated from the body, then, what is left is not a body, but just a parcel of matter arranged corpse-wise. To Scotus and many of his fellow Franciscans it seemed obvious that the corpse of a person is the very same body that existed before death. Moreover, they argued, if the only thing responsible for informing the matter of a human being is the soul, it would seem that (what used to be) the body should immediately dissipate when a person dies. Accordingly, Scotus argues that the human being has at least two substantial forms. There is the "form of the body" (*forma corporeitatis*) that makes a given parcel of matter to be a definite, unique, individual human body, and the "animating form" or soul, which makes that human body alive. At death, the animating soul ceases to vivify the body, but numerically the same body remains, and the form of the body keeps the matter organized, at least for a while. Since the form of the body is too weak on its own to keep the body in existence indefinitely, however, it gradually decomposes.

While Scotus's account of form and matter has clear implications for what happens to the *body* at death, it is less forthcoming about what happens to the *soul*. Can the animating soul survive the death of the body it informs? Scotus considers a number of arguments for the incorruptibility of the human soul, but he finds none of them persuasive. This is not to say that he denies the immortality of the soul, of course, but that he does not think it can be proved by human reason unaided by revelation.

Note that the general tendency of Scotus's theories of form and matter is to allow a high degree of independence to form and matter. In positing the existence of prime matter, Scotus envisions matter as existing without any form; in denying universal hylpemorphism, he envision form as existing without any matter. And the doctrine of the plurality of substantial forms strongly suggests that the human soul is an identifiable individual in its own right. So everything Scotus says in this connection seems to make room for the *possibility* that the soul survives the death of the body and continues to exist as an immaterial

substance in its own right. That this possibility is in fact realized, however, is something we can know only through faith.

3.3 Universals and individuation

The problem of universals may be thought of as the question of what, if anything, is the metaphysical basis of our using the same predicate for more than one distinct individual. Socrates is human and Plato is human. Does this mean that there must be some one universal reality -- humanity -- that is somehow *repeatable*, in which Socrates and Plato both share? Or is there nothing metaphysically common to them at all? Those who think there is some actual universal existing outside the mind are called realists; those who deny extra-mental universals are called nominalists. Scotus was a realist about universals, and like all realists he had to give an account of what exactly those universals are: what their status is, what sort of existence they have outside the mind. So, in the case of Socrates and Plato, the question is "What sort of item is this humanity that both Socrates and Plato exemplify?" A related question that realists have to face is the problem of individuation. Given that there is some extra-mental reality common to Socrates and Plato, we also need to know what it is in each of them that makes them *distinct* exemplifications of that extra-mental reality.

Scotus calls the extra-mental universal the "common nature" (*natura communis*) and the principle of individuation the "haecceity" (*haecceitas*). The common nature is common in that it is "indifferent" to existing in any number of individuals. But it has extra-mental existence only *in* the particular things in which it exists, and in them it is always "contracted" by the haecceity. So the common nature *humanity* exists in both Socrates and Plato, although in Socrates it is made individual by Socrates's *haecceitas* and in Plato by Plato's *haecceitas*. The humanity-of-Socrates is individual and non-repeatable, as is the humanity-of-Plato; yet humanity itself is common and repeatable, and it is ontologically prior to any particular exemplification of it (*Ordinatio* 2, d. 3, pars 1, qq. 1-6, translated in Spade [1994], 57-113).

4. Theory of Knowledge

4.1 Sensation and abstraction

Scotus adopts the standard medieval Aristotelian view that human beings, alone among the animals, have two different sorts of cognitive powers: senses and intellect. The senses differ from the intellect in that they have physical organs; the intellect is immaterial. In order for the intellect to make use of sensory information, therefore, it must somehow take the raw material provided by the senses in the form of material images and make them into suitable objects for understanding. This process is known as abstraction, from the Latin *abstrahere*, which is literally "to drag out." The intellect pulls out the universal, as it were, from the material singular in which it is embedded. This activity is performed by the active or agent intellect, which takes the "phantasms" derived from sense experience and turns them into "intelligible species." Those species are actualized in the possible or receptive intellect, whose function is to receive and then store the intelligible species provided by the active intellect. Scotus denies that the

active and passive intellect are really distinct. Rather, there is one intellect that has these two distinct functions or powers.

Phantasms do not, however, become irrelevant once the intelligible species has been abstracted. Scotus holds (just as Aquinas had held) that the human intellect never understands anything without turning towards phantasms (*Lectura* 2, d. 3, pars 2, q. 1, n. 255). That is, in order to deploy a concept that has already been acquired, one must make some use of sensory data -- although the phantasms employed in using a concept already acquired need not be anything like the phantasms from which that concept was abstracted in the first place. I acquired the intelligible species of dog from phantasms of dogs, but I can make use of that concept now not only by calling up an image of a dog but also by (say) imagining the sound of the Latin word for dog. Scotus's point is simply that there must be some sensory context for any act of intellectual cognition.

And even that point is not quite as general as my unqualified statement suggests. For one thing, Scotus believes that our intellect's need for phantasms is a temporary state. It is only in this present life that the intellect must turn to phantasms; in the next life we will be able to do without them. For another thing, Scotus may have thought that even in this life we enjoy a kind of intellectual cognition that bypasses phantasms. He called it "intuitive cognition."

4.2 Intuitive cognition

Scotus understands intuitive cognition by way of contrast with abstractive cognition. The latter, as we have seen, involves the universal; and a universal as such need not be exemplified. That is, my intelligible species of dog only tells me what it is to be a dog; it doesn't tell me whether any particular dog actually exists. Intuitive cognition, by contrast, "yields information about how things are right now" (Pasnau [forthcoming]). Sensory cognition, as Scotus explicitly acknowledges, counts as intuitive cognition on this account. It is, after all, quite uncontroversial that my seeing or hearing a dog gives me information about some particular dog as it exists when I see or hear it. Scotus's much bolder claim concerns *intellectual* intuitive cognition, by which the intellect cognizes a particular thing as existing at that very moment. Intellectual intuitive cognition does not require phantasms; the cognized object somehow just causes the intellectual act by which its existence is made present to the intellect. As Robert Pasnau rightly notes, intellectual intuitive cognition is in effect a "form of extra-sensory perception" (Pasnau [forthcoming]).

In some places Scotus seems to think of this sort of intuitive cognition as a mere theoretical possibility, but in others he argues vigorously for the reality of intellectual intuitive cognition. Indeed, in the latter sorts of passages it becomes clear that intuitive cognition is quite pervasive in human thought. (For three different takes on what to make of Scotus's apparently conflicting signals on this matter, see Day [1947], Pasnau [forthcoming], and Wolter [1990a].) He argues, for example, that since the intellect engages in reasoning that makes reference to the actual existence of particular sensible objects, it must know that they exist. Abstractive cognition, of course, cannot provide such knowledge. Moreover, without intuitive cognition I could never know about my own intellectual states. Abstractive cognition could provide me

with an abstract concept of *thinking about Scotus*, but I need intuitive cognition to know that I am in fact exemplifying that concept right this minute.

If these arguments represent Scotus's considered views on intuitive cognition, then Scotus is making a bold exception to the general rule that in this life the intellect acquires knowledge only by turning to phantasms. It would seem that he has little choice, given the importance he attaches to our intuitive self-knowledge (as I discuss in the next section). For our intellect is immaterial, as are its acts, and it is difficult to see how an immaterial act can be captured in a sensory phantasm. Even so, Scotus is enough of an Aristotelian about the functioning of our intellect on this side of heaven to insist that even though our brute *acquaintance* with those acts is independent of phantasms, the *descriptions* under which we know those acts must be capable of being captured in a phantasm. And our intuitive cognition of extra-mental singulars extends only to *material* singulars, i.e., those that are capable of being captured in a phantasm. Scotus consistently denies that we can have intuitive cognition of non-sensible objects (such as angels) or universals in this life.

4.3 The attack on skepticism and illuminationism

Scotus argues that the human intellect is capable of achieving certainty in its knowledge of the truth simply by the exercise of its own natural powers, with no special divine help. He therefore opposes both skepticism, which denies the possibility of certain knowledge, and illuminationism, which insists that we need special divine illumination in order to attain certainty. He works out his attack on both doctrines in the course of a reply to Henry of Ghent in *Ordinatio* 1, d. 3, pars 1, q. 4. (For the text and translation, see Wolter [1987], 96-132.)

According to Henry, truth involves a relation to an "exemplar." (We can think of this relation as akin to the relation of correspondence appealed to by certain theories of truth, and the exemplar itself as the mental item that is one of the relata of the correspondence-relation. The other relatum, of course, is "the way things really are.") Now there are two exemplars: the created exemplar, which is the species of the universal caused by the thing known, and the uncreated exemplar, which is an idea in the divine mind. Henry argues that the created exemplar cannot provide us with certain and infallible knowledge of a thing. For, first, the object from which the exemplar is abstracted is itself mutable and therefore cannot be the cause of something immutable. And how can there be certain knowledge apart from some immutable basis for that knowledge? Second, the soul itself is mutable and subject to error, and it can be preserved from error only by something less mutable than itself. But the created exemplar is even more mutable than the soul. Third, the created exemplar by itself does not allow us to distinguish between reality and dreaming, since the content of the exemplar is the same in either case. Henry therefore concludes that if we are to have certainty, we must look to the uncreated exemplar. And since we cannot look to the uncreated exemplar by our natural powers, certainty is impossible apart from some special divine illumination.

Scotus argues that if Henry is right about the limitations of our natural powers, even divine illumination is not enough to save us from pervasive uncertainty. To Henry's first argument he replies that there is no

certainty to be had by knowing a mutable object as immutable. To the second he replies that anything in the soul -- including the very act of understanding that Henry thinks is achieved through illumination -- is mutable. So by Henry's argument it would be impossible for anything whatever to preserve the soul from error. And to the third argument he replies that if the created exemplar is such as to preclude certainty, adding extra exemplars will not solve the problem: "When something incompatible with certainty concurs, certainty cannot be attained" (*Ordinatio* 1, d. 3, pars 1, q. 4, n. 221).

So Henry's arguments, far from showing that certainty is possible through divine illumination, actually lead to a pervasive skepticism. Scotus counters that we can show that skepticism is false. We can in fact attain certainty, and we can do so by the unaided exercise of our natural intellectual powers. There are four types of knowledge in which infallible certainty is possible. First, knowledge of first principles is certain because the intellect has only to form such judgments to see that they are true. (And since the validity of proper syllogistic inference can be known in just this way, it follows that anything that is seen to be properly derived from first principles by syllogistic inference is also known with certainty.) Second, we have certainty with respect to quite a lot of causal judgments derived from experience. Third, Scotus says that many of our own acts are as certain as first principles. It is no objection to point out that our acts are contingent, since some contingent propositions must be known immediately (that is, without needing to be derived from some other proposition). For otherwise, either some contingent proposition would follow from a necessary proposition (which is impossible), or there would be an infinite regress in contingent propositions (in which case no contingent proposition would ever be known). Fourth, certain propositions about present sense experience are also known with certainty if they are properly vetted by the intellect in light of the causal judgments derived from experience.

5. Ethics and Moral Psychology

5.1 The natural law

For Scotus the natural law in the strict sense contains only those moral propositions that are *per se notae ex terminis* along with whatever propositions can be derived from them deductively (*Ordinatio* 3, d. 37, q. un.). *Per se notae* means that they are self-evident; *ex terminis* adds that they are self-evident in virtue of being analytically true. Now one important fact about propositions that are self-evident and analytically true is that God himself can't make them false. They are necessary truths. So the natural law in the strict sense does not depend on God's will. This means that even if (as I believe) Scotus is some sort of divine-command theorist, he is not whole-hog in his divine command theory. Some moral truths are necessary truths, and even God can't change those. They would be true no matter what God willed.

Which ones are those? Scotus's basic answer is that they are the commandments of the first tablet of the Decalogue (Ten Commandments). The Decalogue has often been thought of as involving two tablets. The first covers our obligations to God and consists of the first three commandments: *You shall have no other gods before me*, *You shall not take the name of the Lord your God in vain*, and *Remember the Sabbath day to keep it holy*. (Note that many Protestants divide them up differently.) The second tablet spells out our obligations toward others: *Honor your father and mother*, *You shall not kill*, *You shall not commit*

adultery, *You shall not steal*, *You shall not bear false witness against your neighbor*, and two commandments against coveting. The commandments of the first tablet are part of the natural law in the strict sense because they have to do with God himself, and with the way in which God is to be treated. For Scotus says that the following proposition is *per se nota ex terminis*: "If God exists, then he is to be loved as God, and nothing else is to be worshiped as God, and no irreverence is to be done to him." Given the very definition of God, it follows that if there is such a being, he is to be loved and worshiped, and no irreverence should be shown to him. Because these commandments are self-evident and analytic, they are necessary truths. Not even God himself could make them false.

But even the first three commandments, once we start looking at them, are not obviously part of the natural law in the strict sense. In particular, the third commandment, the one about the Sabbath day, is a little tricky. Obviously, the proposition "God is to be worshiped on Saturday" is not self-evident or analytic. In fact, Scotus says it's not even true any more, since Christians are to worship on Sunday, not Saturday. So, Scotus asks, what about the proposition "God is to be worshiped at some time or other"? Even that is not self-evident or analytic. The best one can do is "God is not to be hated." Now that's self-evident and analytic, since by definition God is the being most worthy of love and there is nothing in him worthy of hate. But obviously that's far weaker than any positive commandment about whether and when we should worship God.

So by the time Scotus completes his analysis, we are left with nothing in the natural law in the strict sense except for negative propositions: God is not to be hated, no other gods are to be worshiped, no irreverence is to be done to him. Everything else in the Decalogue belongs to the natural law in a weaker or looser sense. These are propositions that are not *per se notae ex terminis* and do not follow from such propositions, but are "highly consonant" with such propositions. Now the important point for Scotus is this: since these propositions are contingent, they are completely up to God's discretion. Any contingent truth whatsoever depends on God's will.

According to Scotus, God of course is aware of all contingent propositions. Now God gets to assign the truth values to those propositions. For example, "Unicorns exist" is a contingent proposition. Therefore, it is up to God's will whether that proposition will be true or false. The same goes for contingent moral propositions. Take any such proposition and call it *L*, and call the opposite of *L*, not-*L*. Both *L* and not-*L* are contingent propositions. God can make either of them true, but he can't make both of them true, since they are contradictories. Suppose that God wills *L*. *L* is now part of the moral law. How do we explain why God willed *L* rather than not-*L*? Scotus says we can't. God's will with respect to contingent propositions is unqualifiedly free. So while there might be some reasons why God chose the laws he chose, there is no fully adequate reason, no total explanation. If there were a total explanation other than God's will itself, those propositions wouldn't be contingent at all. They would be necessary. So at bottom there is simply the sheer fact that God willed one law rather than another.

Scotus intends this claim to be exactly parallel to the way we think about contingent beings. Why are there elephants but no unicorns? As everyone would agree, it's because God willed for there to be elephants but no unicorns. And why did he will that? He just did. That's part of what we mean by saying that God was free in creating. There was nothing constraining him or forcing him to create one thing

rather than another. The same is true about the moral law. Why is there an obligation to honor one's parents but no such obligation toward cousins? Because God willed that there be an obligation to honor one's parents, and he did not will that there be any such obligation toward one's cousins. He could have willed both of these obligations, and he could have willed neither. What explains the way that he did in fact will? Nothing whatsoever except the sheer fact that he did will that way.

5.2 The will, freedom, and morality

Scotus quite self-consciously puts forward his understanding of freedom as an alternative to Aquinas's. According to Aquinas, freedom comes in simply because the will is intellectual appetite rather than mere sense appetite. Intellectual appetite is aimed at objects as presented by the intellect and sense appetite at objects as presented by the senses. Sense appetite is not free because the senses provide only particulars as objects of appetite. But intellectual appetite is free because the intellect deals with universals, not particulars. Since universals by definition include many particulars, intellectual appetite will have a variety of objects. Consider goodness as an example. The will is not aimed at this good thing or that good thing, but at goodness in general. Since that universal, goodness, contains many different particular things, intellectual appetite has many different options.

But Scotus insists that mere intellectual appetite is not enough to guarantee freedom in the sense needed for morality. The basic difference comes down to this. When Aquinas argues that intellectual appetite has different options, he seems to be thinking of this over a span of time. Right now the intellect presents *x* as good, so I will *x*; but later on the intellect presents *y* as good, so then I will *y*. But Scotus thinks of freedom as involving multiple options at the very moment of choice. It's not enough to say that now I will *x*, but later I can will *y*. We have to say that at the very moment at which I will *x*, I also am able to will *y*. Aquinas's arguments don't show that intellectual appetite is free in this stronger sense. So as far as Scotus is concerned, Aquinas hasn't made room for the right kind of freedom.

This is where Scotus brings in his well-known doctrine of the two affections of the will (see especially *Ordinatio* 2, d. 6, q. 2; 2, d. 39, q. 2; 3, d. 17, q. un.; and 3, d. 26, q. un.). The two affections are fundamental inclinations in the will: the *affectio commodi*, or affection for the advantageous, and the *affectio iustitiae*, or affection for justice. Scotus identifies the *affectio commodi* with intellectual appetite. Notice how important that is. For Aquinas intellectual appetite is the same thing as will, whereas for Scotus intellectual appetite is only part of what the will is. Intellectual appetite is just one of the two fundamental inclinations in the will. Why does Scotus make this crucial change? For the reason we've already discussed. He doesn't see how intellectual appetite could be genuinely free. Now he can't deny that the will involves intellectual appetite. Intellectual appetite is aimed at happiness, and surely happiness does have some role to play in our moral psychology. But the will has to include something more than intellectual appetite if it's going to be free. That something more is the *affectio iustitiae*. But one can't fully understand what the *affectio iustitiae* is until Aquinas and Scotus are compared on a further point.

For Aquinas the norms of morality are defined in terms of their relationship to human happiness. We have a natural inclination toward our good, which is happiness, and it is that good that determines the content

of morality. So like Aristotle, Aquinas holds a eudaimonistic theory of ethics: the point of the moral life is happiness. That's why Aquinas can understand the will as an intellectual appetite for happiness. All of our choosing is aimed at the human good (or at least, it's aimed at the human good as we conceive it). And choices are good -- and, indeed, fully intelligible -- only when they are aimed at the ultimate end, which is happiness. So Aquinas just defines the will as the capacity to choose in accordance with a conception of the human good -- in other words, as intellectual appetite.

When Scotus rejects the idea that will is merely intellectual appetite, he is saying that there is something fundamentally wrong with eudaimonistic ethics. Morality is not tied to human flourishing at all. For it is Scotus's fundamental conviction that morality is impossible without libertarian freedom, and since he sees no way for there to be libertarian freedom on Aquinas's eudaimonistic understanding of ethics, Aquinas's understanding must be rejected. And just as Aquinas's conception of the will was tailor-made to suit his eudaimonistic conception of morality, Scotus's conception of the will is tailor-made to suit his anti-eudaimonistic conception of morality. It's not merely that he thinks there can be no genuine freedom in mere intellectual appetite. It's also that he rejects the idea that moral norms are intimately bound up with human nature and human happiness. The fact that God creates human beings with a certain kind of nature does not require God to command or forbid the actions that he in fact commanded or forbade. The actions he commands are not necessary for our happiness, and the actions he forbids are not incompatible with our happiness. Now if the will were merely intellectual appetite -- that is, if it were aimed solely at happiness -- we would not be able to choose in accordance with the moral law, since the moral law itself is not determined by any considerations about human happiness. So Scotus relegates concerns about happiness to the *affectio commodi* and assigns whatever is properly moral to the other affection, the *affectio iustitiae*.

Medieval Theories of Conscience

Through conscience and its related notion, synderesis, human beings discern what is right and wrong. While there are many medieval views about the nature of conscience, most views regard human beings as capable of knowing in general what ought to be done and applying this knowledge through conscience to particular decisions about action. The ability to act on the determinations of conscience is, moreover, tied to the development of the moral virtues, which in turn refines the functions of conscience.

Section 1: Background

Late medieval discussions of conscience derive from Peter Lombard's presentation of the concepts of conscience and synderesis in his *Sentences*. Lombard cites a passage from St. Jerome, interpreting Ezekiel's vision of four living creatures coming out of a cloud. Each creature was shaped like a man, but each had four faces: the front face was human; the right was that of a lion; the left was that of an ox; and the back was that of an eagle (Ezekiel 1.4-14). Jerome identifies the human face as representing the rational part of man, the lion as the emotional, the ox as the appetitive, and the eagle as that "which the Greeks call synteresis: that spark of conscience which was not even extinguished in the breast of Cain after he was turned out of paradise, and by which we discern that we sin, when we are overcome by pleasures or frenzy and meanwhile are misled by an imitation of reason." Jerome's comment that synteresis (alternatively, synderesis) is never extinguished in human beings and his remarks elsewhere to the effect that wicked people do cease to have any conscience led Lombard and subsequent thinkers to distinguish synderesis from conscience. While it is unclear that Jerome meant to distinguish the two, the distinction plays a major role in late medieval discussions of conscience.

In these discussions, constant reference was made to certain works by Plato and Aristotle. Neither Plato nor Aristotle explicitly mention conscience, however. It is their discussions of the virtues, practical wisdom, and weakness of will that form the critical backdrop to medieval discussions of conscience. These discussions were heavily influenced by Augustine's modification of these classical authors. For example, Augustine championed Plato's notion of the unity of the virtues, but he argued that love of God provided the unity to them. Moreover, he claimed that what pagan authors regarded as virtues were in fact vices unless they were developed for the love of God.

Two distinct views about the relationship between conscience and synderesis emerged in the late Middle Ages. The first view, a voluntaristic one, can be identified with Franciscan thinkers like Bonaventure. The second, most clearly expounded by Aquinas, is an intellectualistic view. Both seem to derive from Philip the Chancellor's treatise on conscience. In his treatise, Philip chiefly discusses synderesis, and at times he describes it as an unerring intellectual dispositional potentiality that provides general truths to conscience for specific application. At other times, he describes synderesis as the desire for the good, and it is equated with emotional reactions when one follows evil instead of good. This latter description fits well with Bonaventure's views on synderesis and conscience.

Section 2: Bonaventure

Bonaventure discusses both in his *Commentary on the Sentences*, Book II, distinction 39. He places conscience squarely within the rational faculty, specifying that it is part of practical reason since it is connected to the performance of actions. It is thus also connected to the will as well as the emotions. On the other hand, he places synderesis in the affective part of human beings, for he regards synderesis as that which stimulates us to the good.

Conscience is divided into two general parts by Bonaventure. The first part seems to be a power for discovering the truth of very general practical principles like "obey God," "honor your parents," and "do not harm your neighbors." This part of conscience is innate and unerring; it cannot be lost to any person, no matter how morally corrupt that person may become. The second part of conscience involves the application of the very general principles to situations that may be either general or particular. This second part is also innate, but it can be mistaken since the very general principles of the first part may be misapplied through ignorance or faulty reasoning. The misapplication explains, to a certain extent, how conscience, oriented to good, can be involved in the performance of evil actions. The distinction between the two parts of conscience also opens up the possibility for developing, through experience, practical principles of behavior not directly entailed by the content of the synderesis. By generalizing on activities performed in accordance with the principles of the synderesis, one can formulate new general principles not contained in the synderesis that can guide behavior in a number of contexts. Conscience thus appears to be a dynamic faculty for Bonaventure.

Bonaventure calls synderesis the "spark of conscience," and he sees it as resting in the affective part of human beings. It is the spark because, as the general drive to do good, synderesis provides the movement that conscience needs to operate. In general, Bonaventure regards conscience and synderesis as

interpenetrating one another. The formation of ethical rules by conscience is seen by him as an implementation of a human being's desire for good (the synderesis). He also sees the following of these principles as another aspect of the desire for good. Because we naturally have a desire for the good, we also desire the means to that goal. The principles of conscience are such means, and so we are naturally disposed to carry out the principles of conscience. Similarly, the emotional reaction to doing evil (guilt or remorse) is a reaction to the frustration of the desire for good caused when one fails to adhere to what the conscience has determined will lead to good. Bonaventure, while placing synderesis and conscience in different parts of a human being, does not isolate them. On the contrary, he views conscience as driven by synderesis and at the same time directing synderesis.

Section 3: Aquinas

Thomas Aquinas, the principal advocate of the intellectualistic view of the relationship of conscience and synderesis, explicitly defines ‘conscience’ as the "application of knowledge to activity" (*Summa Theologiae*, I-II, I) The knowledge he has in mind here comes from the synderesis, which he regards as the natural disposition of the human mind by which we apprehend without inquiry the basic principles of behavior. For Aquinas, then, the conscience applies the first principles of the synderesis to particular situations. The principles of synderesis are rather general in form. Examples are "Do good and avoid evil" and "Obey God." To be helpful in human activity, conscience requires principles that contain much more content. One can call these "secondary principles" and Aquinas discusses them in several places and suggests that they are derived from experience and instruction through the virtue of prudence. Thus, the function of conscience for Aquinas is to apply the general principles of synderesis and the more content-laden secondary principles developed from prudence to particular circumstances. Prudence is involved in the application to particular circumstances, according to Aquinas, because it is connected to the correct perception of individual circumstances. And this aspect of prudence connects both conscience and prudence to the problem of weakness of will.

In Aquinas's presentation of Aristotle's discussion of weakness of will in his Commentary on the *Nicomachean Ethics*, the fourth position offered in Book 7, Chapter 3 of the *Nicomachean Ethics* is emphasized. According to this position, the incontinent man knows the appropriate general principles of behavior concerning what should be done, e.g., one should not fornicate. If the incontinent man sees a particular action as falling under this general principle, e.g., a man sees that having intercourse with an unmarried woman is a case of fornication, he will not perform the action. However, the incontinent man also holds the general rule that pleasures should be enjoyed. If the incontinent man, driven by his particular desire for a particular unmarried woman, sees the proposed sexual liaison as a case of pleasure, he subsumes it under the general rule about pursuing pleasure and pursues the relationship. The desire he has, as it were, blinds him to the general principle about fornication he still possesses, but only habitually. The actual knowledge he possesses is that the proposed liaison is a case of pleasure to be pursued. He thus has (habitually) the knowledge that he should avoid fornication, but he fornicates nonetheless because he actually sees the fornication as an act of pleasure to be pursued. As a general comment on Aristotle's analysis, Aquinas remarks: "It is not the knowledge of the universal but only the evaluation of the sensible, which is not so excellent, that is dragged about by passion." (*Commentary on*

the Nicomachean Ethics, Book 7, lecture 3, paragraph 1352) The point Aquinas is making is that the incontinent man possesses the knowledge of what he should do, but he is driven by the passion he has for a particular; this passion leads him to act contrary to what the knows (habitually) should not be done. The incontinent man so fails because he has failed to cultivate the appropriate virtues that would enable him to size up the situation correctly (*synesis*) and deliberate well about it (*eubulia*). Aquinas's linking of conscience with prudence and the virtues in general through his concern with weakness of will is innovative and undoubtedly connected with his interest in the *Nicomachean Ethics*. Duns Scotus and William of Ockham follow his lead in linking conscience with issues surrounding development of the virtues.

Section 4: Scotus and Ockham

Scotus offers very little explicit discussion of either conscience or synderesis. Yet, from his discussion of issues chiefly concerned with development of the virtues, it is apparent that his view of conscience and synderesis seems to draw from both Bonaventure and Aquinas. Following Aquinas, Scotus thinks that both synderesis and conscience are to be placed in the intellectual order. In agreement with Bonaventure, Scotus gives conscience much more of a dynamic role in the human personality than a mechanical application of general principles. Scotus's close linking of conscience and the development of the virtues allows him to combine the two sources.

According to the virtue tradition, in order to perform a virtuous action, one must have the right dictates associated with the relevant virtue. Yet, one must perform appropriate virtuous actions to develop the habit of the virtue and to know the relevant right dictates. The obvious circularity seems vicious enough to undermine any attempt to cultivate virtues. Scotus regards conscience as offering a way into the circle. Whenever a person formulates what is to be done in some circumstance, this is an exercise of conscience, which has determined proper action from the principles of synderesis. On the basis of the dictates of conscience, a person can perform an action that will provide the basis for the development of the relevant virtues. For the performance of these acts from conscience leads to the type of habit that Scotus thinks of as a virtue. Ideally, the moral virtues are unified since a perfect, virtuous person should possess all virtues. In fact, Scotus's perfect, virtuous person seems very similar to Aristotle's man of practical wisdom. This is the person who has, through long experience, developed the moral virtues and is able to deliberate so well about all moral situations that in Aristotle's view to be moral is to do what a man of practical wisdom would do. Scotus's perfect, virtuous person, like the man of practical wisdom, is skilled at determining what should be done in given circumstances; he takes delight in acting in accord with his virtues, and he possesses all of the moral virtues by developing them through experience.

Ockham's discussion of conscience, prudence, and the virtues indicate that he follows Scotus's turn towards discussing conscience in relation to the virtues. He agrees with Scotus that conscience can provide the entry into the seeming circularity of performing virtuous actions in order to develop intentions that seem to be required for performing the virtuous actions in the first place. Nevertheless, he criticizes Scotus for failing to make a number of necessary distinctions about degrees of virtues and the relationship of conscience to prudence. He never mentions synderesis in his writings and emphasizes the

fact that only internal acts have moral worth. According to him, external acts are morally significant only by extrinsic denomination from internal acts. Particularly in these last two claims, Ockham exercised considerable influence on Reformation thinkers like Luther and Calvin in their discussions of conscience.

Aristotle's Ethics

Aristotle conceives of ethical theory as a field distinct from the theoretical sciences. Its methodology must match its subject matter - good action - and must respect the fact that in this field many generalizations hold only for the most part. We study ethics in order to improve our lives, and therefore its principal concern is the nature of human well-being. Aristotle follows Socrates and Plato in taking the virtues to be central to a well-lived life. Like Plato, he regards the ethical virtues (justice, courage, temperance and so on) as complex rational, emotional and social skills. But he rejects Plato's idea that a training in the sciences and metaphysics are a necessary prerequisite for a full understanding of our good. What we need, in order to live well, is a proper appreciation of the way in which such goods as friendship, pleasure, virtue, honor and wealth fit together as a whole. In order to apply that general understanding to particular cases, we must acquire, through proper upbringing and habits, the ability to see, on each occasion, which course of action is best supported by reasons. Therefore practical wisdom, as he conceives it, cannot be acquired solely by learning general rules. We also must also acquire, through practice, those deliberative, emotional, and social skills that enable us to put our general understanding of well-being into practice in ways that are suitable to each occasion.

---

1. Preliminaries

Aristotle wrote two ethical treatises: the *Nicomachean Ethics* and the *Eudemian Ethics*. He does not himself use either of these titles, although in the *Politics* (1295a36) he refers back to one of them -- probably the *Eudemian Ethics* -- as "*ta êthika*" -- his writings about character. The words "*Eudemian*" and "*Nicomachean*" were added later, perhaps because the former was edited by his friend, Eudemus, and the latter by his son, Nicomachus. In any case, these two works cover more or less the same ground: they begin with a discussion of *eudaimonia* ("happiness," "flourishing"), and turn to an examination of the nature of *aretê* ("virtue," "excellence") and the character traits that human beings need in order to live life at its best. Both treatises examine the conditions in which praise or blame are appropriate, and the nature of pleasure and friendship; near the end of each work, we find a brief discussion of the proper relationship between human beings and the divine.

Though the general point of view expressed in each work is the same, there are many subtle differences in organization and content as well. Clearly, one is a re-working of the other, and although no single piece of evidence shows conclusively what their order is, it is widely assumed that the *Nicomachean Ethics* is a later and improved version of the *Eudemian Ethics*. (Not all of the *Eudemian Ethics* was revised: its Books IV, V, and VI re-appear as V, VI, VII of the *Nicomachean Ethics*.) Perhaps the most telling indication of this ordering is that in several instances the *Nicomachean Ethics* develops a theme about which its *Eudemian* cousin is silent. Only the *Nicomachean Ethics* discusses the close relationship between ethical inquiry and politics; only the *Nicomachean Ethics* examines Solon's dictum that no man should be counted happy until he is dead; and only the *Nicomachean Ethics* gives a series of arguments for the superiority of the philosophical life to the political life. The remainder of this article will therefore focus on this work. [**Note**: Page and line numbers shall henceforth refer to this treatise.]

Although Aristotle is deeply indebted to Plato's moral philosophy, particularly Plato's central insight that moral thinking must be integrated with our emotions and appetites, and that the preparation for such unity of character should begin with childhood education, the systematic character of Aristotle's discussion of these themes was a remarkable innovation. No one had written ethical treatises before Aristotle. Plato's *Republic*, for example, does not treat ethics as a distinct subject matter; nor does it offer a systematic examination of the nature of happiness, virtue, voluntariness, pleasure, or friendship. To be sure, we can find in Plato's works important discussions of these phenomena, but they are not brought together and unified as they are in Aristotle's ethical writings.

2. The Human Good and the Function Argument

The principal idea with which Aristotle begins is that there are differences of opinion about what is best for human beings, and that to profit from ethical inquiry we must resolve this disagreement. He insists that ethics is not a theoretical discipline: we are asking what the good for human beings is not simply because we want to have knowledge, but because we will be better able to achieve our good if we develop a fuller understanding of what it is to flourish. In raising this question -- what is the good? -- Aristotle is not looking for a list of items that are good. He assumes that such a list can be compiled rather easily; most would agree, for example, that it is good to have friends, to experience pleasure, to be healthy, to be honored, and to have such virtues as courage at least to some degree. The difficult and controversial question arises when we ask whether certain of these goods are more desirable than others. Aristotle's search for *the* good is a search for the *highest* good, and he assumes that the highest good, whatever it turns out to be, has three characteristics: it is desirable for itself, it is not desirable for the sake of some other good, and all other goods are desirable for its sake.

Aristotle thinks everyone will agree that the terms "*eudaimonia*" ("happiness") and "*eu zên*" ("living well") designate such an end. The Greek term "*eudaimon*" is composed of two parts: "*eu*" means "well" and "*daimon*" means "divinity" or "spirit." To be *eudaimon* is therefore to be living in a way that is well-favored by a god. But Aristotle never calls attention to this etymology, and it seems to have little influence on his thinking. He regards "*eudaimon*" as a mere substitute for *eu zên* ("living well"). These terms play an evaluative role, and are not simply descriptions of someone's state of mind.

No one tries to live well for the sake of some further goal; rather, being *eudaimon is* the highest end, and all subordinate goals -- health, wealth, and other such resources -- are sought because they promote well-being, not because they are what well-being consists in. But unless we can determine which good or goods happiness consists in, it is of little use to acknowledge that it is the highest end. To resolve this issue, Aristotle asks what the *ergon* ("function," "task," "work") of a human being is, and argues that it consists in activity of the rational part of the soul in accordance with virtue (1097b22-1098a20). One important component of this argument is expressed in terms of distinctions he makes in his psychological and biological works. The soul is analyzed into a connected series of capacities: the nutritive soul is responsible for growth and reproduction, the locomotive soul for motion, the perceptive soul for perception, and so on. The biological fact Aristotle makes use of is that human beings are the only species that has not only these lower capacities but a rational soul as well. The good of a human being must have something to do with being human; and what sets humanity off from other species, giving us the potential to live a better life, is our capacity to guide ourselves by using reason. If we use reason well, we live well as human beings; or, to be more precise, using reason well over the course of a full life is what happiness consists in. Doing anything well requires virtue or excellence, and therefore living well consists in activities caused by the rational soul in accordance with virtue or excellence.

Aristotle's conclusion about the nature of happiness is in a sense uniquely his own. No other writer or thinker had said precisely what he says about what it is to live well. But at the same time his view is not too distant from a common idea. As he himself points out, one traditional conception of happiness identifies it with virtue (1098b30-1). Aristotle's theory should be construed as a refinement of this position. He says, not that happiness is virtue, but that it is virtuous *activity*. Living well consists in doing something, not just being in a certain state or condition. It consists in those lifelong activities that

actualize the virtues of the rational part of the soul.

At the same time, Aristotle makes it clear that in order to be happy one must possess others goods as well -- such goods as friends, wealth, and power. And one's happiness is endangered if one is severely lacking in certain advantages -- if, for example, one is extremely ugly, or has lost children or good friends through death (1098a31-b6). But why so? If one's ultimate end should simply be virtuous activity, then why should it make any difference to one's happiness whether one has or lacks these other types of good? Aristotle's reply is that one's virtuous activity will be to some extent diminished or defective, if one lacks an adequate supply of other goods (1153b17-19). Someone who is friendless, childless, powerless, weak, and ugly will simply not be able to find many opportunities for virtuous activity over a long period of time, and what little he can accomplish will not be of great merit. To some extent, then, living well requires good fortune; happenstance can rob even the most excellent human beings of happiness. Nonetheless, Aristotle insists, the highest good, virtuous activity, is not something that comes to us by chance. Although we must be fortunate enough to have parents and fellow citizens who help us become virtuous, we ourselves share much of the responsibility for acquiring and exercising the virtues.

3. Methodology

A. Traditional Virtues and the Skeptic.

A common complaint about Aristotle's attempt to defend his conception of happiness is that his argument is too general to show that it is in one's interest to possess any of the particular virtues as they are traditionally conceived. Suppose we grant, at least for the sake of argument, that doing anything well, including living well, consists in exercising certain skills; and let us call these skills, whatever they turn out to be, virtues. Even so, that point does not by itself allow us to infer that such qualities as temperance, justice, courage, as they are normally understood, are virtues. They should be counted as virtues only if it can be shown that actualizing precisely these skills is what happiness consists in. What Aristotle owes us, then, is an account of these traditional qualities that explains why they must play a central role in any well-lived life.

But perhaps Aristotle disagrees, and refuses to accept this argumentative burden. In one of several important methodological remarks he makes near the beginning of the *Nicomachean Ethics*, he says that in order to profit from the sort of study he is undertaking, one must already have been brought up in good habits (1095b4-6). The audience he is addressing, in other words, consists of people who already just, courageous, and generous; or, at any rate, they are well on their way to possessing these virtues. Why such a restricted audience? Why does he not address those who have serious doubts about the value of these traditional qualities, and who therefore have not yet decided to cultivate and embrace them?

Addressing the moral skeptic, after all, is the project Plato undertook in the *Republic*: in Book I he rehearses an argument to show that justice is not really a virtue, and the remainder of this work is an attempt to rebut this thesis. Aristotle's project seems, at least on the surface, to be quite different. He does not appear to be addressing someone who has genuine doubts about the value of justice or kindred

qualities. Perhaps, then, he realizes how little can be accomplished, in the study of ethics, to provide it with a rational foundation. Perhaps he thinks that no reason can be given for being just, generous, and courageous. These are qualities one learns to love when one is a child, and having been properly habituated, one no longer looks for or needs a reason to exercise them. One can show, as a general point, that happiness consists in exercising some skills or other, but that the moral skills of a virtuous person are what one needs is not a proposition that can be established on the basis of argument.

This is not the only way of reading the *Ethics*, however. For surely we cannot expect Aristotle to show what it is about the traditional virtues that makes them so worthwhile until he has fully discussed the nature of those virtues. He himself warns us that his initial statement of what happiness is should be treated as a rough outline whose details are to be filled in later (1098a20-22). His intention in Book I of the *Ethics* is to indicate in a general way why the virtues are important; why particular virtues -- courage, justice, and the like -- are components of happiness is something we should be able to better understand only at a later point.

In any case, Aristotle's assertion that his audience must already have begun to cultivate the virtues need not be taken to mean that no reasons can be found for being courageous, just, and generous. His point, rather, may be that in ethics, as in any other study, we cannot make progress towards understanding why things are as they are unless we begin with certain assumptions about what is the case. Neither theoretical nor practical inquiry starts from scratch. Someone who has made no observations of astronomical or biological phenomena is not yet equipped with sufficient data to develop an understanding of these sciences. The parallel point in ethics is that to make progress in this sphere we must already have come to enjoy doing what is just, courageous, generous and the like. We must experience these activities not as burdensome constraints, but as noble, worthwhile, and enjoyable in themselves. Then, when we engage in ethical inquiry, we can ask what it is about these activities that makes them worthwhile. We can also compare these goods with other things that are desirable in themselves -- pleasure, friendship, honor, and so on -- and ask whether any of them is more desirable than the others. We approach ethical theory with a disorganized bundle of likes and dislikes based on habit and experience; such disorder is an inevitable feature of childhood. But what is not inevitable is that our early experience will be rich enough to provide an adequate basis for worthwhile ethical reflection; that is why we need to have been brought up well. Yet such an upbringing can take us only so far. We seek a deeper understanding of the objects of our childhood enthusiasms, and we must systematize our goals so that as adults we have a coherent plan of life. We need to engage in ethical theory, and to reason well in this field, if we are to move beyond the low-grade form of virtue we acquired as children.

B. Differences and Affinities with Plato

Read in this way, Aristotle is engaged in a project similar in some respects to the one Plato carried out in the *Republic*. One of Plato's central points is that it is a great advantage to establish a hierarchical ordering of the elements in one's soul; and he shows how the traditional virtues can be interpreted to foster or express the proper relation between reason and less rational elements of the psyche. Aristotle's approach is similar: his "function argument" shows in a general way that our good lies in the dominance of reason, and the detailed studies of the particular virtues reveal how each of them involves the right kind of

ordering of the soul. Aristotle's goal is to arrive at conclusions similar to Plato's, but without relying on the Platonic metaphysics that plays a central role in the argument of the *Republic*. He rejects the existence of Plato's forms in general and the form of the good in particular; and he rejects the idea that in order to become fully virtuous one must study mathematics and the sciences, and see all branches of knowledge as a unified whole. Even though Aristotle's ethical theory sometimes relies on philosophical distinctions that are more fully developed in his other works, he never proposes that students of ethics need to engage in a specialized study of the natural world, or mathematics, or eternal and changing objects. His project is to make ethics an autonomous field, and to show why a full understanding of what is good does not require expertise in any other field.

There is another contrast with Plato that should be emphasized: In Book II of the *Republic*, we are told that the best type of good is one that is desirable both in itself and for the sake of its results (357d-358a). Plato argues that justice should be placed in this category, but since it is generally agreed that it is desirable for its consequences, he devotes most of his time to establishing his more controversial point -- that justice is to be sought for its own sake. By contrast, Aristotle assumes that if *A* is desirable for the sake of *B*, then *B* is better than *A* (1094a14-16); therefore, the highest kind of good must be one that is not desirable for the sake of anything else. To show that *A* deserves to be our ultimate end, one must show that all other goods are best thought of as instruments that promote *A* in some way or other. Accordingly, it would not serve Aristotle's purpose to consider virtuous activity in isolation from all other goods. He needs to discuss honor, wealth, pleasure, and friendship in order to show how these goods, properly understood, can be seen as resources that serve the higher goal of virtuous activity. He vindicates the centrality of virtue in a well-lived life by showing that in the normal course of things a virtuous person will not live a life devoid of friends, honor, wealth, pleasure, and the like. Virtuous activity makes a life happy not by guaranteeing happiness in all circumstances, but by serving as the goal for the sake of which lesser goods are to be pursued. Aristotle's methodology in ethics therefore pays more attention than does Plato's to the connections that normally obtain between virtue and other goods. That is why he stresses that in this sort of study one must be satisfied with conclusions that hold only for the most part (1094b11-22). Poverty, isolation, and dishonor are normally, impediments to the exercise of virtue and therefore to happiness, although there may be special circumstances in which they are not. The possibility of exceptions does not undermine the point that, as a rule, to live well is to have sufficient resources for the pursuit of virtue over the course of a lifetime.

4. Virtues and Deficiencies, Continence and Incontinence

Aristotle distinguishes two kinds of virtue (1103a1-10): those that pertain to the part of the soul that engages in reasoning (virtues of mind or intellect), and those that pertain to the part of the soul that cannot itself reason but is nonetheless capable of following reason (ethical virtues, virtues of character). Intellectual virtues are in turn divided into two sorts: those that pertain to theoretical reasoning, and those that pertain to practical thinking 1139a3-8). He organizes his material by first studying ethical virtue in general, then moving to a discussion of particular ethical virtues (temperance, courage, and so on), and finally completing his survey by considering the intellectual virtues (practical wisdom, theoretical

wisdom, etc.).

All free males are born with the potential to become ethically virtuous and practically wise, but to achieve these goals they must go through two stages: during their childhood, they must develop the proper habits; and then, when their reason is fully developed, they must acquire practical wisdom (*phronêsis*). This does not mean that first we fully acquire the ethical virtues, and then, at a later stage, add on practical wisdom. Ethical virtue is fully developed only when it is combined with practical wisdom (1144b14-17). A low-grade form of ethical virtue emerges in us during childhood as we are repeatedly placed in situations that call for appropriate actions and emotions; but as we rely less on others and become capable of doing more of our own thinking, we learn to develop a larger picture of human life, our deliberative skills improve, and our emotional responses are perfected. Like anyone who has developed a skill in performing a complex and difficult activity, the virtuous person takes pleasure in exercising his intellectual skills. Furthermore, when he has decided what to do, he does not have to contend with internal pressures to act otherwise. He does not long to do something that he regards as shameful; and he is not greatly distressed at having to give up a pleasure that he realizes he should forego.

Aristotle places those who suffer from such internal disorders into one of three categories: (A) Some agents, having reached a decision about what to do on a particular occasion, experience some counter-pressure brought on by an appetite for pleasure, or anger, or some other emotion; and this countervailing influence is not completely under the control of reason. (1) Within this category, some are typically better able to resist these counter-rational pressures than is the average person. Such people are not virtuous, although they generally do what a virtuous person does. Aristotle calls them "continent" (*enkratês*). But (2) others are less successful than the average person in resisting these counter-pressures. They are "incontinent" (*akratês*). (The explanation of *akrasia* is a topic to which we will return in section 8.) In addition, (B) there is a type of agent who refuses even to try to do what an ethically virtuous agent would do, because he has become convinced that justice, temperance, generosity and the like are of little or no value. Such people Aristotle calls evil (*kakos*, *phaulos*). He assumes that evil people are driven by desires for domination and luxury, and although they are single-minded in their pursuit of these goals, he portrays them as deeply divided, because their *pleonexia* -- their desire for more and more -- leaves them dissatisfied and full of self-hatred.

It should be noticed that all three of these deficiencies -- continence, incontinence, vice -- involve some lack of internal harmony. (Here Aristotle's debt to Plato is particularly evident, for one of the central ideas of the *Republic* is that the life of a good person is harmonious, and all other lives deviate to some degree from this ideal.) The evil person may wholeheartedly endorse some evil plan of action at a particular moment, but over the course of time, Aristotle supposes, he will regret his decision, because whatever he does will prove inadequate for the achievement of his goals (1166b5-29). Aristotle assumes that that when someone systematically makes bad decisions about how to live his life, his failures are caused by psychological forces that are less than fully rational. His desires for pleasure, power or some other external goal have become so strong that they make him care too little or not at all about acting ethically. To keep such destructive inner forces at bay, we need to develop the proper habits and emotional responses when we are children, and to reflect intelligently on our aims when we are adults. But some vulnerability to these disruptive forces is present even in more-or-less virtuous people; that is why even a

good political community needs laws and the threat of punishment. Clear thinking about the best goals of human life and the proper way to put them into practice is a rare achievement, because the human psyche is not a hospitable environment for the development of these insights.

5. The Doctrine of the Mean

A. Ethical Virtue as Disposition

Aristotle describes ethical virtue as a "*hexis*" ("state" "condition" "disposition") -- a tendency or disposition, induced by our habits, to have appropriate feelings (1105b25-6). Defective states of character are *hexeis* (plural of *hexis*) as well, but they are tendencies to have inappropriate feelings. The significance of Aristotle's characterization of these states as *hexeis* is his decisive rejection of the thesis, found throughout Plato's early dialogues, that virtue is nothing but a kind of knowledge and vice nothing but a lack of knowledge. Although Aristotle frequently draws analogies between the crafts and the virtues (and similarly between physical health and *eudaimonia*), he insists that the virtues differ from the crafts and all branches of knowledge in that the former involve appropriate emotional responses and are not purely intellectual conditions.

Furthermore, every ethical virtue is a condition intermediate between two other states, one involving excess, and the other deficiency (1106a26-b28). In this respect, Aristotle says, the virtues are no different from technical skills: every skilled worker knows how to avoid excess and deficiency, and is in a condition intermediate between two extremes. The courageous person, for example, judges that some dangers are worth facing and others not, and experiences fear to a degree that is appropriate to his circumstances. He lies between the coward, who flees every danger and experiences excessive fear, and the rash person, who judges every danger worth facing and experiences little or no fear. Aristotle holds that this same topography applies to every ethical virtue: all are located on a map that places the virtues between states of excess and deficiency. He is careful to add, however, that the mean is to be determined in a way that takes into account the particular circumstances of the individual (1106a36-b7). The arithmetic mean between 10 and 2 is 6, and this is so invariably, whatever is being counted. But the intermediate point that is chosen by an expert in any of the crafts will vary from one situation to another. There is no universal rule, for example, about how much food an athlete should eat, and it would be absurd to infer from the fact that 10 lbs. is too much and 2 lbs. too little for me that I should eat 6 lbs. Finding the mean in any given situation is not a mechanical or thoughtless procedure, but requires a full and detailed acquaintance with the circumstances.

It should be evident that Aristotle's treatment of virtues as mean states endorses the idea that we should sometimes have strong feelings -- when such feelings are called for by our situation. Sometimes a only a small degree of anger is appropriate; but at other times, circumstances call for great anger. The right amount is not some quantity between zero and the highest possible level, but rather the amount, whatever it happens to be, that is proportionate to the seriousness of the situation. Of course, Aristotle is committed to saying that anger should never reach the point at which it undermines reason; and this means that our passion should always fall short of the extreme point at which we would lose control. But it is possible to

be very angry without going to this extreme, and Aristotle does not intend to deny this.

The theory of the mean is open to several objections, but before considering them, we should recognize that in fact there are two distinct theses each of which might be called a doctrine of the mean. First, there is the thesis that every virtue is a state that lies between two vices, one of excess and the other of deficiency. Second, there is the idea that whenever a virtuous person chooses to perform a virtuous act, he can be described as aiming at an act that is in some way or other intermediate between alternatives that he rejects. It is this second thesis that is most likely to be found objectionable. A critic might concede that in some cases virtuous acts can be described in Aristotle's terms. If, for example, one is trying to decide how much to spend on a wedding present, one is looking for an amount that is neither excessive nor deficient. But surely many other problems that confront a virtuous agent are not susceptible to this quantitative analysis. If one must decide whether to attend a wedding or respect a competing obligation instead, it would not be illuminating to describe this as a search for a mean between extremes -- unless "aiming at the mean" simply becomes another phrase for trying to make the right decision. The objection, then, is that Aristotle's doctrine of the mean, taken as a doctrine about what the ethical agent does when he deliberates, is in many cases inapplicable or unilluminating.

A defense of Aristotle would have to say that the virtuous person does after all aim at a mean, if we allow for a broad enough notion of what sort of aiming is involved. For example, consider a juror who must determine whether a defendant is guilty as charged. He does not have before his mind a quantitative question; he is trying to decide whether the accused committed the crime, and is not looking for some quantity of action intermediate between extremes. Nonetheless, an excellent juror can be described as someone who, in trying to arrive at the correct decision, seeks to express the right degree of concern for all relevant considerations. He searches for the verdict that results from a deliberative process that is neither overly credulous or unduly skeptical. Similarly, in facing situations that arouse anger, a virtuous agent must determine what action (if any) to take in response to an insult, and although this is not itself a quantitative question, his attempt to answer it properly requires him to have the right degree of concern for his standing as a member of the community. He aims at a mean in the sense that he looks for a response that avoids too much or too little attention to factors that must be taken into account in making a wise decision.

Perhaps a greater difficulty can be raised if we ask how Aristotle determines which emotions are governed by the doctrine of the mean. Consider someone who loves to wrestle, for example. Is this passion something that must be felt by every human being at appropriate times and to the right degree? Surely someone who never felt this emotion to any degree could still live a perfectly happy life. Why then should we not say the same about at least some of the emotions that Aristotle builds into his analysis of the ethically virtuous agent? Why should we experience anger at all, or fear, or the degree of concern for wealth and honor that Aristotle commends? These are precisely the questions that were asked in antiquity by the Stoics, and they came to the conclusion that such common emotions as anger and fear are always inappropriate. Aristotle assumes, on the contrary, not simply that these common passions are sometimes appropriate, but that it is essential that every human being learn how to master them and experience them in the right way at the right times. A defense of his position would have to show that the emotions that figure in his account of the virtues are valuable components of any well-lived human life, when they are

experienced properly. Perhaps such a project could be carried out, but Aristotle himself does not attempt to do so.

He often says, in the course of his discussion, that when the good person chooses to act virtuously, he does so for the sake of the "*kalon*" -- a word that can mean "beautiful," "noble," or "fine." (See for example 1120a23-4.) This term indicates that Aristotle sees in ethical activity an attraction that is comparable to the beauty of well-crafted artifacts, including such artifacts as poetry, music, and drama. He draws this analogy in his discussion of the mean, when he says that every craft tries to produce a work from which nothing should be taken away and to which nothing further should be added (1106b5-14). A craft product, when well designed and produced by a good craftsman, is not merely useful, but also has such elements as balance, proportion and harmony -- for these are properties that help make it useful. Similarly, Aristotle holds that a well-executed project that expresses the ethical virtues will not merely be advantageous but *kalon* as well -- for the balance it strikes is part of what makes it advantageous. The young person learning to acquire the virtues must develop a love of doing what is *kalon* and a strong aversion to its opposite -- the *aischron*, the shameful and ugly. Determining what is *kalon* is difficult (1106b28-33, 1109a24-30, and the normal human aversion to embracing difficulties helps account for the scarcity of virtue (1104b10-11).

B. Ethical Theory Does Not Offer a Decision Procedure

It should be clear that neither the thesis that virtues lie between extremes nor the thesis that the good person aims at what is intermediate is intended as a procedure for making decisions. These doctrines of the mean help show what is attractive about the virtues, and they also help systematize our understanding of which qualities are virtues. Once we see that temperance, courage, and other generally recognized characteristics are mean states, we are in a position to generalize and to identify other mean states as virtues, even though they are not qualities for which we have a name. Aristotle remarks, for example, that the mean state with respect to anger has no name in Greek (1125b26-7). Though he is guided to some degree by distinctions captured by ordinary terms, his methodology allows him to recognize states for which no names exist.

So far from offering a decision procedure, Aristotle insists that this is something that no ethical theory can do. His theory elucidates the nature of virtue, but what must be done on any particular occasion by a virtuous agent depends on the circumstances, and these vary so much from one occasion to another that there is no possibility of stating a series of rules, however complicated, that collectively solve every practical problem. This feature of ethical theory is not unique; Aristotle thinks it applies to many crafts, such as medicine and navigation (1104a7-10). He says that the virtuous person "sees the truth in each case, being as it were a standard and measure of them" (1113a32-3); but this appeal to the good person's vision should not be taken to mean that he has an inarticulate and incommunicable insight into the truth. Aristotle thinks of the good person as someone who is good at deliberation, and he describes deliberation as a process of rational inquiry. The intermediate point that the good person tries to find is "determined by *logos* ("reason," "account") and in the way that the person of practical reason would determine it" (1107a1-2). To say that such a person "sees" what to do is simply a way of registering the point that the good person's reasoning does succeed in discovering what is best in each situation. He is "as it were a standard

and measure" in the sense that his views should be regarded as authoritative by other members of the community. A standard or measure is something that settles disputes; and because good people are so skilled at discovering the mean in difficult cases, their advice must be sought and heeded.

Although there is no possibility of writing a book of rules, however long, that will serve as a complete guide to wise decision-making, it would be a mistake to attribute to Aristotle the opposite position, namely that every purported rule admits of exceptions, so that even a small rule-book that applies to a limited number of situations is an impossibility. He makes it clear that certain emotions (spite, shamelessness, envy) and actions (adultery, theft, murder) are always wrong, regardless of the circumstances (1107a8-12). Although he says that the names of these emotions and actions convey their wrongness, he should not be taken to mean that their wrongness derives from linguistic usage. He defends the family as a social institution against the criticisms of Plato (*Politics* II.3-4), and so when he says that adultery is always wrong, he is prepared to argue for his point by explaining why marriage is a valuable custom and why extra-marital intercourse undermines the relationship between husband and wife. He is not making the tautological claim that wrongful sexual activity is wrong, but the more specific and contentious point that marriages ought to be governed by a rule of strict fidelity. Similarly, when he says that murder and theft are always wrong, he does not mean that wrongful killing and taking are wrong, but that the current system of laws regarding these matters ought to be strictly enforced. So, although Aristotle holds that ethics cannot be reduced to a system of rules, however complex, he insists that some rules are inviolable.

C. The Starting Point for Practical Reasoning

We have seen that the decisions of a practically wise person are not mere intuitions, but can be justified by a chain of reasoning. (This is why Aristotle often talks in term of a practical syllogism, with a major premise that identifies some good to be achieved, and a minor premise that locates the good in some present-to-hand situation.) At the same time, he is acutely aware of the fact that reasoning can always be traced back to a starting point that is not itself justified by further reasoning. Neither good theoretical reasoning nor good practical reasoning moves in a circle; true thinking always presupposes and progresses in linear fashion from proper starting points. And that leads him to ask for an account of how the proper starting points of reasoning are to be determined. Practical reasoning always presupposes that one has some end, some goal one is trying to achieve; and the task of reasoning is determine how that goal is to be accomplished. (This need not be means-end reasoning in the conventional sense; if, for example, our goal is the just resolution of a conflict, we must determine what constitutes justice in these particular circumstances. Here we are engaged in ethical inquiry, and are not asking a purely instrumental question.) But if practical reasoning is correct only if it begins from a correct premise, what is it that insures the correctness of its starting point?

Aristotle replies: "Virtue makes the goal right, practical wisdom the things leading to it" (1144a7-8). By this he cannot mean that there is no room for reasoning about our ultimate end. For as we have seen, he gives a reasoned defense of his conception of happiness as virtuous activity. What he must have in mind, when he says that virtue makes the goal right, is that deliberation typically proceeds from a goal that is far more specific than the goal of attaining happiness by acting virtuously. To be sure, there may be

occasions when a good person approaches an ethical problem by beginning with the premise that happiness consists in virtuous activity. But more often what happens is that a concrete goal presents itself as his starting point -- helping a friend in need, or supporting a worthwhile civic project. Which specific project we set for ourselves is determined by our character. A good person starts from worthwhile concrete ends because his habits and emotional orientation have given him the ability to recognize that such goals are within reach, here and now. Those who are defective in character may have the rational skill needed to achieve their ends -- the skill Aristotle calls cleverness (1144a23-8) -- but often the ends they seek are worthless. The cause of this deficiency lies not in some impairment in their capacity to reason -- for we are assuming that they are normal in this respect -- but in the training of their passions.

6. Intellectual Virtues

Since Aristotle often calls attention to the imprecision of ethical theory (see e.g. 1104a1-7), it comes as a surprise to many readers of the *Ethics* that he begins Book VI with the admission that his earlier statements about the mean need supplementation because they are not yet clear (*saphes*). In every practical discipline, the expert aims at a mark and uses right reason to avoid the twin extremes of excess and deficiency. But what is this right reason, and by what standard (*horos*) is it to be determined? Aristotle says that unless we answer that question, we will be none the wiser -- just as a student of medicine will have failed to master his subject if he can only say that the right medicines to administer are the ones that are prescribed by medical expertise, but has no standard other than this (1128b18-34).

It is not easy to understand the point Aristotle is making here. Has he not already told us that there can be no complete theoretical guide to ethics, that the best one can hope for is that in particular situations one's ethical habits and practical wisdom will help one to determine what to do? Furthermore, Aristotle nowhere announces, in the remainder of Book VI, that we have achieved the greater degree of accuracy that he seems to be looking for. The rest of this Book is a discussion of the various kinds of intellectual virtues: theoretical wisdom, science (*epistêmê*), intuitive understanding (*nous*), practical wisdom, and craft expertise. Aristotle explains what each of these states of mind is, draws various contrasts among them, and takes up various questions that can be raised about their usefulness. At no point does he explicitly return to the question he raised at the beginning of Book VI; he never says, "and now we have the standard of right reason that we were looking for." Nor is it easy to see how his discussion of these five intellectual virtues can bring greater precision to the doctrine of the mean.

We can make some progress towards solving this problem if we remind ourselves that at the beginning of the *Ethics*, Aristotle describes his inquiry as an attempt to develop a better understanding of what our ultimate aim should be. The sketchy answer he gives in Book I is that happiness consists in virtuous activity. In Books II through V, he describes the virtues of the part of the soul that is rational in that it can be attentive to reason, even though it is not capable of deliberating. But precisely because these virtues are rational only in this derivative way, they are a less important component of our ultimate end than is the intellectual virtue -- practical wisdom -- with which they are integrated. If what we know about virtue is only what is said in Books II through V, then our grasp of our ultimate end is radically incomplete, because we still have not studied the intellectual virtue that enables us to reason well in any given

situation. One of the things, at least, towards which Aristotle is gesturing, as he begins Book VI, is practical wisdom. This state of mind has not yet been analyzed, and that is one reason why he complains that his account of our ultimate end is not yet clear enough.

But is practical wisdom the only ingredient of our ultimate end that has not yet been sufficiently discussed? Book VI discusses five intellectual virtues, not just practical wisdom, but it is clear that at least one of these -- craft knowledge -- is considered only in order to provide a contrast with the others. Aristotle is not recommending that his readers make this intellectual virtue part of their ultimate aim. But what of the remaining three: science, intuitive understanding, and the virtue that combines them, theoretical wisdom? Are these present in Book VI only in order to provide a contrast with practical wisdom, or is Aristotle saying that these too must be components of our goal? He does not fully address this issue, but it is evident from several of his remarks in Book VI that he takes theoretical wisdom to be a more valuable state of mind than practical wisdom. "It is strange if someone thinks that politics or practical wisdom is the most excellent kind of knowledge, unless man is the best thing in the cosmos" (1141a20-22). He says that theoretical wisdom produces happiness by being a part of virtue (1144a3-6), and that practical wisdom looks to the development of theoretical wisdom, and issues commands for its sake (1145a8-11). So it is clear that exercising theoretical wisdom is a more important component of our ultimate goal than practical wisdom.

Even so, it may still seem perplexing that these two intellectual virtues, either separately or collectively, should somehow fill a gap in the doctrine of the mean. Having read Book VI and completed our study of what these two forms of wisdom are, how are we better able to succeed in finding the mean in particular situations?

The answer to this question may be that Aristotle does not intend Book VI to provide a full answer to that question, but rather to serve as a prolegomenon to an answer. For it is only near the end of Book X that he presents a full discussion of the relative merits of these two kinds of intellectual virtue, and comments on the different degrees to which each needs to be provided with resources. In X.7-8, he argues that the happiest kind of life is that of a philosopher -- someone who exercises, over a long period of time, the virtue of theoretical wisdom, and has sufficient resources for doing so. (We will discuss these chapters more fully in section 10 below.) One of his reasons for thinking that such a life is superior to the second-best kind of life -- that of a political leader, someone who devotes himself to the exercise of practical rather than theoretical wisdom -- is that it requires less external equipment (1178a23-b7). Aristotle has already made it clear in his discussion of the ethical virtues that someone who is greatly honored by his community and commands large financial resources is in a position to exercise a higher order of ethical virtue than is someone who receives few honors and has little property. The virtue of magnificence is superior to mere liberality, and similarly greatness of soul is a higher excellence than the ordinary virtue that has to do with honor. (These qualities are discussed in IV.1-4.) The grandest expression of ethical virtue requires great political power, because it is the political leader who is in a position to do the greatest amount of good for the community. The person who chooses to lead a political life, and who aims at the fullest expression of practical wisdom, has a standard for deciding what level of resources he needs: he should have friends, property, and honors in sufficient quantities to allow his practical wisdom to express itself without impediment. But if one chooses instead the life of a philosopher, then one will look to a

different standard -- the fullest expression of theoretical wisdom -- and one will need a smaller supply of these resources.

This enables us to see how Aristotle's treatment of the intellectual virtues does give greater content and precision to the doctrine of the mean. The best standard is the one adopted by the philosopher; the second-best is the one adopted by the political leader. In either case, it is the exercise of an intellectual virtue that provides a guideline for making important quantitative decisions. This supplement to the doctrine of the mean is fully compatible with Aristotle's thesis that no set of rules, no matter how long and detailed, obviates the need for deliberative and ethical virtue. If one chooses the life of a philosopher, one should keep the level of one's resources high enough to secure the leisure necessary for such a life, but not so high that one's external equipment becomes a burden and a distraction rather than an aid to living well. That gives one a firmer idea of how to hit the mean, but it still leaves the details to be worked out. The philosopher will need to determine, in particular situations, where justice lies, what generosity requires, when courage requires meeting a danger, and so on. All of the normal difficulties of ethical life remain, and they can be solved only by means of a detailed understanding of the particulars of each situation. Having philosophy as one's ultimate aim does not put an end to the need for developing and exercising practical wisdom and the ethical virtues.

7. *Akrasia*

In VII.1-10 Aristotle investigates character traits -- continence and incontinence -- that are not as blameworthy as the vices but not as praiseworthy as the virtues. (We began our discussion of these qualities in section 4.) The Greek terms are *akrasia* ("incontinence"; literally: "lack of mastery") and *enkrateia* ("continence"; literally "mastery"). An akratic person goes against reason as a result of some *pathos* ("emotion," "feeling"). Like the akratic, an enkratic person experiences a feeling that is contrary to reason; but unlike the akratic, he acts in accordance with reason. His defect consists solely in the fact that, more than most people, he experiences passions that conflict with his rational choice. The akratic person has not only this defect, but has the further flaw that he gives in to feeling rather than reason more often than the average person.

Aristotle distinguishes two kinds of akrasia: impetuosity (*propeteia*) and weakness (*astheneia*). The person who is weak goes through a process of deliberation and makes a choice; but rather than act in accordance with his reasoned choice, he acts under the influence of a passion. By contrast, the impetuous person does not go through a process of deliberation and does not make a reasoned choice; he simply acts under the influence of a passion. At the time of action, the impetuous person experiences no internal conflict. But once his act has been completed, he regrets what he has done. One could say that he deliberates, if deliberation were something that post-dated rather than preceded action; but the thought process he goes through after he acts comes too late to save him from error.

It is important to bear in mind that when Aristotle talks about impetuosity and weakness, he is discussing chronic conditions. The impetuous person is someone who acts emotionally and fails to deliberate not just once or twice but with some frequency; he makes this error more than most people do. Because of this

pattern in his actions, we would be justified in saying of the impetuous person that had his passions not prevented him from doing so, he would have deliberated and chosen an action different from the one he did perform.

The two kinds of passions that Aristotle focuses on, in his treatment of *akrasia*, are the appetite for pleasure and anger. Either can lead to impetuosity and weakness. But Aristotle gives pride of place to the appetite for pleasure as the passion that undermines reason. He calls the kind of *akrasia* caused by an appetite for pleasure "unqualified *akrasia*" -- or, as we might say, *akrasia* "full stop"; *akrasia* caused by anger he considers a qualified form of *akrasia* and calls it *akrasia* "with respect to anger". We thus have these four forms of *akrasia*: (A) impetuosity caused by pleasure, (B) impetuosity caused by anger, (C) weakness caused by pleasure (D) weakness caused by anger. It should be noticed that Aristotle's treatment of *akrasia* is heavily influenced by Plato's tripartite division of the soul in the *Republic*. Plato holds that either the spirited part (which houses anger, as well as other emotions) or the appetitive part (which houses the desire for physical pleasures) can disrupt the dictates of reason and result in action contrary to reason. The same threefold division of the soul can be seen in Aristotle's approach to this topic.

Although Aristotle characterizes *akrasia* and *enkrateia* in terms of a conflict between reason and feeling, his detailed analysis of these states of mind shows that what takes place is best described in a more complicated way. For the feeling that undermines reason contains some thought, which may be implicitly general. As Aristotle says, anger "reasoning as it were that one must fight against such a thing, is immediately provoked"(1149a33-4). And although in the next sentence he denies that our appetite for pleasure works in this way, he earlier had said that there can be a syllogism that favors pursuing enjoyment: "Everything sweet is pleasant, and this is sweet" leads to the pursuit of a particular pleasure (1147a31-30). Perhaps what he has in mind is that pleasure can operate in either way: it can prompt action unmediated by a general premise, or it can prompt us to act on such a syllogism. By contrast, anger always moves us by presenting itself as a bit of general, although hasty, reasoning.

But of course Aristotle does not mean that a conflicted person has more than one faculty of reason. Rather his idea seems to be that in addition to our full-fledged reasoning capacity, we also have psychological mechanisms that are capable of a limited range of reasoning. When feeling conflicts with reason, what occurs is better described as a fight between feeling-allied-with-limited-reasoning and full-fledged reason. Part of us -- reason -- can remove itself from the distorting influence of feeling and consider all relevant factors, positive and negative. But another part of us -- feeling or emotion -- has a more limited field of reasoning -- and sometimes it does not even make use of it.

Although "passion" is sometimes used as a translation of Aristotle's word *pathos* (other alternatives are "emotion" and "feeling"), it is important to bear in mind that his term does not necessarily designate a strong psychological force. Anger is a *pathos* whether it is weak or strong; so too is the appetite for bodily pleasures. And he clearly indicates that it is possible for an akratic person to be defeated by a weak *pathos* -- the kind that most people would easily be able to control (1150a9-b16). So the general explanation for the occurrence of *akrasia* cannot be that the strength of a passion overwhelms reason. Aristotle should therefore be acquitted of an accusation made against him by J.L. Austin in a well-known footnote to his paper, "A Plea For Excuses." Plato and Aristotle, he says, collapsed all succumbing to temptation into

losing control of ourselves -- a mistake illustrated by this example: "I am very partial to ice cream, and a bombe is served divided into segments corresponding one to one with the persons at High Table: I am tempted to help myself to two segments and do so, thus succumbing to temptation and even conceivably (but why necessarily?) going against my principles. But do I lose control of myself? Do I raven, do I snatch the morsels from the dish and wolf them down, impervious to the consternation of my colleagues? Not a bit of it. We often succumb to temptation with calm and even with finesse." (*Philosophical Papers*, 1961, p. 146.) With this, Aristotle can agree: the *pathos* for the bombe can be a weak one, and in some people that will be enough to get them to act in a way that is disapproved by their reason at the very time of action.

What is most remarkable about Aristotle's discussion of *akrasia* is that he defends a position close to that of Socrates. When he first introduces the topic of *akrasia*, and surveys some of the problems involved in understanding this phenomenon, he says (1145b25-8) that Socrates held that there is no *akrasia*, and he describes this as a thesis that clearly conflicts with the appearances (*phainomena*). Since he says that his goal is to preserve as many of the appearances as possible (1145b2-7), it may come as a surprise that when he analyzes the conflict between reason and feeling, he arrives at the conclusion that in a way Socrates was right after all (1147b13-17). For, he says, the person who acts against reason does not have what is thought to be unqualified knowledge; in a way he has knowledge, but in a way does not.

Aristotle explains what he has in mind by comparing *akrasia* to the condition of other people who might be described as knowing in a way, but not in an unqualified way. His examples are people who are asleep, mad, or drunk; he also treats the akratic as someone like a student who has just begun to learn a subject, or an actor on the stage (1147a10-24). All of these people, he says, can utter the very words used by those who have knowledge; but their talk does not prove that they really have knowledge, strictly speaking.

These analogies can be taken to mean that the form of *akrasia* that Aristotle calls weakness rather than impetuosity always results from some diminution of cognitive or intellectual acuity at the moment of action. The akratic says, at the time of action, that he ought not to indulge in this particular pleasure at this time. But does he know or even believe that he should refrain? Aristotle might be taken to reply: yes and no. He has some degree of recognition that he must not do this now, but not full recognition. His feeling, even if it is weak, has to some degree prevented him from completely grasping or affirming the point that he should not do this. And so in a way Socrates was right. When reason remains unimpaired and unclouded, its dictates will carry us all the way to action, so long as we are able to act.

But Aristotle's agreement with Socrates is only partial, because he insists on the power of the emotions to rival, weaken or bypass reason. Emotion challenges reason in all three of these ways. In both the akratic and the enkratic, it competes with reason for control over action; even when reason wins, it faces the difficult task of having to struggle with an internal rival. Second, in the akratic, it temporarily robs reason of its full acuity, thus handicapping it as a competitor. It is not merely a rival force, in these cases; it is a force that keeps reason from fully exercising its power. And third, passion can make someone impetuous; here its victory over reason is so powerful that the latter does not even enter into the arena of conscious reflection until it is too late to influence action.

8. Pleasure

Aristotle frequently emphasizes the importance of pleasure to human life and therefore to his study of how we should live (see for example 1099a7-20 and 1104b3-1105a16), but his full-scale examination of the nature and value of pleasure is found in two places: VII.11-14 and X.1-5. It is odd that pleasure receives two lengthy treatments; no other topic in the *Ethics* is revisited in this way. Book VII of the *Nicomachean Ethics* is identical to Book VI of the *Eudemian Ethics*; for unknown reasons, the editor of the former decided to include within it both the treatment of pleasure that is unique to that work (X.1-5) and the study that is common to both treatises (VII.11-14). The two accounts are broadly similar. They agree about the value of pleasure, defend a theory about its nature, and oppose competing theories. Aristotle holds that a happy life must include pleasure, and he therefore opposes those who argue that pleasure is by its nature bad. He insists that there are other pleasures besides those of the senses, and that the best pleasures are the ones experienced by virtuous people who have sufficient resources for excellent activity.

Book VII offers a brief account of what pleasure is and is not. It is not a process but an unimpeded activity of a natural state (1153a7-17). Aristotle does not elaborate on what a natural state is, but he obviously has in mind the healthy condition of the body, especially its sense faculties, and the virtuous condition of the soul. Little is said about what it is for an activity to be unimpeded, but Aristotle does remind us that virtuous activity is impeded by the absence of a sufficient supply of external goods (1153b17-19). One might object that people who are sick or who have moral deficiencies can experience pleasure, even though Aristotle does not take them to be in a natural state. He has two strategies for responding. First, when a sick person experiences some degree of pleasure as he is being restored to health, the pleasure he is feeling is caused by the fact that he is no longer completely ill. Some small part of him is in a natural state and is acting without impediment (1152b35-6). Second, Aristotle is willing to say that what seems pleasant to some people may in fact not be pleasant (1152b31-2), just as what tastes bitter to an unhealthy palate may not be bitter. To call something a pleasure is not only to report a state of mind but also to endorse it to others. Aristotle's analysis of the nature of pleasure is not meant to apply to every case in which something seems pleasant to someone, but only to activities that really are pleasures. All of these are unimpeded activities of a natural state.

It follows from this conception of pleasure that every instance of pleasure must be good to some extent. For how could an unimpeded activity of a natural state be bad or a matter of indifference? On the other hand, Aristotle does not mean to imply that every pleasure should be chosen. He briefly mentions the point that pleasures compete with each other, so that the enjoyment of one kind of activity impedes other activities that cannot be carried out at the same time (1153a20-22). His point is simply that although some pleasures may be good, they are not worth choosing when they interfere with other activities that are far better. This point is developed more fully in *Ethics* X.5.

Furthermore, Aristotle's analysis allows him to speak of certain pleasures as "bad without qualification"

(1152b26-33), even though pleasure is the unimpeded activity of a natural state. To call a pleasure "bad without qualification" is to insist that it should be avoided, but allow that nonetheless it should be chosen in constraining circumstances. The pleasure of recovering from an illness, for example, is bad without qualification -- meaning that it is not one of the pleasures one would ideally choose, if one could completely control one's circumstances. Although it really is a pleasure and so something can be said in its favor, it is so inferior to other goods that ideally one ought to forego it. Nonetheless, it is a pleasure worth having -- if one adds the qualification that it is only worth having in undesirable circumstances. The pleasure of recovering from an illness is good, because some small part of oneself is in a natural state and is acting without impediment; but it can also be called bad, if what one means by this is that one should avoid getting into a situation in which one experiences that pleasure.
